3. It is also a treatment which lends itself equally well, so far as architectural considerations are concerned, to very different treatments of the ground spaces, including the quadrangle, as in the Boston Public Library; the interior courts in buildings treated like the Library of Congress; the stack in the interior of the building, as in the Chicago Public Library; the stack built parallel to the main building, or even absorbed in it, architecturally, as in the Fall River instance, and the stack built at right angles to the main building, as in the Kansas City, Newark and Providence instances. In the last-named instance—Providence—where the stack building is compelled, by the nature of the library lot, to be a prominent architectural feature, the treatment of this "refreshing" problem—to quote Mr. Russell Sturgis—has been conspicuously successful, from an architectural as well as a practical point of view.

4. It is a type of architecture which lends itself well to the demands of purely practical considerations, such as lighting, ventilation and arrangement.

While it is true, as stated above, that this is a type which possesses many obvious advantages for library purposes, it does not by any means follow that it should be regarded as the exclusively "library" architectural type. When such a feature as a dome is rendered necessary, it combines well with the other features of this type, but when prominently in sight, with the inevitable result of something distinctly different in effect. This may be seen in the Library of Congress, the Wisconsin State Historical Society Building, the Milwaukee Public Library and Museum, and other instances. The Columbia University Library Building, one of the most exquisitely beautiful buildings recently erected in America for any purpose, while it is of the Renaissance style of architecture, has nothing in common with the type above referred to, the dome in this instance being one which very distinctly emphasises height.

Finally, in touching on the details of library arrangement, it should be said that the library building of the future will of necessity cover more space than has been planned for in the past, quite independently of the question of the constantly increasing number of volumes. Rooms such as the children's reading-room, the art-room and the lecture-room are here to stay, and must be reckoned with in plans for any library of the larger size. But, more than that, provision must be made for a large use of the books on the premises in such rooms as study-rooms, reference-rooms, classrooms, &c.

It is evident from a study of these recent buildings that the stack is not yet eliminated as a feature in library arrangements and construction. Yet it is noteworthy that the movement in the direction of open shelves is very well entrenched, even in those libraries which have a stack. Thus, to take what is perhaps an average case, the Providence Public Library will have at least two-fifths of its volumes elsewhere than in the stack, these volumes being accessible on open shelves in such rooms as the reference-room, the art-room, the patent-room, the medical library, the educational library, &c. (and an even more striking result has been reached in the Newark building).

One other feature of library arrangement should here be mentioned, namely, the delivery-room. It seems like a truism to say that it should be in close contact with the stack, yet the experience of one of the largest libraries in the country shows that the statement is not wholly unnecessary. Acting on the principle that a straight line is the shortest distance between two points, we might naturally wish not only to place the delivery desk at the intersection of all the lines in a horizontal plane, as in the Library of Congress, but also at the centre, so far as the vertical lines are concerned. The library of Cornell University makes an interesting approach to this ideal. The delivery-desk is not only at the point of junction of two stacks running at right angles to each other, but it is midway of the distance from top to bottom of the seven storey stack, owing to the sharp descent of the hill on which it is built. The Providence Public Library cannot reproduce these conditions, owing to the much less decided slope of the hill, but it makes as close an approximation to it as it can. The delivery-room projects into the stack itself as a tenon extends into a mortise, so that there are stack floors above and below the delivery-desk as well as just beyond it.

A REGISTER OF OLD LONDON.

FROM time to time, says a correspondent of the *Times*, London learns through the Press of the impending destruction of some memorial of its past. Sometimes it is a spot sung of poets, such as the Tabard in Southwark; sometimes a relic of a bygone phase of life—an Inn of Chancery, an old pleasure garden; sometimes a specimen of the work of a great architect. Occasionally public feeling is aroused, strenuous efforts are made, and the threatened blow is averted or delayed. The contest over the Trinity Almshouses at Mile End and its successful issue are fresh in the public mind. Staple Inn, put up for sale as a building estate, was a few years since rescued by the generous intervention of the Prudential Insurance Company. Parliament refused to ruin the Charterhouse. But too often the news comes too late to admit of intervention, and in cases intervention is impossible. Lady Dacre's Hospital at Westminster, the quiet beauty of which is said to have inspired Fred Walker's "Haven of Rest," and the old Palace of Bromley-by-Bow, one of the few remaining Elizabethan houses of London, have both disappeared during the present decade. These fragments of antiquity were of a more or less public character; buildings in private hands are in still greater danger. The Old Bell in Holborn, with its pit and gallery, has been demolished within the last twelve months. Sir Joshua Reynolds's house in Leicester Fields is threatened. And Hampstead, the suburb which, rich in associations, in natural beauty and in quaint village-like nooks and corners, most resolutely resists absorption in the Metropolis, sees one of its characteristic features, Church Row, invaded by the modern pile of flats. Some of these changes cannot be prevented. But a little consideration and careful planning may sometimes save the charm of a building without interfering with its money-making capacities. Everything has its value in a complex community like London, and there is a certain market-price for quaintness and antiquity, perhaps for architectural beauty. Thus, even where purely private interests are concerned, something may now and again be done to avert needless destruction; where public bodies can be appealed to there is better hope. But at present there is a serious preliminary difficulty in the absence of definite and easily accessible information respecting Old London, and of any machinery for insuring timely warning of a threatened danger.

It is satisfactory to learn that an attempt has lately been made to meet this want. As might have been expected, the society which the late Mr. William Morris organised for the protection of ancient buildings is the home of the movement. Some three years ago a company in connection with this society was formed for the purpose of compiling a register of all objects of an historic or æsthetic nature within an area bounded on the south by the Thames and extending northwards and eastwards twenty miles from Aldgate. Buildings are

of course, the primary care of the committee, but it extends its survey to any interesting relic—an open space, a beautiful tree, "any interesting piece of handicraft, if it be but a sign-board or wrought-iron gate." The methods of the committee are exact and business-like. The position of the building or other object, its owner and occupiers and condition of repair, a careful description of its character and dates, notes as to its history and reference to any books which treat of it are all entered in a schedule. These particulars are illustrated by sketches, photographs and measured drawings, which are arranged in albums according to parishes. The fulness with which the committee performs its task may be estimated from the fact that, while some two hundred places have been the subject of examination and report, no fewer than a thousand drawings, photographs and sketches have been made. It is obvious that, if the work is completed on the same scale, it will eventually, as the committee state, form "a unique collection of what Greater London at the close of the present century still retained of historic interest or beauty." The fact that Lord Leighton was president of the committee, and that such names as Walter Crane, Mr. Philip Norman, Mr. Hamo Thornycroft, Mr. Humphry Ward and Sir Walter Besant appear on the list of its supporters, is a guarantee of the thoroughness of the work. Its chairman and organiser is Mr. C. R. Ashbee. It is the design of the committee—which possesses a long name but prefers to be called the "watch committee"—to publish not only the register in suitable parts, but separate monographs on places of especial interest. One of these has already seen the light. Its subject was the Trinity Hospital, Mile End. And here the practical as well as the literary value of the committee's work is well seen. For it was owing to information obtained by the watch committee in the course of its work that attention was drawn to the proposal of the Elder Brethren of the Trinity House to sell the hospital and remove its inmates—a proposal eventually negatived by the Charity Commissioners upon the opposition of many societies. Again, the State Room in the old palace of Bromley-by-Bow (the subject of another monograph) was at the instance of the committee moved to South Kensington, and an attempt to pull down Bow Church for the widening of the thoroughfare was foiled through an appeal to the London County Council.

But the most remarkable outcome of the committee's work has still to be mentioned. In December last it induced the London County Council to call together representatives of the several societies interested in Old London. At a conference between such representatives and a committee of the Council it was decided to be desirable that a "register or list be made of buildings of historic or architectural interest in London," and that a permanent committee, to consist of members of the Council and of outside bodies, be constituted for the purpose. The work of the watch committee was, moreover, adopted as the foundation for the official register, portions of which will in due course be published. Further, by an Act of this Session the Council has obtained power to preserve Old London, either by the purchase (by agreement) of buildings and places of historical or architectural interest, or by entering into arrangements for the maintenance and management of such buildings and places. As the Council is itself constantly engaged in carrying out or authorising schemes which involve serious changes, it is something to know that the importance of preserving, so far as possible, what is interesting or beautiful will not be lost sight of in such operations. But, apart from this, it is a notable step in advance to have secured the recognition by a powerful executive body of considerations which have often been contemned as merely sentimental. Throughout most of the countries of Europe there are authoritative registers of antiquities, and commissions charged with the duty of fostering respect for, and interest in, these legacies of time. The only similar attempt in this country is embodied in Sir John Lubbock's Act for the Protection of Ancient Monuments, but its scope is singularly narrow, embracing only monuments of the megalithic order. It is to be hoped that the many societies interested in such questions (with the powerful aid, now secured, of the London County Council) may be instrumental in extending the protection of organised public sentiment to a much larger class of interesting remains; and there cannot be a more fitting centre in which to begin such work than the ancient and historic capital of the empire.

THE MEXICAN COMPETITION.

A CORRESPONDENT of the American *Architect*, writing from Mexico, gives the following account of the recent competition :—

The competition for the Legislative Palace for the general government of the Republic of Mexico has been decided by the jury of award, and although the promised official report of the jury has not been published in the *Diario Official*, the general proceedings and results of the competition are now public property.

The limited portion of the Mexican people that keeps informed of important public matters has taken an unusual interest in this competition, and it has seemed to be the opinion, even among some educated engineers and architects, that the jury would be almost deluged with designs from many of the leading architects of the world. They must have been disagreeably surprised, if they really understand, that, with the exception of that of Piocentini and Nataletti, not a design was received from even an architect of note in his own country, and that, with possibly one exception, no Mexican architect of note participated in the competition, although this capital can count quite a number of scholarly architects of large experience in their style of building. The reason for the non-participation of leading architects was freely expressed by the writer to some of the profession as soon as the programme was published. That the result has more than confirmed his predictions cannot be doubted. To the architect who has followed the courses of competitions on this continent and in Europe these reasons were evident at a glance.

To the authorities, who were evidently honest in their intentions, notwithstanding persistent rumours to the contrary, the result must have been a surprise. In the hope that these lines may come to their notice and be of benefit to them and others, a brief statement of the causes of the failure is submitted. In the first place, an unusually complete set of general working drawings and specifications was demanded, and as a reward there was offered as a possible first prize one-half of 1 per cent. of proposed cost among a probable fifty to seventy-five competitors, a possible one-fifth of 1 per cent. for the next two prizes and a gold and silver medal respectively for the fourth and fifth prizes. The design classed first was to receive an additional one-half of 1 per cent. on making complete detailed plans and specifications for execution of the project.

It ought to be thoroughly impressed upon the authorities here that but few, if any, reputable architects can be induced to make even preliminary drawings at one-half of 1 per cent. unless they are reasonably assured of the commission at a reasonable rate, and that to furnish practically working drawings at this rate, and to gamble among fifty or seventy-five others, with their 5,000 dols. to 7,000 dols. invested in their drawings as a stake, was a preposterous proposition. With this view as to the first prize, what kind of a lottery would it be as to the second, third, fourth and fifth prizes, where the gambler stakes his 5,000 dols. to 7,000 dols. value of drawings against a chance of one in seventy-five to 2,000 pesos or a medal? Again, it may be possible that those who had been burned by contact with the fire of previous competitions noted that while three of the jury were directly selected by different departments of the Government, the four others were to be elected by the competitors from a list of ten experts proposed by the Ministry of Public Works, which practically, in spite of its seeming fairness, put the whole matter under the control of the Government, and unfortunately, when it came to the selection of the ten from whom to choose, none but Mexican engineers were in the list. Add to the above the fact that not the slightest information was given as to the nature of the soil at the site, although an accurate distribution of pressures on foundations was required, and there is presented a rather difficult and indefinite proposition to solve.

Designs were received up to April 1, 1898, and one was even received after that date, when, as it had been stated by the Press of the city, the jury had already reached a decision. These drawings were all accepted on equal terms with those received on or before November 30, 1897, the statement being made that they were deposited with some Mexican foreign representative before the date last named, though it does seem a little mysterious how it could require from two to four months for so many of them to reach this city. The awards made by the jury were as follows :—

No. 17. Motto "St. Georgius, Equitum Patronus," architect, Adam Boori, second prize.

No. 26. Motto "Minerva's Head," architect, J. P. Weber, Chicago, second prize.

No. 44. Motto "Roma, Mexico," architects, Pio Piocentini and Philippo Nataletti, second prize.

No. 52. Motto "Majestas," architect, Pietro Paolo Quaglia, Mexico, third prize.

No. 18. Motto "Golden Star," architect, Antonio Rivas Mercado, fourth prize—gold medal.

No. 45. Motto "Roma, Roma," architect, ———, fifth prize, silver medal.

None of the premiated designs showed indications of various loads on foundations, only one design, in an obscure corner, making a feeble attempt to comply with this requirement.

Aside from those premiated, there were not to exceed two or three designs worthy of even a passing glance. The authors of the remainder may be classed as young or struggling architects, civil engineers with no experience in design, con-

tractors and wall-paper artists. Many of the drawings were such crude pencil sketches that it was impossible to decipher the intentions of the authors. The designs were exhibited to the public in the colonnaded patio of the old Custom House, which was roofed with white cotton cloth, thus giving a strong well-diffused light from above only. The patio was divided by numerous low partitions against which the plans were arranged, and t would have been difficult to show them to better advantage. The rendering of the elevations and perspectives of the premiated designs was fairly good, those of Piocentini and Nataletti being especially noteworthy for the delicate treatment of pen-and-ink work in a warm brown colour. Owing to the restrictions of the site there seems to be but little originality and variety in the planning. No. 26 suggests the ever-recurring type of what might be called the standard American State house.

No. 18 had a very complete set of drawings, and seemed to be the great favourite among the younger engineers and architects of the city. Its lettering was a mixture of English, French and Spanish. The borders and lettering of sheets were in the Mexican national colours. From these and other indications it might have been the work of some syndicate of young architects.

No specifications or estimates were to be had by the public.

It is the opinion of many good judges that the cost of any of the premiated designs would have exceeded by 50 per cent. the limit of 1,500,000 pesos of the programme, and that some would cost double that sum.

The jury unanimously decided at first not to award the first prize to any of the competitors, as none of them had complied with the programme of the competition, and also voted, as before indicated, to divide the second prize of 6,000 pesos among the three named as entitled to that position. At a subsequent meeting the jury reconsidered this action, and voted to divide the 15,000 pesos, first prize, among the three named for second place.

This certainly shows a generous and just intention on the part of the Government, for by a strict interpretation of the programme not one competitor was entitled to a prize, and it further goes to strengthen the opinion, expressed elsewhere, that the promoters and jury were actuated by just motives and only erred from lack of experience in such matters.

On the whole, this is another case where the promoters, had they been compelled to read your exhaustive article on competitions before undertaking this affair, might have derived from it incalculable value to themselves and to those they endeavoured to serve.

There is at present no information obtainable as to when, if ever, and after which design the building is to be proceeded with. The limits of the site are being marked by a wall of adobes showing the elliptical shape, but this has been going on for five or six months and in this manana-land is no indication of definite progress.

YORK MINSTER.

THE Dean of York has just issued an appeal for funds for the preservation of York Minister. He expresses a hope that all who value and appreciate the building will not only watch with interest the work now in progress, but contribute to the funds required, the present sum at the disposal of the Dean and Chapter being quite inadequate to meet the severe strain upon them. The Dean states that the work on the south side of the nave has already been completed and the grand pinnacles have been accurately restored. The work at the east end will be completed in about twelve months, when there will be commenced a similar work at the west end. The report of the clerk of the works, which is appended to the appeal, gives particulars of the extent to which decay has damaged many parts of the building.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL SOCIETY.

THE fourth meeting for the year 1898 will be held on Friday, August 19, at Mount Grace Priory. Members will assemble at Northallerton Station at 10.43. They will drive to Mount Grace (8 miles) by way of Kirby Sigston, where the church with its Norman nave and ancient heraldic glass in east window will be examined. At Mount Grace the extensive ruins of the Carthusian Priory will be pointed out by the owner, Mr. William Brown, whose researches have been specially directed to the monastic establishments of this part of Yorkshire. The buildings consist of church, prison house, outer and inner courts with the cells and gardens, kitchen and gate-house. During the last two years important excavations have been made which have thrown great light on the arrangements of the building, during which the tomb of the founder, Thomas, Duke of Surrey, has been laid bare. There is also a large dwelling-house adjoining which is a good example of the seventeenth-century work. Members will return either by Osmotherley or Leake if time will allow, and will reach Northallerton in time for dinner at the Golden Lion.

TESSERÆ.

Symmetry in Objects.

THERE is a kind of beauty in invisible objects which is commonly, but perhaps falsely, supposed to speak to the eye; this is that kind of symmetry or uniformity which consists in an exact correspondence of form between the two halves of an object. To distinguish it from other kinds of uniformity we will call it "the uniformity of halves." We need hardly observe that it is the most universal quality in nature pervading all ranks of organic life, from the leaf and the flower up to man, and all separate and distinct creatures, even when inorganic, from a crystal to a world. Accordingly, man has in all ages and countries imitated this principle of nature to the very best of his power, in every work that was intended to appear one separate and complete whole; and though some late critics have told us that a building containing distinct apartments is to be regarded as a collection of several things and treated accordingly, the world will never believe a mere assertion against the plain example of nature, whose practice it is, in an animal having no uniformity of internal parts (a heart on this side, a liver on that, and a stomach placed unsymmetrically), nevertheless to contrive the external form with an exact correspondence of halves. Though we constantly speak of this quality as being pleasing to the eye, there seems to be a continual proof that it has nothing to do with the eye, for when is the image of a uniform object (formed on the retina) uniform? Never in the case of a solid body, because even when the eye is exactly in the central plane of the object, though the outline be uniform, the lights and shades (far more striking to the eye) destroy that uniformity. Thus even the elevation of a uniform building ceases to be a uniform object as soon as it is shadowed. But, besides this, a deviation of the eye from this central plane to any extent is universally thought to increase the beauty of the view, though it destroys the uniformity of the outline and renders it impossible that the ocular image can, under any effect of light and shade, ever be uniform. Thus it appears that the same uniformity which is a beauty in the object is a defect in its image of picture. It is necessary to the enjoyment of this excellence in a building that it be not seen but discovered by the mind.

The Temples of Siva.

The shape of the temples of Siva, the Destroyer, does not differ from those of the other Indian gods. The chief entrance into the great temple is by a high massive pyramid, the top of which has generally the form of a crescent; it invariably faces the east. Beyond the gate there is a large court, at the further extremity of which another gate leads through a pyramid of less height but of the same form. A small yard separates it from the temple of the idol. In the middle of it there is either a huge bull or a linga carved in stone, raised on a pedestal, or put under a canopy supported by four pillars. This is the first object of adoration to the visitors, who then pass through a low narrow door into the inside of the temple. This door is the only passage for light and air, there being no windows. A lamp, which burns night and day, gives a tolerable light. The interior of the building is generally divided into two parts, sometimes into three, the first of which is the most spacious and is destined to receive the people; the second, or the adytum, in which the idol resides, is much smaller and darker, and generally shut, the door being opened only by the officiating priest, who, with some of his attendants, has alone the right of entering this mysterious place for the purpose of washing the image and dressing and bringing offerings to it. This part is often built in the shape of a vault, but it is so low as to make a prolonged stay in it rather oppressive.

Bernini's Sculpture.

The faults and merits of Bernini as a sculptor will be best shown by a reference to and criticism of a few of his best known works. His group of Apollo and Daphne, in the Villa Borghese, is a production of great merit for its invention and power of telling its story. The god has just reached the object of his pursuit, and at the moment when he seizes her Daphne's prayer is heard, and the beautiful form is being metamorphosed into a tree. Instead of generalising this part of the history, Bernini appears to have delighted in the opportunity of showing his skill in execution. The hair and drapery of Apollo are floating in the air, while the change that is to preserve Daphne from violence is shown in detail in her tresses, the toes and fingers becoming elongated into roots and branches, the latter terminating in carefully-worked laurel leaves. St. Peter's at Rome contains various works of this artist. The most remark-

able of these are the splendid monuments of Urban VIII. and Alexander VII., which may be said to exhibit all his excellences and all his defects. The former stands opposite a celebrated work of Guglielmo della Porta, the monument of Pope Paul III., and is a melancholy proof of the consequences of losing sight of purer principles. Della Porta's was not a school of perfection, but the contrast between the grandeur of manner of his time and the handicraft display of Bernini's period is distressing. The composition of the second work alluded to, the monument of Alexander VII., is as strange as the execution is wonderful. The sitting figure of the Pope occupies the centre of a large and deep niche. The whole of the lower part or ground is filled up with curtain and cloud, in the corners of which are plunged four allegorical groups or figures. Of those at the back of the recess but little can be seen except the heads and shoulders. In the front corners are Truth and Charity, the latter a gigantic female, with fleshy infants pressed against her breast, to whose weight the marble appears to yield with all the elasticity of a soft pulpy substance. This work is a triumph of execution, but debased by the worst taste. A group of the Ecstasy of St. Teresa in the church Della Vittoria at Rome is another instance of the want of simplicity. In this it is difficult, amidst the flutter of the drapery and the ample convolution of clouds to discover either the figure of the saint or the subject of the composition. Of the single statues of Bernini, that of David preparing to throw the stone has merit for the earnestness and energy of the expression. The figure is a portrait of the artist, who was very young when he executed this work. His statue of St. Bibiana is also considered one of his best productions; but compared with the St. Cecilia of Stefano Maderno (and the comparison is strictly just, as both represent draped female figures of the same character, lying on the ground) it is an inferior work. The four doctors of the Church supporting the chair of St. Peter in the church of that apostle at Rome is a grand idea, but its effect in execution is injured by the want of simple unaffected expression and attitudes. These statues are colossal. They are cast in bronze, and some parts of the figures and draperies are richly gilt. This composition, taking it altogether, has a magnificent effect. Fontana calculated, from the archives kept in Rome, that this work must have cost 107,000 crowns. The sum expended on the whole edifice up to his time was 46,800,098 crowns, and Cicognara thinks he does not exaggerate when he calculates that a tenth of this was spent on works executed under the direction of Bernini. The fountain in the Piazza Navona at Rome is one of the strange and daring performances of this artist. Cicognara observes of Bernini that he was architect, mechanist, sculptor and founder. He was more than this. In proof of the versatility of his talents mention is made of a theatrical entertainment given by him in Rome, for which he built the theatre, painted the scenes, cast the statues, constructed the engines, wrote the comedy and composed the music.

Contrast in Painting.

The rule of contrasting figures or groups is not only universally known and adopted, but it is frequently carried to excess. The artist is advised not to destroy the grandeur and simplicity of his design by violent and affected contrasts. The artless uniformity of the compositions of the old Gothic painters is far preferable to this false refinement, this ostentatious display of academic art. A greater degree of contrast and variety may be allowed in the picturesque or ornamental style; but we must not forget that they are the natural enemies of simplicity, and consequently of the grand style, and destroy that solemn majesty, that soft repose which is produced in a great measure by regularity and uniformity. Those two qualities are separately exhibited by two great painters, Rubens and Titian. The picture of Rubens is in Antwerp; the subject (if that may be called a subject where no story is represented) is the Virgin and Infant Christ, placed high in the picture on a pedestal, with many saints about them and as many below them, with others on the steps to serve as a link to unite the upper and lower part of the picture. The composition of this picture is perfect in its kind; the artist has shown the greatest skill in disposing and contrasting more than twenty figures without confusion and without crowding, the whole appearing as much animated and in motion as it is possible where nothing is to be done. The picture of Titian which we would oppose to this is in the church of the Frari at Venice. The peculiar character of this piece is grandeur and simplicity, which proceed in a great measure from the regularity of the composition, two of the principal figures being represented kneeling directly opposite to each other, and nearly in the same attitude; this is what few painters would have had the courage to venture. Rubens would certainly have rejected so unpicturesque a mode of composition had it occurred to him. Both these pictures are equally excellent in their kind, and may be said to characterise their respective authors. There is a bustle and animation in the work of Rubens; a quiet, solemn majesty in that of Titian. The excellence of Rubens is the picturesque effect which he produces. The superior merit of Titian is in the appearance of being above seeking after any such artificial excellence.

Treatment of Backgrounds.

By the choice and scenery of the background we are frequently enabled to judge how far a painter entered into his subject, whether he understood its nature, to what class it belonged, what impression it was capable of making, what passion it was calculated to rouse. The sedate, the solemn, the severe, the awful, the terrible, the sublime, the placid, the solitary, the pleasing, the gay, are stamped by it. Sometimes it ought to be negative, entirely subordinate, receding or shrinking into itself; sometimes more positive, it acts, invigorates, assists the subject and claims attention; sometimes its forms, sometimes its colour, ought to command. A subject in itself bordering on the usual or common may become sublime or pathetic by the background alone, and a sublime or pathetic one may become trivial and uninteresting by it. A female leaning her head on her hand on a rock might easily suggest itself to any painter of portrait, but the means of making this figure interesting to those who are not concerned in the likeness were not to be picked from the mixtures of the palette. Reynolds found the secret in contrasting the tranquillity and repose of the person by a tempestuous sea and a stormy shore in the distance, and in another female, contemplating a tremulous sea by a placid moonlight, he connected elegance with sympathy and desire.

GENERAL.

Mr. T. Sopwith, the mining engineer, has died at Lismore in Scotland from the effects of an accident while shooting. He was born in 1838. He was managing director of the Spanish Lead Company.

A Statue of the late Dr. D. M. Stuart has been unveiled in Dunedin, New Zealand, where he resided for about forty years. It was designed by Mr. W. L. Morrison, of Wellington, and is the first statue executed in the colony.

The Fourth Edition of Dr. Corfield's "Dwelling-houses: Their Sanitary Construction and Arrangements," has been published by Mr. Lewis.

The Congress of the Royal Institute of Public Health was opened in Dublin yesterday, the 18th inst., under the presidency of Sir Charles Cameron, M.D. The exhibition will remain open until the 27th inst.

Blocks of Creosoted Yellow Deal are being used in the repaving of the Strand, which is now in progress. The blocks removed have sustained traffic for about five years.

Mr. W. G. Dewick, a sculptor, has died in Retford in his seventy-first year. He was employed on the Albert Memorial as an assistant and at the South Kensington Museum.

It is Proposed to erect new assembly-rooms, with market underneath, at Taunton, and, as the result of a competition, Mr. C. H. Samson, architect, of that town, has been awarded the first prize of 100*l.*

A Bronze Statue of Admiral Blake is to be erected on the Cornhill, Bridgwater, his native town. It is said that only two portraits of the Admiral are in existence, and that the dissimilarity is very great.

Mr. A. Carnegie has offered 10,000*l.* for the erection of a public library in Dumfries. Mr. and Miss M'Kie have presented a site for the building.

Mr. H. W. B. Davis, R.A., announced on Wednesday that the Liverpool autumnal exhibition would be of exceptional merit, and one point was the varied character of the works apart from their high standard of quality. There was hardly a phase or a mood of art that was not represented by works of very high excellence. It was the very variety of art that lent freshness to the interest they took in art. For the very fine collection of water-colours they were largely indebted to local artists.

Mr. J. Sinnott, architect, of Liverpool, while bathing at Eastbourne with his brother and partner was suddenly drowned a few days ago.

Mr. W. G. S. Harrison, who up till quite recently had acted for many years as town clerk and clerk of the peace for the borough of Folkestone, died on Wednesday at an advanced age.

An Excursion Meeting of the Northern Architectural Association will be held to-morrow (August 20), when the Dunston Flour Mills will be visited.

Lady Dilke has suggested that the fine bronze plaques found in a house at Kew may have formed part of the series of thirty-six ordered for the decoration of the four groups of columns which originally stood (or were designed to stand, for it is not certain if the scheme was fully carried out) at the four corners of the Place des Victoires in Paris. They were an accompaniment to the bronze statue of Louis XIV. erected in the centre of the Place at the cost of the Duc de la Feuillade, and which was destroyed during the revolution in 1795.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

DESIGN FOR PROPOSED JUBILEE CLOCK TOWER, LEWISHAM.

APARTMENT HOUSE IN THE CHAMPS-ELYSEES, PARIS.

BUILDING AND BUILDERS.

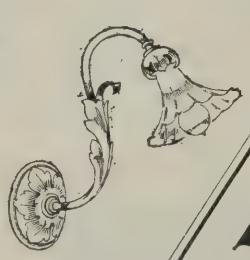
THE foundation-stone was laid on the 11th inst. of a new Wesleyan chapel at Overstrand.

A NEW memorial Free church of Gothic design is to be erected in Castleford, at a cost of 2,500*l.*

THE foundation-stones of a new Wesleyan church were laid at Scunthorpe on the 10th inst. The estimated cost of the land and building is 6,293*l.*

THE Great Eastern Railway Company are about to erect a new station, at a cost of nearly 50,000*l.*, to meet the increasing traffic of the popular seaside resort, Clacton-on-Sea.

THE Rev. A. G. Humfrey, the rector of Thorpe Mandeville, is making strenuous efforts to raise a sum sufficient to pay for the restoration of the church tower, which, he says, is in a very dilapidated and dangerous state, and needs immediate repair. The amount required is estimated at 300*l.*



TENDERS have been accepted and the erection will be at once proceeded with, of a block of almshouses at Aberdeen. The buildings are being provided by the trustees in the carrying out of the wishes of the deceased Earl of Moray, and will provide ten houses for deserving persons who formerly had some connection with the Donibristle estate.

PLANS have been passed for the erection at Woodside, Hamilton, at a cost of about 8,000*l.*, of an elementary school to accommodate 824 children. The designs, which are by Mr. Gavin Paterson, architect, show a structure of Grecian design, two storeys high. It is to be equipped in accordance with the most modern educational ideas, including a large central hall.

LIBERAL TERMS
TO THE TRADE.

About four months ago the journeymen plumbers of Montrose struck work on their employers refusing to increase the wages from 7*d.* to 7½*d.* per hour. The men ultimately resumed work on the understanding that a conference to arrange matters should be held within a certain period. At the expiry of that time the conference was held, but it was resultless. However, owing to the action of one employer all the journeymen have had their rate of wages increased to 7¼*d.* per hour.

In connection with the raising of 100,000*l.* for Congregational church extension in centres of large population, the special committee of the Congregational Union has made among first grants 1,000*l.* to the Sheffield Congregational Association, being 500*l.* for a church at Hunter's Bar, and 500*l.* for another church at Crookes, near Sheffield, and 500*l.* each for the erection of churches at West Hartlepool and Gateshead, on conditions determined by the County Union.

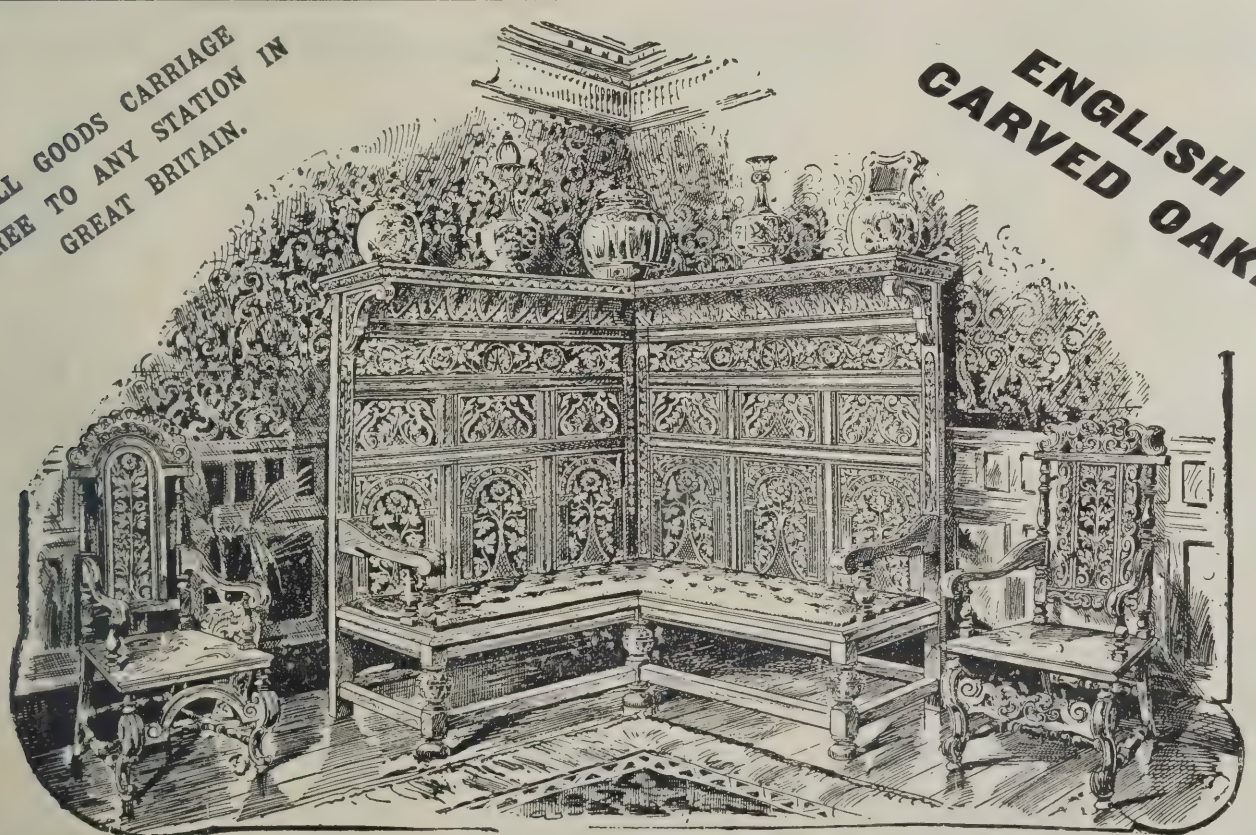
The foundation-stone was laid on the 14th inst. of a new Roman Catholic church at St. Margaret's, Finglas. The building, of which Mr. G. L. O'Connor is the architect, will be Early English Gothic in character. The nave is to be 80 feet long by 32 feet wide, with chancel, sacristies, &c., and will be capable of accommodating 400 persons. The walls will be built of limestone masonry, lined throughout with brick strengthened by buttresses ; the roof of open timber, constructed with curved ribs, moulded principals, &c. ; a handsome porch will shelter the principal entrance at the west side of the church and a neat cut stone base and ornamental railings encircle the grounds.

The strike of operative masons at Lancaster has been settled. The masters are members of the Lancashire and Cheshire Building Trades Federation, and they agreed to abide by the terms upon which the dispute in Manchester and other towns was settled. This meant an advance to 9½*d.* per hour in March next, but the Lancaster men demanded an immediate advance, and refused to commence work. The Federation called upon the operatives' executive in London to adhere to the settlement. The latter promptly ordered the strike to terminate, intimating that if they did not stop the strike pay would cease. This caused the men to agree to the terms, which were accepted by the masters.

The foundation-stone of the Jenny Lind infirmary at Norwich has been laid, and the work of erection is now in active progress. The building will be of brick, relieved with stone dressings, in Free Renaissance style. It will contain the nurses' sitting-rooms and bedrooms on the upper floors. In the rear will be the domestic offices, and on either side will be a wing to be used as a patients' ward. The kitchens and offices are so placed as to be within easy reach of all departments. The wards will be placed on arches so as to admit of a free circulation of air beneath the floors, and the nurses' living rooms will be quite apart from the hospital proper. The cost of erection and furnishing is estimated at 12,000*l.* Messrs. Boardman & Son are the architects, and Mr. T. H. Yelf the contractor.

A church and manse are in course of erection at Howth for the Howth and Malahide Presbyterian congregation. They are being built from the designs of Mr. Arthur Young, of Westminster, selected in the architectural competition held last summer, and when completed will seat about 350. It consists of a nave and transepts with a western tower, and with a vestry and sessions-room attached. The style of the buildings is Gothic of the Perpendicular period, and the group of the church, with its low embattled tower, and the gabled manse, with picturesque tiled roofs and half-timbered porches, will be a pleasant addition to the landscape, with the majestic Hill of Howth forming the background.

The contract for the construction of a sewerage system at Farsley, Yorks, and for the construction of outfall works at Rodley, for the Farsley Urban District Council, has been let to Mr. Wm. Brigg, Shipley Fields, Frizinghall. The amount of the contract is about 12,000*l.* The works are to be completed by the end of September, 1899. A commencement has already been made with the work at Bagley.



ELECTRIC NOTES.

Arrangements have been made for the placing of a number of powerful electric arc lamps in the forecourt and stable yard at Marlborough House, which are at present very indifferently lighted.

The tramways committee of the Liverpool Corporation have adopted a resolution that the Council be recommended to authorise the tramways committee to take steps to have plans, sections and estimates prepared to continue the overhead electric traction tramways from the termination of the experimental line at the Dingle to the end of Aigburth Road, and also for an extension of the experimental line from the Prince's

VARIETIES.

THE schools which have been erected by the Burnham-on-Crouch School Board were formally opened on the 12th inst.

THE ancient walls surrounding the borough of Conway have been reopened after restoration.

A ROMAN CATHOLIC church which has been erected at a cost of 9,000*l.* was opened at Eccles on the 15th inst.

A CHARTER of incorporation has been received by the governing body of Hove, which has between thirty and forty thousand inhabitants.

THE chancel of Holy Trinity Church at Wakefield has been laid with mosaic pavement as a memorial to the late Rev. Canon Madden, for thirty-eight years vicar of the parish.

THE Duke and Duchess of Westminster on Saturday drove from Eaton Hall to Halkyn, Flintshire, where the Duchess opened a public hall and library erected by the Parish Council at a cost of about 900*l.*

THE recently completed and decorated chancel of St. Mary's Mission church, St. Helens, Lancashire, was used for the first time on Sunday last.

A WINDOW in memory of Principal Caird is to be placed in the Bute Hall, as a distinctive memorial by those who have been, or are, students of the University of Glasgow. The cost of the undertaking is estimated at about 1,000*l.*

PRINCESS HENRY OF BATTENBERG, at Carisbrooke Castle, on the 11th inst., opened a museum established as a memorial in the Isle of Wight of the late Prince Henry of Battenberg, Governor of the island.

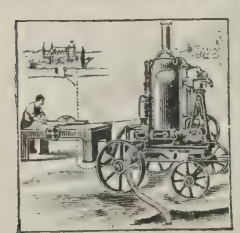
THE formal dedication of the tower which has been erected on the parish church of Thornaby, Yorkshire, was performed on the 11th inst. The church was built in 1858, at a cost of 3,000*l.*, but owing to lack of funds the tower remained unbuilt until now.

THE War Department has decided to demolish Landguard Fort at Harwich. The fort is, however, to be reconstructed and improved, so that it will accommodate three batteries instead of one, as at present.

THE Wiggenhall St. Mary (Norfolk) Parish Council has publicly invited metropolitan financiers to tender for a loan of 400*l.* for a new cemetery, to be repaid in forty years. This is said to be the first loan ever publicly offered by any parish council.

THE Mersey Docks and Harbour Board have sanctioned schemes for improvements at the Huskisson, Coburg and Brunswick Docks, at an aggregate cost of 200,000*l.* It was also decided to increase the passenger shelter and waiting-room accommodation on the landing-stage at an expense of 7,500*l.*

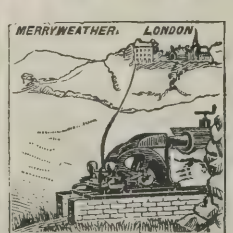
SOME workmen employed by Messrs. Price & Wills, contractors, while engaged in excavating the foundations for the walls of the new graving dock at Barry, came across a human skull and arm-bone embedded in the earth. The remains were at the edge of the cutting, and it is expected that when excavations are proceeded with other bones of the same skeleton may be found. Several antelope horns have also been unearthed near the same spot.



THE new South-Eastern Hotel, Deal, which has been erected for the South-Eastern Railway Company, has just been formally opened. The hotel is situated on the sea-front next to Deal Castle, from which it is only a few yards distant, and commands a fine view over sea and Downs. The hotel is a conspicuous object on the sea-front. It has been built in accordance with modern ideas, and is handsomely appointed; there are lifts to all floors, and the lighting is by electricity from a private installation.

ONE of the remaining old houses in Fleet Street, situate opposite Chancery Lane, which is said to have been formerly the palace of Cardinal Wolsey, has had to be shored up in consequence of losing the support of Gosling's Bank next door, that old building having recently been pulled down. The other side of the house, abutting on Inner Temple Lane, has also been affected, and has had to be strengthened by supports.

THE Bishop of Wakefield has received from Sir Robert Tempest, Bart., a further donation of 1,000*l.* towards the Bishop How memorial scheme for enlarging Wakefield Cathedral. Further meetings are to be held in the diocese in the coming autumn, and it is hoped that the first 10,000*l.* needed in order to commence actual work will shortly be secured.



ON Tuesday morning a portion of a block of buildings in Ellesmere Street, Manchester, collapsed, the roof and the two floors beneath crashing to the ground simultaneously. The

part of the building where this happened has a frontage of about 45 feet, and extends about 25 feet backward, and it is used by Mr. R. B. Wood as a weaving mill. The accident is assumed to have been caused in some way through the removal of a large boiler in the basement. There were about 100 persons employed in the rooms, but they received warning to clear out of the building, as it was noticed by those who were attending to the taking out of the boiler that everything was not so secure as it might have been. The warning was given not a moment too soon, as the last of the employés were scarcely in the street when the roof and the floors beneath fell.

A NUMBER of members of the Chester Town Council, waterworks shareholders, corporation officials and a few citizens accepted the invitation of the directors of the waterworks company to visit the works in Boughton on the 11th inst. on the occasion of the opening of a new filtering reservoir. The new filtering bed is near the entrance to the works, and is the sixth the company has constructed. The company's object is, of course, to extend the filtration operations and storage capacity of the works, and it is estimated that the new bed will enable them to cease pumping for a period of forty-eight hours without exhausting their stored supply. The cessation could last twenty-four hours under previously existing circumstances, but the new arrangement will afford double security against the risks of taking water from the river during times of flood, or tidal washes from below. The new bed covers an area of 2,000 square yards, with a capacity of storing three-quarters of a million gallons of water. It will filter 18,000 gallons per hour, and there is a special arrangement whereby the water is transferred from a neighbouring reservoir without the possibility of contamination from animal or vegetable matter. The water after being allowed to stand eight hours in this bed is let off into the clear water reservoir, and then it is raised by the engines into the covered reservoir ready for distribution.

IT is expected that the new Custom House which is now being erected in Cardiff will be ready for opening about the end of September. The building, the contractors for which are Messrs. W. Thomas & Co., of Cardiff, was designed by Mr. Tanner, architect to Her Majesty's Board of Works, London. It is a mixed style of Classic architecture and three storeys high, the front which faces Bute Street being in Portland stone, effectively relieved with carvings by Mr. Clarke, of Llandaff, while the side and rear are in white brick, partly relieved with Portland stone dressings. The entrance is from Bute Street, by means of a forecourt at the side nearest the Pier Head. On the ground floor in front is situated the office of the chief preventive officer and surveyor, having immediately behind it the bookroom. At the rear of the premises on the same floor, and reached by a corridor leading from the entrance-hall, are the Queen's warehouse and watchers'-room, while a spacious yard at the rear of the premises opens on to the West Dock. The first floor is devoted, in front, to the testing-room, which overlooks the street, and to the store-room immediately behind, and at the rear to the collector's office and long-room. The latter, which is the principal apartment in the building and where the public transact their business, is a spacious and lofty room, having a length of 37 feet and being 27 feet wide, and is entered from the first floor landing through a pair of large swing doors. The top storey has been set apart for the caretaker and domestic offices, while in the basement are located the heating chamber, wood and coal stores, &c. The whole of the sanitary arrangements are excellent, including especially the ventilation of the long-room, which is by means of a patent air extractor. The offices on the ground and first floors are laid with wood-block flooring, supplied and fixed by the Government, and on the ground floor the entrance hall and corridors are laid with York paving.

THE Stephenson Memorial Hall, Chesterfield, having undergone reconstruction whereby its accommodation is very greatly increased, was reopened on Monday last. Many improvements have been made. On acquired ground at the end of the hall a commodious stage has been erected than which there are very few larger in the provinces. Underneath the stage is large storage for scenery, chairs, &c. The flies, bridge and grid are on the latest and most improved principle. The proscenium opening has been made as large as possible so that the stage may be used by a large choir, as well as for theatrical performances. A fireproof curtain by Merryweather divides the stage from the auditorium and can be raised or lowered in a few seconds. Six new dressing-rooms have been built alongside the stage, and are fitted with all necessary lavatory accommodation. The two old retiring rooms on the Back Lane side have been made suitable for the altered portion of the stage. The public hall has now a floor space of 68 feet by 46 feet 6 inches. The gallery, which runs along two sides and the back of the hall, has not been altered. The heating, ventilation and lighting of the hall have been revised, and the walls, ceilings and gallery have been cleaned and re-decorated. The auditorium and stage have been fitted up with hydrants and

fire-extinguishing appliances. A water service main has been connected to the main in Corporation Street for this purpose alone, and a flow of water can be turned on at any time. The entrances to the hall have been entirely rearranged. The front entrance way has been retained, and there are three entrances to the hall and gallery on the Corporation Street side. In Station Back Lane are exit doors to the hall and gallery.

The Cookridge Street Baths sub-committee of the Leeds City Council had on Wednesday under consideration the alterations which it is proposed to carry out at the Cookridge Street Baths, recently acquired by the Corporation, and which it is expected will cost about 5,000*l.* At the present time ladies' days are set apart at the other Corporation baths, but in consequence of the large number of persons who wish to make use of the baths this has been found to be a very inconvenient arrangement, and the committee intend to make the gentlemen's first-class bath at Cookridge Street Baths shallower and to turn it into a ladies' bath. This will enable them to do away with ladies' days at the other baths. The large swimming bath at Cookridge Street, which has not been used for some time, will be altered and made into a first-class gentlemen's swimming bath. Its length will be shortened to 75 feet, which will make it a multiple for racing purposes, and at one end a gallery will be erected. With regard to the Turkish Baths it is intended to introduce all the latest improvements, and with the object of inspecting recently erected baths, Harrogate and Openshaw (Manchester) will be visited. The committee also considered the regulations which have been in force for the first-class Turkish baths. Ten tickets could be purchased for 1*l.* and sixty for 5*l.*, but the committee now decided that 2*s.* 6*d.* should be charged for one ticket, 10*s.* 6*d.* for six tickets and 1*l.* for twelve tickets. Mr. Green Hirst (the chairman) presided.

The adjourned public meeting to consider the question of pulling down the block of buildings in the Market Place, Richmond, Yorks, known as the Toll Booth, and the erection of a new Town Hall and Municipal Buildings on the site—between the present Town Hall and the Market Cross—was held on Tuesday evening. The Mayor (Councillor Sidney Robinson) presided, and gave a comparison of the two sites, and pointed out that they would not be able to raise a new Town Hall higher than the present Toll Booth, for they would then be shutting out the light of Lord Zetland's The Golden Lion and other property, whilst they would be losing a rental of 142*l.* per annum. As to the present character of the Toll Booth property, he found the outer walls generally very good, and the cost of putting it into a sanitary state would be about 120*l.* They had room to extend the present Town Hall if they desired. He consistently opposed the scheme, and in their present state the question ought not to have come before them at all. The Town Clerk having explained the details, Mr. Simon Coates objected to the scheme as injudicious. They could not sacrifice a rental of 142*l.* per annum to satisfy the whim of two or three young Councillors. Mr. Coates moved a resolution in opposition to the scheme, and suggested that as the manufacturing element had gone a public park might be obtained, and Richmond improved as a residential place. Councillor W. Brittain seconded Mr. Coates's motion, which was carried by a large majority.

TRADE NOTES.

The new fever hospital, Wallington, Surrey, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues (some single and some double fronted), and patent Manchester grates.

In our note on the new Adam blind which appeared in our last week's issue we inadvertently spoke of it as a venetian blind, whereas it is intended to supersede both venetian and stuff blinds. It is made of laths woven in a loom, is remarkably light, is made in all colours, and, as we pointed out, it can be painted or stained and varnished.

The Simplex Steel Conduit Company, Limited, Coventry Street, Birmingham, have opened a London office and warehouse at Mansion House Chambers, 20 Bucklersbury, E.C., where they intend keeping a stock of their conduit and accessories. They have appointed Mr. E. Sheppard, late electrical engineer to the Peninsular and Oriental Steam Navigation Company at the Royal Albert Docks, as their London representative. Owing to the very large demand experienced for their steel conduit system, they are more than doubling their present plant throughout.

SEA ENCROACHMENT AT DEAL.

The Corporation of Deal have had under consideration a serious danger which menaces the town from the sea encroachment, and have decided to proceed at once with important new works of sea defence near Sandown Castle at the north end of Deal. Telegraphic instructions have been given to a London engineer. The surveyor to the Corporation stated that unless

these works of defence were undertaken at once the encroachment of the sea would undermine the existing wall and cause it to collapse. The urgency of the matter was also emphasised by the town clerk, who said he had visited the spot, and the state of things had so alarmed him that he had written to the Board of Trade pointing out that the whole of Deal was likely to be submerged if the wall went. The sea wall was much damaged by the heavy gales of several months ago, which carried away the shingle to such a depth as to leave the foundations exposed.

PIERCING OF THE SIMPLON TUNNEL.

A CONVENTION between the Jura-Simplon Railway Company and the Italian Government for the piercing of a tunnel through the Simplon was signed in 1896. Under its terms the former undertook to carry out the work on condition that the latter engaged itself to construct the line of access on the Italian side, to pay the company an annual subsidy of 66,000 fr. (2,640*l.*), and to obtain from the Italian provinces and towns most interested in the undertaking a contribution of 4,000,000 fr. (160,000*l.*) towards the cost of making the tunnel.

The corresponding contributions from the Swiss Government, cantons and towns was fixed at 15,000,000 fr. (600,000*l.*), and this sum has already been amply subscribed.

Of the 160,000*l.* to be contributed by the Italian provinces, Milan, Genoa and Navara have raised between them 98,000*l.*, which seemed to be the extreme limit to which they were prepared to go, but as the Government has just declared that if the provinces will make another effort it will give what is ultimately wanting, there is no doubt that the conditions stipulated by the convention will be fulfilled, and that the scheme will be carried out.

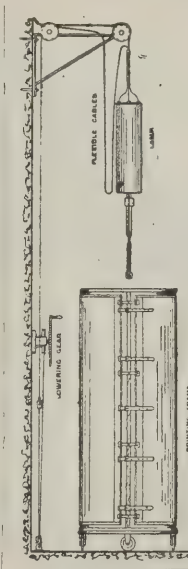
The Jura-Simplon Company has already made a contract with a syndicate for the execution of the work at a cost of 2,180,000*l.* if the line be a single one, and 2,780,000*l.* if it be double. The time allowed to the contractors for the completion of the work is five and a half years from the date of its commencement.

The new tunnel will be the longest yet made, its length being 19,731 metres (12 miles 463 yards), of which rather more than half will be on Italian soil. The greatest altitude obtained will be 705 metres (2,310 feet) above the level of the sea, as compared with 1,295 metres in the Mont Cenis and 1,154 metres in the St. Gothard tunnels. The steepest gradients in the lines of access will be 10 in 1,000 on the north and 25 in 1,000 on the south side. The Swiss entrance to the tunnel will be at Brieg, and the Italian entrance at Isella. The distance from Domodossola, to which place a railway already runs, to Isella is only about 10 miles.

The new line will open out direct communication between North Italy and the cantons of Vallais, Vaud, Geneva, Fribourg, Neuchatel and Berne, besides shortening the distance between Milan and Paris by 109 kiloms. as compared with the Mont Cenis, and by 53 kiloms. as compared with the St. Gothard routes.

In addition to the actual saving in distance there will be a further saving in time, for the lower altitude to be obtained will allow of a higher rate of speed being maintained and the cost of traction will, for the same reason, be less.

The plan is to make concurrently two parallel tunnels, each for a single line, only one of which will be opened for traffic at first. At the central point of the tunnel, which is to be first completed, there will be a double line for the length of 400 metres (437 yards), in order to allow of trains passing each other.



When the yearly traffic returns shall exceed the rate of 40,000 fr. per kilom. (992*l.* per mile), the Jura-Simplon Railway Company engages to complete and open for traffic the second tunnel. The concession to the railway company is for a term of ninety-nine years.

The eventuality of the purchase of the Swiss railway companies by the State is provided for in the convention, the validity of which has already been recognised by the Confederation.

The subvention of 15,000,000 fr. from Switzerland and 4,000,000 fr. from Italy will not be given as heretofore in similar undertakings "à fond perdu" or absolutely, but will take the form of deferred shares in the Jura-Simplon Railway Company, and there is reason to believe that before many years have elapsed those shares will begin to yield a dividend. In the meantime the possession of the shares by Italy will give her the right to four places on the board of directors of the Jura-Simplon Railway Company.

The advantages which the opening of this new line of international communication will confer on Milan are obvious, and the diversion of a considerable amount of import and export traffic, which now goes through Marseilles, will very materially benefit the port of Genoa. The work of piercing the tunnel will be begun in the course of this year.

ABATTOIRS FOR LONDON.

The public health committee of the London County Council have issued a report in which they deal with the desirability of the establishment of public slaughterhouses throughout London. In dealing with the subject the medical officer shows the inadequacy of the inspection of meat consumed in London, and further points out that to insure the proper inspection of carcases it is absolutely necessary that all animals should be killed in public abattoirs. The greater number of animals are slaughtered in private establishments, and consequently escape the necessary inspection.

The health committee propose to submit their opinions to the Local Government Board, together with an intimation that the Council are prepared to accept such responsibilities as may be necessary to give effect in London to the recommendation of the Royal Commission on Tuberculosis, and to ask the Local Government Board whether they will include in any legislation introduced by them in connection with the Commission's report the provisions that will be necessary for that purpose.

ENGINEERS' STRIKE.

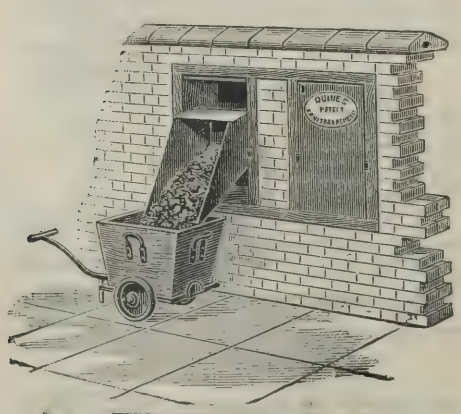
The executive of the Amalgamated Society of Engineers have issued a report bearing upon the engineering trade lock-out and strike of last year.

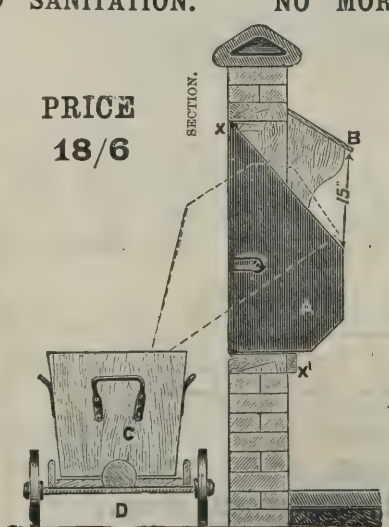
On July 3 the men ceased work in three London firms, and on July 13 the lock-out was generally enforced throughout the country, 16,944 members of the Society being affected. A notable feature of the dispute, continues the report, has been the manifestation of the international interests of labour, the Continental and Colonial workmen contributing a sum of 28,399*l.* 7*s.* 5*d.* Of this sum over one-half came from Germany. The men returned to work on January 31, and thus was brought to a close a struggle lasting over thirty weeks, involving at the end 27,996 of the 91,944 members of the Amalgamated Society.

The funds of the Society at the end of June 1897 contained a balance of 361,140*l.* At the end of the March quarter, eight weeks after the close of the dispute, the balance was 134,000*l.*, after deducting all loans. The cost to the workers, concludes the report, may be partly computed, but the damage inflicted on the employers can never be known. One authority has calculated the loss to the employers as twenty-five millions, but, whatever the amount, it is certain to be sufficient to make even a national combination of employers hesitate before engaging lightly in a trial of strength with trades unionism.

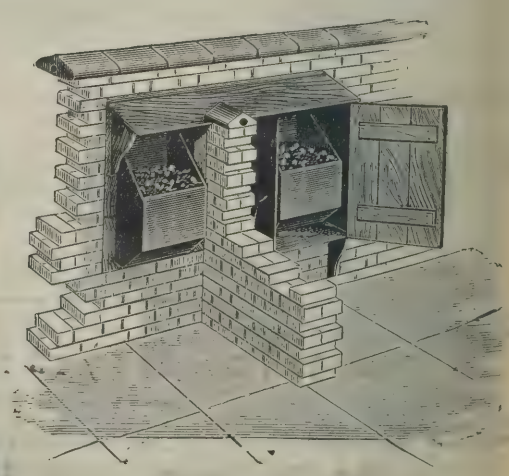
LIVERPOOL DOCK IMPROVEMENTS.

At the weekly meeting of the Mersey Docks and Harbour Board on the 11th inst., the recommendations of the committee of works which were brought forward at the previous meeting were again submitted as follows:—(*a*) To extend in an eastwardly direction the double storey sheds ordered to be erected at the western ends of the north and south quays of the Huskisson Branch Dock No. 2, the estimated cost of the extension on the north quay being 38,000*l.*, and of that on the south quay 37,000*l.* (*b*) To carry out certain alterations at the north quay of the Coburg Dock, and to erect a shed on that quay at an estimated cost of 43,000*l.* (*c*) To alter the passage between the Brunswick and Coburg Docks to 100 feet in width, the Parliamentary estimate for which work is 82,324*l.*





On the last occasion, says the *Liverpool Courier*, it was explained that these recommendations formed part of the scheme which had been frequently discussed by the Board.



Mr. Hughes moved and Mr. Barrow seconded the confirmation of the recommendation.

Mr. Chadwick, with regard to the recommendation relating to the quay on the north side of the Huskisson Branch Dock No. 2, said he was very much afraid that the works committee were making a serious mistake in encroaching upon the roadway, as they proposed to do, to the extent of about 15 feet, seeing the very heavy traffic at present there and the large increase expected on the completion of the double storey sheds. That morning he noticed a block in the traffic at this particular place. It was quite true that the roadway was encroached upon to a considerable extent by overflow cargo from the White Star berth; on the other hand, there were that morning only three steamers in the whole of that district, whereas when the whole of the buildings were completed, and they had the work in full swing, they would have three times three steamers there, yet they were proposing to make the access narrower. He was strongly convinced that the proposed width of the erection on the north side should be reduced by at least 5 feet.

Mr. H. R. Robertson remarked that the matter had been under the consideration of the traffic committee, who had sent in a communication to the works committee recommending

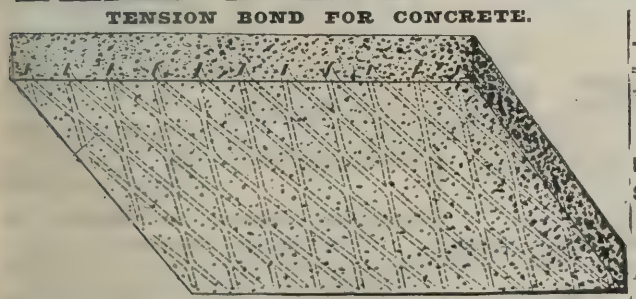
them to reduce the width from 95 to 90 feet, so as to give more room in the roadway. The water was being deepened in the Huskisson Dock, and larger ships would naturally go to those berths, therefore it was necessary that they should be able to properly handle the cargo from those vessels.

Mr. Hughes, chairman of the committee, promised that the observations of Mr. Chadwick and the recommendations of the traffic committee should have careful consideration. He had recently made a survey himself, and did not agree with what had been said. The roadway when the shed had been erected would remain 65 feet wide, which would be more than ample if it were used for its legitimate purpose. Regent Road, which took traffic as great, if not five times greater than the traffic here, varied in width from 24 to 40 feet. He personally was of opinion that the 5 feet space would be more valuable in the shed than in the roadway. Still, on behalf of the works committee, he promised that the question should be fully considered.

With this understanding the recommendations were confirmed.

The proceedings of the marine committee included the following recommendation :—To construct an additional shelter shed, with a waiting-room, on the Prince's landing-stage, and to cover over No. 6 bridge and a portion of the Prince's Parade opposite thereto at a total estimated cost of 7,500*l.*

Mr. G. B. Crow, in moving the acceptance of the recommendation, mentioned that the committee had had a good many complaints from people who had to use the north end of the landing-stage as to the great need of shelter accommodation there, especially in bad weather. Passengers embarking or disembarking now had the disadvantage and discomfort of having to wait in the open in all weathers. The matter had received the attention of the committee for a considerable time, but it had been accentuated by the increased number of ships that went alongside the landing-stage at the north end. That day there were three steamers to embark passengers, two of the vessels being bound for Canada and one for the United States. Of course two only could be accommodated at one time. It was a common thing to have two vessels there on Wednesdays, Thursdays and Saturdays, and it was therefore very desirable that, in order to make the port as popular as possible, they should provide passengers with every accommodation it was within their power to give them. He was sure that this proposed improvement would have the tendency to make the port more popular than some people supposed Southampton to be. However, of that they had no fear. At the same time, he thought they should, as far as they possibly could, remove every cause of complaint. They were making an extension of something like 600 feet, and the erection would have a flat roof, so that at any future time should it be found desirable to have communications across the top of the stage from the pier, as had been several times suggested, this could be done by putting an extra bridge there.



Mr. R. Gladstone seconded the motion, which was agreed to. The recommendation will be brought forward for confirmation at the next meeting, the standing orders requiring postponement of its consideration for a week.

IMPROVEMENT IN BUCHANAN STREET, GLASGOW.

It is understood that a critical stage has been reached in the negotiations between the Glasgow Corporation and Messrs. Stewart & M'Donald with reference to the proposed widening of Buchanan Street. In consequence of the action of the statute labour committee, which resulted in the Dean of Guild Court postponing last week consideration of Messrs. Stewart & M'Donald's application for a lining, the firm are showing a disposition to close the negotiations, if, indeed, they have not already done so. In connection with this dispute, our London correspondent, says the *Glasgow Herald*, has been making some inquiries with regard to the prices paid by public bodies in the Metropolis for land for improvements. After careful investigation he has obtained the following information, which may be relied upon as authentic :—"The price paid for land for improvements depends upon locality and position. For example, in Bermondsey back land costs from 1*d.* to 3*d.* per foot super ; front land 6*d.* to 1*s.* per foot. In the Strand 10*l.* per foot has been paid for front land. In the City the Commissioners of Sewers—in effect the Corporation of London—have paid from 10*l.* to 30*l.* per foot, according to locality. To cite a concrete case, in connection with the widening of a part of Fleet Street from New Bridge Street to Bride Lane, about 813 feet super was thrown into the street at a cost of 28,742*l.* Another recent instance is that of seven houses in Finsbury Pavement, covering a superficial area of 15,700 feet, which were sold by the Corporation ; they realised a ground rent of 7,100*l.* on a building lease for eighty years, being at the annual rental, roundly, of 9*s.* per square foot, the whole property—land and everything standing upon it—to revert to the Corporation at the expiration of the lease of eighty years."

THE VAUXHALL TEMPORARY BRIDGE.

The engineer's department of the London County Council decided to open the temporary bridge which has been erected across the Thames between Vauxhall and Pimlico yesterday. It has been constructed to last ten years, for the first five of which it will take the place of the old Vauxhall Bridge, which is to be knocked down and rebuilt, and during the remaining period it will be used for the traffic which will be diverted while Lambeth Bridge is being reconstructed. It is not proposed to close Vauxhall Bridge until next week, the officials of the London County Council being desirous of watching the working of the temporary bridge for at least a week in order to be certain that it will be capable of taking the traffic of the old bridge. Providing no hitch occurs Vauxhall Bridge will be closed on the 26th inst., and a fortnight later its demolition will be commenced. The new bridge crosses the Thames immediately in front of the Tate Gallery.

WELSH WATERING PLACES.

Sanitary affairs, especially in regard to water supply and drainage, are well attended to in the chief health resorts on the Welsh coast—for instance, at Rhyl, Llandudno, Aberystwyth, Barmouth and other places ; but there are other parts of North Wales in which there is evidently much to be desired in these respects. According to a report issued by the Local Government Board, the district in question includes much of the finest scenery in the principality. All readers who have travelled in Wales know the beauty of Trefew and Bettws-y-Coed, and the grandeur of Capel Curig, with its magnificent view of Moel Siabod in one direction and of the peaks of Snowdon in another. The Local Government Board's special inspector, Dr. Wheaton, gives a very bad account of this charming and most popular district. Owing to repeated outbreaks of infectious disease during the last two years, Dr. Wheaton was instructed to make a thorough inquiry. His report is that, with the exception of a number of old and ill-ventilated cottages, the dwellings are usually well built and clean, but that the water supply is defective in quantity and bad in quality, and that the drainage and seemingly the provision for the removal of dangerous refuse are practically non-existent. The water supply, for example, is derived mainly from the rivers Llugwy, Lledr and Machno, which are liable to pollution, instead of from the lakes abounding in the hills, and which are entirely free from pollution. At Bettws, where the supply is taken from the Llugwy, above the Swallow Falls, the quantity is inadequate to summer requirements, when tourists are most numerous and when all the available rooms are taken by visitors. So seriously deficient is the supply that the "district council have decided to supply a number of houses near which the water-main passes on its way to the village." Then, as to sewerage, "there is a whole district known as Pentrefelin unconnected with the public sewers, the sewage from the dwellings being either discharged into the Llugwy or allowed to escape into the ground through leaking rubble-drains." At Capel Curig there is a system of sewerage, and the water is obtained from springs and courses flowing down the mountains or from the Llugwy. The village of Cwm-Penmachno is cited by the inspector as "an illustration of the complete neglect in the district of all sanitary matters." The following is the description given of it :—"The roads and paths in this village are unmade and untended ; the water supply is very unsatisfactory ; there is no system of sewerage, and the refuse from the houses is either thrown into the Machno or allowed to accumulate on the banks until a flood washes it away." No wonder that, under such conditions, there have been attacks of enteric fever and diphtheria in the district. There is, if proper care were exercised, every constituent of health and recreation —fine scenery, pure mountain air, ample space for dwellings, abundant supplies of unpolluted water obtainable from the lakes, and yet, owing to neglect by the local authority, some of the worst and most dangerous diseases lie in wait for unwary visitors. It is not for want of warning that this neglect has occurred, for the inspector declares that "Dr. Peter Fraser, the local medical officer of health, has frequently drawn the attention of the district council to the urgent sanitary needs of the district; but hitherto his recommendations have not been carried out; and, in short, the action taken by the district council for the sanitary improvement has been almost nil." That is a deplorable record. Perhaps now that it is published by such an able authority those who are responsible for the health of the locality will bestir themselves to remedy these crying defects. Otherwise Bettws and Capel Curig and the other places referred to will suffer great diminution of their prosperity, for visitors are very keen to note dangers to health in places of summer resort.

THE IRON AND STEEL INSTITUTE.

On Friday last, says a special correspondent of the *Leeds Mercury*, a small party of the members of the Institute left Stockholm to make a fortnight's tour in the Arctic circle mining district, under the guidance of Mr. R. G. Graves, representing the secretary, Mr. Bennett Brough, who stays at the capital of Sweden in order to complete the arrangements for the meeting.

Although the meeting of the Iron and Steel Institute at Stockholm will be the first assemblage of any technical or scientific body, of English origin, in Scandinavia, it is not because England has failed to recognise the great claims of Sweden to be so distinguished. Few countries have produced a larger muster of great names in science—at any rate, relatively to population—and especially the science of metallurgy. The names of Berzelius, Rinman, Ericsson, Akermann, Styffe, Eggerty and others at once occur in this connection, and in the present day Nordenfeldt and other Swedes have done much to develop the modern systems of ordnance. It was not, however, because of these considerations that the Iron and Steel Institute fixed their meeting on Scandinavian soil, but because there is much in common, and a possibility of their being much more, between Sweden and our own country.

The iron industry of Sweden is nevertheless of small concern after all as compared with that of other countries like our own and the United States. The total make of pig-iron is only about half a million tons a year, which is a sixty-sixth part of the world's production in the current year. The Swedish make of steel by the Bessemer process is about 100,000 tons a year, which is only a fortieth part of that of the United States alone, and about a twentieth part of that of Great Britain. The make of Siemens, or open-hearth steel, is rather less, but it is increasing rapidly. The mainstay of the Swedish works continues to be the manufacture of bar-iron of high quality, which, being made from the best ores and the purest of charcoal, is in large demand for many purposes of commerce. More than 150 works are engaged in this branch of industry, but most of them are of small size, and all of them put together would produce a much less quantity in a year than would a single Bessemer plant of the largest dimensions in Great Britain or the United States. In short, the watchword of the Swedish iron trade, and the secret of their large and continually growing success has been "quality, not quantity," and in this respect the trade and industry differs from those of other countries visited by the Iron and Steel Institute. But it has not been so much for the purpose of ascertaining the conditions under which the Swedish iron trade of to-day is carried on, for few phases of metallurgical industry are better known, nor even for the purpose of seeing ores, Swedish iron and steel works, for few of them are deemed to be of sufficient novelty or general importance to justify a visit, as for the purpose of learning the capabilities of Sweden in the direction of supplying other European countries with iron ores, that the present meeting is of interest. The ore deposits of Sweden are of very large extent, but they mainly lie within the Arctic Circle, and the Arctic Circle is not exactly the place that mining companies would choose for carrying on their operations, if they had any choice in the matter. In the first place, there is darkness for at least seven months of the year, except such light as is furnished by the aurora borealis or by electricity. Then, again, the climate is necessarily very rigorous, and interferes with the business of mining in more ways than one—not least so, by the stoppage of transport to the port at which the ores have to be shipped for export, a distance of about 150 miles. Nevertheless, it has apparently been established, to the satisfaction of leading members of the trade in both the United Kingdom and Germany that the business can be carried on with commercial success, and the best proof of this fact is the trebling of the exports within the last three or four years. There are three main deposits available for export—all of them within the Arctic Circle, but at considerable distances from each other, and from the port of Lulea, where they have now to be shipped. The nearest to that port, and the only deposit actually being worked at the present time, is that of Gellivara, belonging to the Gellivara Mining Company. Gellivara is a village of considerable size, having several thousand inhabitants, of whom 800 to 1,000 are already employed in the mines. The railway from Lulea to Gellivara is already built, having been constructed in 1889, but there is no railway as yet to the still larger deposits of Luossovaara and Kiirunavaara, and hence the party of members of the Iron and Steel Institute, which is now visiting those deposits between August 12 and 25, will have to drive from Gellivara for a distance of 40 miles, thence to take a boat on one of the numerous rivers in this part of the world, for a further distance of 40 miles, and finally to walk for the last stage of 10 miles—making a journey of 90 miles in all from the nearest railway station. The country is exceedingly bleak and inhospitable, vegetation being

PATENT

VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

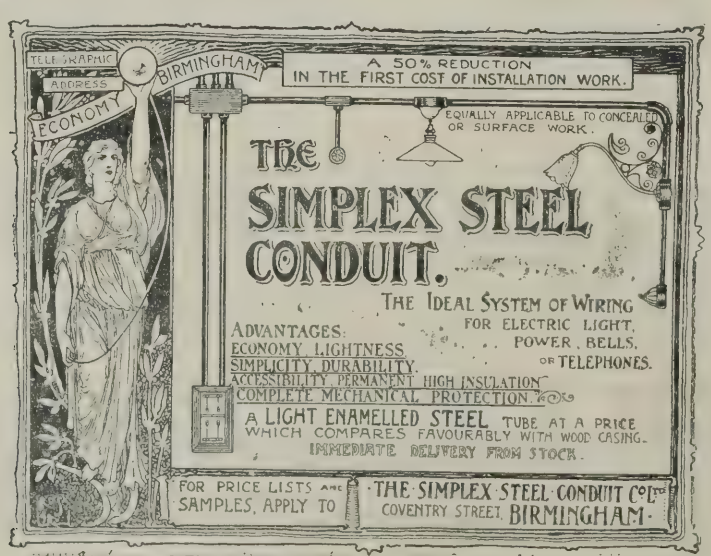
scanty and scrubby. The ore deposits at all three centres have been exhaustively studied by experts, and have been known for more than a hundred years. Indeed, only quite recently a full report on the whole subject has been presented to King Oscar by the Swedish Iron Board, in view of the proposed construction of a line to connect the Kiirunavaara mines, and possibly also the others, with the Atlantic Ocean on the other side of the country, at a point called Victoriahavn, by Ofoten. These researches have proved that the ores are of very large extent and of really wonderful richness—most of it, so far as tested, exceeding 65 per cent. of iron, although not by any means of equal purity. The deposits are largely on the surface, and are of such thickness that they can be quarried at a very small cost—perhaps more cheaply than any ore deposits in the world, unless it be those of the Mesabi ore range, in the Lake Superior region, whence the works of the Carnegie Company at Pittsburgh are chiefly supplied. It is estimated by authorities and proved by actual experience that when these ores are worked on a very large scale, as they are likely to be before long, they can be put f.o.b. on the Atlantic or the Gulf of Bothnia at not more than 5*s.* to 5*s.* 6*d.* per ton, which compares favourably with any ores mined in Europe to-day of equal value. Even the famous ores of Bilbao, on which the country has drawn to the extent of about five million tons a year for several years past, cost a good deal more than this figure relatively to their metallic value; but, on the other hand, the Arctic mines are almost as far again from British ports as those of the north of Spain. The question that appears to be exciting the largest amount of interest among iron authorities next to that of the cost at which these ores can be delivered in Great Britain and Germany, is the proportions of ores that are suited for the basic and the acid processes of steel manufacture. It is now pretty generally known that the acid process calls for ores of specific composition and purity, while the basic process allows of ores being utilised which, in a metallurgical sense, are by no means free from considerable contamination. The supply of acid ores available in Europe is by no means so large as the supplies of basic ores, and hence the value attached for many years past to the ore supplies of Northern Spain, which are almost entirely adapted for acid treatment—which, by the way, is the system preferred by engineers, railway companies, shipbuilders and others for most of their ordinary requirements. The surveys made in Swedish-Lapland have demonstrated that more than one-half of the ores determined have too much phosphorus to suit them for the acid process of steel manufacture, which would rule them out of the trade as mainly carried on in this country, including Scotland, South Wales, Cumberland and Cleveland. On the other hand, it fortunately happens that the acid system is not so generally followed in other countries as in our own, so that Germany and Belgium, and, to a less extent, Austria, would be likely to supply markets for the basic variety, and leave the acid or non-phosphoric ores for British consumption. This is the trend of events at the present time. Germany, in point of fact, has already imported large quantities of phosphoric ores from Swedish-Lapland, and will furnish an almost unlimited market for the same variety at a price which must, however, compete with the prices at which the much leaner ores of Alsace, Luxembourg and the Moselle are delivered at German furnaces. Whatever the proportions of the different qualities of these Arctic ores may be, the total supply has been declared by experts, after very thorough examination, to be practically inexhaustible. This fact alone is one of good omen for the future of the British iron trade. But there are also those who believe that the Arctic ores will, in course of time, furnish a cheaper source of supply than that on which we have hitherto been so largely dependent in the north of Spain.



THE WORKMEN'S COMPENSATION ACT.

A CORRESPONDENT of the *Times* writes:—When during the session of 1897 the Government showed a determined front on the subject of workmen's compensation, and resolved upon a scale of payments which at the time seemed to be onerous and excessive, many employers made up their minds that the paths of industry in the future were not to be strewn with roses, if, indeed, they were not to be thick set with thorns. The efforts that were made, mainly by the representatives of the coal and iron industries, to secure some modification of the Bill as originally introduced were not very successful. The main principle, at all events, was preserved. Employers were held to be responsible for all accidents to workmen in their employment, except such as could be proved to be due to the workman's own wilful neglect, and a scale of compensation was definitely fixed which left the employer face to face with liabilities which, though difficult of assessment, were generally believed to be of a serious and even ruinous character. Since the Act was passed employers in all the leading industries have been making earnest efforts to cover their liability by private arrangements with their workmen, by forming local combina-

tions among themselves, or by accepting the best terms they could secure from outside organisations; and it may be assumed that 90 per cent. at least of the large employers of labour throughout the country are now protected by one or other of these different schemes of insurance against risks which would otherwise be insupportable except by corporations of unusually large means.

Although it is now over a month since the Workmen's Compensation Act came into operation, it has not as yet produced any number of cases that have involved litigation worth speaking of, and so far as rules, precedents and covering cases are needed they have yet to be found. Only one thing appears to have been made clear—the Act is not likely to be such a source of trouble and outlay to the average employer as was at one time anticipated. Two provisions in the Act have proved to be the salvation of the employer—the one freeing him from responsibility until after the expiry of fourteen days, and the other leaving an open door to the question of the workman's fault in causing an accident. It has been found that workmen are, as a rule, anxious to provide for relief from the first hour of their incapacity for work, and are naturally anxious to cover the first fortnight during which, unless they can make some arrangement otherwise, they have to rely on themselves. They can do this in one of two ways—either by insuring themselves with one of their own friendly societies, or by arrangement with their employers. Where the latter have shown a disposition to make mutual arrangements on reasonable terms, the workmen have, in a number of cases, accepted them and agreed to contribute a certain, but of course unequal, proportion of the compensation fund. Thus, in one notable case—that of the Pearson and Knowles Iron and Engineering Works at Warrington—an existing organisation of a mutual character, which has been in operation for many years, has been effectively modified, with the approval of the Chief Registrar of Friendly Societies, so as to meet the provisions of the new Act, and a similar arrangement has been made at the large sheet-glass works of Pilkington Brothers at St. Helens. Again, the Great Eastern Railway Accident Fund, in which over 24,000 workmen are concerned, has been similarly modified to meet the new conditions, and supplies an admirable precedent to the railway world in general. So far as the coal trade is concerned the arrangements made have been very varied. In some of the leading districts the coal-owners have grouped themselves into a mutual protection and indemnity organisation pledged to find the needful funds to provide for all cases of accident as they arise. In other cases many individual collieries have effected insurance with one or other of the insurance companies which have been so vigorously working up this business for the last few months. Some of the leading firms of coalowners, especially those which are known to be specially careful and capable in the management of their affairs, have radical objections to associating themselves with their trade neighbours. Such employers object to being made responsible for the financial position of their neighbours, and they also decline to be unduly taxed for the benefit of employers who are less careful than themselves. It is probable, moreover, that in such arrangements the cost of organisation is higher than it would be in cases where the employer had everything directly under his own cognisance. In the case of insurance with an insurance company the employer has to face the likelihood of larger premiums, but not without some countervailing gains. In such a case the premium is fixed from the beginning so that there would be no danger of additional premiums being called up to provide for sudden and unforeseen losses, while it would be no small gain to feel that every claim, whatever its duration, has been at once got rid of for an annual payment, instead of remaining, in the cases of permanent disablement, a charge on the future for an indefinite number of years. Still another detail, but one of importance, is the fact that if there was a change in the partnership of a firm, from whatever cause, difficulties would be likely to arise because all the pensions running would have to be provided for by the party going out, who would then, at any rate, have to consider the capitalisation of those pensions. The premiums quoted by insurance companies have generally been a good deal more than those that individual employers look upon as required. The cases of the insurance companies and the individual employers do not, however, stand on all fours. An insurance company, in fixing its premium, has to capitalise the value of the allowance for total and partial permanent disablement upon an estimate of the years of duration, whereas the individual employer will naturally deal with such payments as they fall from year to year. Some of the leading insurance companies, admitting the possibility of quoting premiums for present assurance that may be in excess of actual requirements, have undertaken to return any such excess premium after charging the cost of the claims and of administration in addition to a profit of 10 per cent. of the premiums paid.

The arrangements which colliery owners have already made, either mutually *inter se* or by insurance with public companies,

THE CAPE ASBESTOS COMPANY, LIM. Head Offices: 8 Minories, London, E.C.

have justified the belief that a penny per ton all round will be likely to fully meet the provisions of the Act, and this sum applied to the whole coal industry of the country will work out to an annual expenditure of 840,000*l.* Now in some districts the provision already made for meeting accidents, &c., is so considerable that this burden, if merged in that already borne, will not be nearly so serious as it would otherwise have appeared to be. In South Wales, for example, the Miners' Permanent Provident Society already raises by the joint contributions of employers and employed a sum equal to a halfpenny per ton on the whole coal output, the total sum so provided in 1876 having been 77,300*l.* And so to a greater or less extent in the other coalfields of the country. The maintenance of these provident societies, to which both parties subscribe, although often in very unequal proportions, has in the majority of cases been resolved on. Indeed, it has been stated within the last few days that the largest and most important society of the whole —the central association for dealing with distress caused by mining accidents—so far from having gone to the wall, as it was last year feared it might do, has not only kept alive, but has even considerably increased its membership since the passing of the Act. This must mean that, instead of continual litigation between employers and employed, which was at one time apprehended, they will continue to have interests in common and to share one another's burdens probably under conditions which will leave the business of administration mainly in the hands of the workmen. This last qualification is of obvious importance, because the greater the mutuality in these funds the more unlikely it is that the employers will become the victims of successful malingering which has been found such a serious evil under the German law of 1885.

The iron and engineering industries have, like the coal industry, found up to the present time that they also have been more frightened than hurt. It was at one time anticipated that the Compensation Act would add about sixpence per ton to the cost of producing pig-iron, and it was grimly prophesied that this last straw, on the top of dearer minerals and foreign competition, would completely break the camel's back. Fourpence of the amount stated was expected to be added through the increased cost of coal, and the other twopence was expected to take the form of insurance premiums for the pig-iron industry itself. It now turns out that some districts have been able to effect insurance with public companies at as low a rate as one-halfpenny per ton of pig-iron produced, and that the increased charge made through coal does not exceed another three-halfpence, so that twopence per ton of pig is an outside figure, being one-third or less of the amount originally talked about. It comes, in short, to this, that the Compensation Act of 1897, like the Employers' Liability Act of 1880, has been much less harmful to our great industries than was expected. In 1880 the insurance companies demanded 3*s.* to 4*s.* per 100*l.* paid in wages as a premium in the engineering industries, and some years later the employers found that they could insure themselves and leave a handsome profit on the transaction for about a shilling. It is probable that when risks and rates have been better adjusted to one another, the burden of the Act of 1897 will be attended with equally agreeable disappointments.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

16783. John Robertson, for "An improved square for use upon mouldings and the like."

16791. Hermann Wasserman and Albert Wasserman, for "Improvements in coverings for floors or walls."

16915. Samuel Jones Payne and John James Edwards, for "Improvements in apparatus for moulding bricks or the like."

17002. Henry Harrison, for "Improvements in kilns for burning bricks and similar articles."

20414. Thomson, for "Glass tiles."

23378. Walker, for "Manufacture of roofing-tiles and apparatus therefor."

1087. Beyer & Recke, for "Kilns for baking bricks, pottery, cement and the like."

13061. Mondron, for "Process for decorating glass panels and the like for covering walls or similar surfaces."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

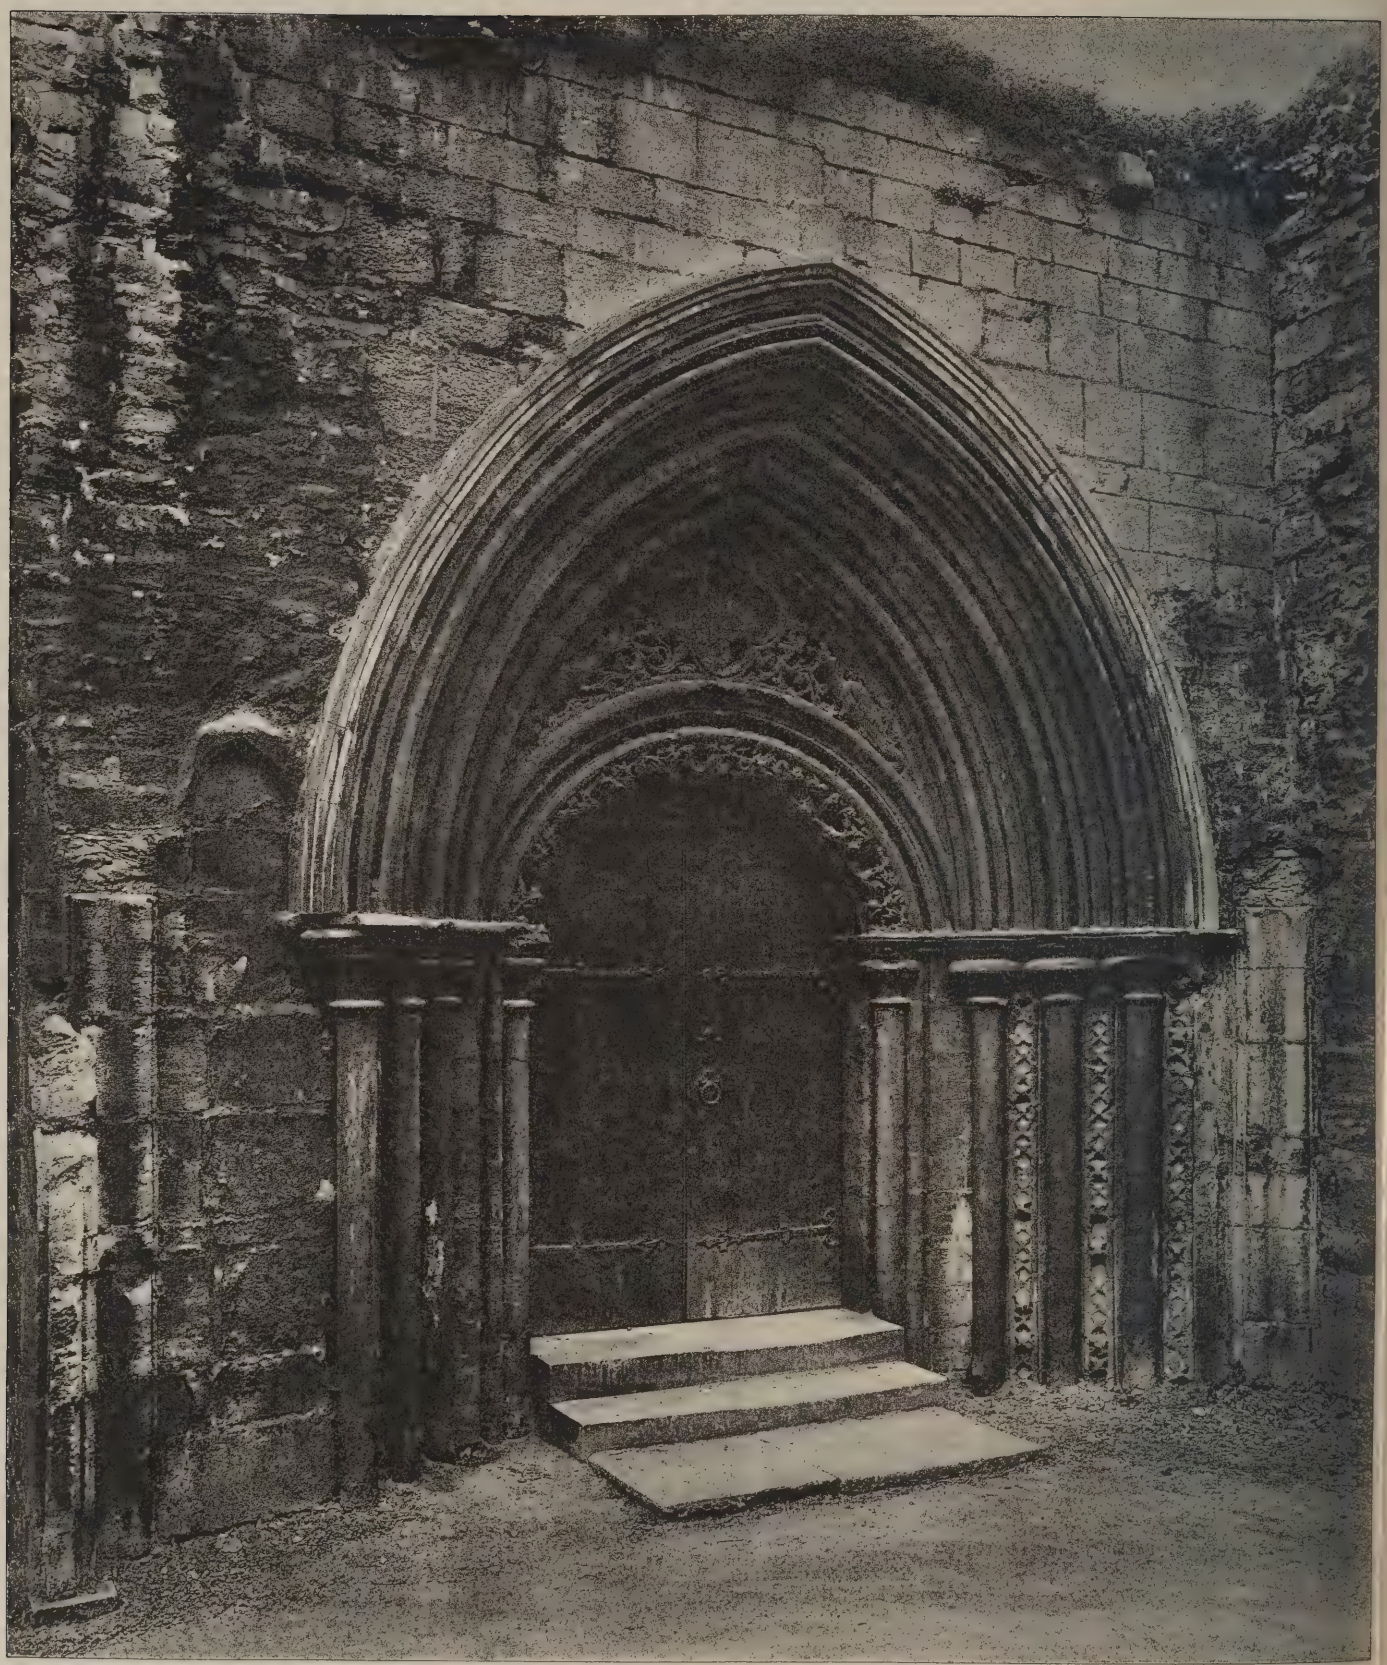
ELECTRIC LIGHT WIRING.

THE
NATIONAL SYSTEM
IS THE
Safest, Cheapest & Most Durable.
NO WOOD CASING OR OTHER PERISHABLE MATERIALS USED.

The System possesses all the advantages of Concentric, Iron Barrel, or Conduit, at half the price, without their disadvantages.

Installed at the
LIVERPOOL NEW HEAD POST OFFICE,
DERBY TECHNICAL COLLEGE,
WEST HAM TECHNICAL INSTITUTE,
WALLASEY PUBLIC BUILDINGS and FERRIES,
METROPOLITAN FIRE BRIGADE HEADQUARTERS,
Numerous Churches, Hospitals, and Mansions.

INSTALLATION WORK CARRIED OUT FOR THE TRADE.



ESTIMATES AND PARTICULARS FROM
THE NATIONAL ELECTRIC FREE WIRING CO., LTD.,
FARADAY HOUSE, CHARING CROSS ROAD, W.C.

Clarendon Road, South Shore, Blackpool.
45 Copenhagen Street, Worcester.
16 Guildhall Street, Lincoln.

DESIGN FOR PROPOSED JUBILEE CLOCK TOWER, LEWISHAM.

Messrs. WILLIAM G. HUNT and VINCENT STEADMAN, Architects.

The Architect.

THE WEEK.

A social problem for which an urgent solution is demanded in many places is the providing dwellings for a poorer class than the tenants of the ordinary "model dwellings." The Dublin Corporation have had plans prepared by the city architect which show dwellings that can be let at one shilling and threepence per week. That sum will defray the cost of maintenance, collection of rents, &c., besides allowing 2½ per cent. on the capital sunk. But the site must be provided without cost. It is not easy, however, to obtain sites in Dublin, for after five years the Corporation have not secured possession of the land required for an improvement in Bride's Alley, although the outlay up to the present has amounted to 36,500*l.* In Liverpool an association is being formed called "The People's Homes, Limited," that will provide dwellings for those who cannot pay more than two shillings to two shillings and twopence. One of the latest experiments is "The Family Home" in Glasgow. This is a large building capable of accommodating 600 people. One half of the block is for women with children, and the other half is for men with children—men whose wives are dead. There is a staff of servants who attend to the children while the parents are out at work. A similar provision is desirable in many other places.

The connection between the leasehold system and defective building has been often pointed out. In Ireland, where agriculturists can obtain leases that are almost in perpetuity, a feeling is arising that tenants of houses in towns should have similar privileges. It inspired a paper read by Mr. Field, M.P., in Dublin, on "terminable leaseholds in regard to municipal sanitation." He said that the ground landlord took over absolutely the houses built by the tenant. The absence of security for the tenant was a direct incentive to carelessness in everything, particularly sanitation. The present system discouraged enterprise and thrift among working classes and prevented the operation of building societies. It encouraged jerry-building and maintained badly constructed houses. All the sanitary defects which the system gave rise to could be very easily changed if occupation meant ownership. The terminable leasehold system was the father of slums and the progenitor of disease. Rent was to the ground landlord the prime necessity. Health and sanitation and human comfort were seldom considered in opposition to rent, and it was next to impossible to expect that a middleman or a house-jobber, or an experimenting agent, or a holder of premises with a lease nearly expired, would lay out money for the benefit of the ground landlord, who seldom had any regard whatever for the health of the inhabitants. Mr. J. S. Baxter, a barrister, also read a paper, in which he maintained that the real crux of the problem of municipal sanitation, in regard to dwellings, was the housing of the working classes. The Act of 1890, and the powers of demolition and reconstruction which it gives to local authorities, usually results at best in the erection of those blocks of model dwellings which he could but regard as a make-shift for something still better. That "something" was the provision, where practicable, of isolated suburban working-class houses. Even in their larger cities increased railway facilities might do much to enable an artisan to live in the suburbs and yet be within reach of his work. And he confessed that he was in favour of State assistance being given to the working classes to facilitate their becoming themselves the owners of their homes. This was recommended by the Royal Commission of 1885 on the Housing of the Working Classes; and since then much valuable experience had been gained in the somewhat analogous working of the Irish Land Purchase Acts. If they believed in a peasant proprietary might they not also believe in an artisan proprietary for towns? An advance would be made to the tenant of perhaps four-fifths, perhaps the whole, of the amount necessary to purchase a house, and this he would repay with interest by yearly instalments. If these instalments were made to extend over thirty years—not an unreasonable time—they would, even including interest at 3 per cent., be individually less than the rent he had been paying, although the purchase price were calculated so high as fifteen years' purchase of the rent. He could not now go into the details of such a scheme. But it was already within the domain of practical politics. If carried out, it would not merely benefit the industrious and encourage the thrifty, but it would directly and powerfully assist in promoting municipal sanitation. Another speaker thought the whole difficulty would be overcome if an Act of one clause were passed providing that all existing tenures should in future be considered perpetuities.

It is now proposed to effect a thorough restoration of the eastern group of buildings belonging to St. David's Cathedral. According to Mr. J. O. Scott, they form a "very important and especially beautiful part of the cathedral, but are in a state which can only be described as little better than ruinous. The eastern chapels at St. David's are a peculiar feature, being quite unique in their arrangement; they form an integral part of the building, while they are in a great measure cut off from the rest of the cathedral. The group consists of Bishop Vaughan's noble chapel, lying immediately beyond the east wall of the presbytery, of the vestibule of the lady chapel, and, still farther east, of the lady chapel itself, which is the largest and most important of the group, which lies east of the vestibule, though not central with it; and finally, of the later continuation of the north and south aisles of the early English presbytery, which runs past the end of Bishop Vaughan's chapel and vestibule, extending a little farther on, so as to overlap the lady chapel." The restoration of these interesting and very beautiful buildings is intended as a memorial to three good and great men who were for many years closely associated in the service of the Church in the diocese, and were scarcely parted in their death, for they "fell on sleep" in the same year (1897), and within a few months of each other, viz. Bishop Basil Jones, the distinguished scholar, theologian and antiquary, who presided over the see; Dean Allen, who loved each stone in the cathedral, and lavishly spent time and treasure in restoring and beautifying it; and Dean Phillips, whose varied gifts were almost exclusively devoted to the service of the Church in the diocese. This, with other work, will necessitate an expenditure of not less than 12,000*l.*, and Dean Howell, in his appeal, says:—"Engaged as we are in effecting a thorough restoration of the mother church of the see once presided over by the patron saint of Wales, we feel that we may justly claim support, not only from all Welsh Churchmen, but from British Christians of all creeds and classes, both within and without the Principality." Subscriptions may be paid to the Dean, or to Mr. W. S. de Winton, at Lloyd's Bank, Haverfordwest, or the National Provincial Bank, Carmarthen.

Blackpool is in need of a few large hotels, but it is doubtful whether they ought to be erected by the Town Council. If public authorities will meddle with business of the kind there is no reason why they should not monopolise other kinds as well. New laws in social economy would have to be devised. At present the law of licensing appears to be an obstacle to municipal hotels which is not easily surmounted. On Tuesday the Blackpool Town Council applied for a license for an hotel to be erected on land belonging to the Corporation in South Shore. It was designed by Mr. E. G. Stead, and was to cost 36,400*l.* Evidence in support of the application was given by residents. The opposition appealed to the magistrates not to establish a precedent that might become dangerous and lead to abuses. There was another application for a public-house in a different part of the town also by the Corporation. The magistrates declined to grant a license in either case. The expenditure of so much money would be advantageous in Blackpool, but private enterprise is likely to supply what is required, although the Corporation may oppose.

THE BRITISH MUSEUM.

THE revelations about the Science and Art Department are enough to make men despair of the fate of Great Britain should any crisis arise in which it will be necessary for the officials of any of the public offices to take part. The report of the British Museum for the year ending March 31, 1898, has since appeared, and for many people will serve as a corrective of the apprehensions which the inquiry by the select committee on the museums of the Science and Art Department had aroused. The committee have recommended for adoption in South Kensington and the other museums of the Department some of the principles which are followed in Bloomsbury, and by adherence to them the misfortunes which hitherto have appeared to be inevitable may be avoided in the future. But if some of the assistants who were trained in the British Museum were placed in charge of different sections of the Science and Art Department, more would be done towards restoring confidence than by any attempt to reform the present officials.

The British Museum has the disadvantage of a building which is over-monumental in style. It is suggestive of long duration, and consequently was supposed to be in keeping with antiquities. Smirke could not have foreseen that people would one day expect a museum to become a place of recreation. The buildings in Bloomsbury are not attractive to the public, and the collections lose much of their interest from the chilling surroundings. As a consequence, there was only a slight increase in the number of visitors last year, and "the steady annual diminution of the number of evening visitors has satisfied the Trustees that they would not be justified in continuing to incur the expense of keeping the galleries open in the evenings." Dull as London is, the museum is evidently considered to be worse, and even strangers cannot accept it as a refuge. If the walls were properly decorated the galleries would become less deterring, but with so extensive a building the expense must be onerous. The substitution of skylights has enabled the objects in the cases to be more clearly seen, and we suppose the improvement will be continued wherever it is practicable.

In all departments there have been additions. The department of Printed Books has obtained eighty-nine autotype facsimiles of royal proclamations from Henry VII. to Philip and Mary. A copy of the old "Doctrinal of Sapience," printed by William Caxton, which was formerly in the Ashburnham Library, was purchased, and one of Chaucer's "Troylus and Cresseid," which was produced by the press of Wynkyn de Worde in 1517. A most valuable addition is the Malermi Bible printed in Venice in 1490, with woodcut illustrations, for which the drawings were made by celebrated artists. The Bible is one of the greatest of bibliographical treasures, and as exemplifying Italian design at its best it is of great value to artists. Another acquisition is a Hieronymite missal produced at Zaragoza in 1511, which was considered by the printer Georgius Coci to be one of the finest examples of his art.

The manuscripts added are of great variety. There is a papyrus of the first century containing the thirteenth and fourteenth books of the "Iliad." As they relate to the contest in which Neptune took a share, and to the inveiglement of Zeus by Hera, we cannot imagine they were copied to afford enjoyment by themselves. They must have been part of a larger papyrus containing the whole of the epic. Of more importance is the papyrus, which is at least a century older, containing the poems of Bacchylides the Greek, and the only copy which is known to exist. Some of the poems are novelties to scholars. Out of the twenty there are six which are complete, and there are substantial portions of eight. As exemplifying a later time, we have the diary of C. B. Vignoles, the railway engineer, during 1830-33, thus with the diary already presented completing his record for the period 1830-62. He devised the double-headed rail, and was the first to lay out colonial railways. His diary is of importance to anyone who attempts the history of engineering. The score of the "Brides of Venice," by J. F. Duggan, will have interest for playgoers, especially as it was presented by the Julia St. George who, with Madame Vestris, used to charm the town in Planche's extravaganzas. As every year rubbings of English and foreign brasses are added the Museum collection must by this time be at least complete; the latest donor is the late Rev. William Creeny, of Norwich.

The department of Prints and Drawings was enriched by 5,053 examples. In addition, the late Sir A. Wollaston Franks, who was a loyal servant as well as a munificent benefactor of the Museum, has bequeathed about 45,000 English book-plates and 35,000 foreign examples, forming probably the most valuable and important collection ever formed. In the literary and social history of the eighteenth century Mrs. Delany's name often arises. An elegant amusement which occupied the ladies of her time is recalled by a collection of 974 flowers and plants executed in "paper mosaic" by her hands. The wood blocks, numbering 422, cut by Mr. W. H. Hooper from drawings by Sir E. Burne-Jones, William Morris and Walter Crane for the Kelmscott "Chaucer," are now a part of the Museum property. Several sketches and studies by the late Lord Leighton were acquired. Mr. Strang has presented twenty-seven studies in pencil and silver point, besides eighty-seven impressions of his plates in various states.

From English art of our time to the art of 3700 B.C. is a vast stride, but to those who utilise the British Museum greater transitions become easy. The interest in ancient Egypt comes closer to us than ever, for Great Britain has accomplished feats which would have daunted the Pharaohs. The forty centuries can look down on us from the Pyramids with more approval than on the selfish deeds of Buonaparte and other robbers. The portion of a cornice of a door, the false door, and the portrait statue of An-Kheft-Ka, "a royal relative," and of An-Kheft-ek, which belong to 3700 B.C. or thereabouts, are therefore welcome additions. But there are many other ancient examples. From Assyria a mace-head of an early king is inscribed with an account of the building of a temple, a seal shows a conflict with scorpion men, and there are three cylinders which are among the finest examples of Babylonian seal cutting, and none of them is later than B.C. 2500. The contract tablets that are buried in Babylonia appear to be endless. One "find" was rewarded with no less than 864, most of them dating from about B.C. 2200.

The First Vase Room has had to be partially rearranged in order to display the terra-cotta sarcophagus from Clazomenae, which is remarkable for its series of painted decorations. There have been additions to the Greek and Roman antiquities of works or fragments in gold, silver, bronze, marble, terra-cotta, &c. In addition to their value as examples some of them have importance as evidence for archæological problems. Thus of a terra-cotta bowl, which bears a representation of the story of Persephone, it is said :—"The entrance to the lower world is indicated by a stelè on which is inscribed the word 'eusebôs,' and this, perhaps, may be taken as conclusive evidence that the usual form of Greek tombstones or stelæ, representing a portal, was intended to indicate the portal of Hadès."

From the tombs at Maroni and Tekké in Cyprus several examples of jewellery were obtained. According to the report, "The excavations in Cyprus, which had ceased in September 1896, when the site of Enkomi, near Salamis, was exhausted, were resumed in November of last year on a new site, that of Maroni, between Larnaca and Limassol, where were found tombs of the Mycenæan age. The results were at first promising, but after a short time it was deemed advisable to transfer operations to another site, close to a tekké or sacred tomb near the Salt Lakes of Larnaca. Here also the tombs proved to be of the Mycenæan age, and productive of good results, so far as it was possible to carry them with the funds then available. The excavation of this site is being continued in the present year." Cyprus has been rather disappointing as a treasure island, but we suppose its numerous masters in successive ages have carried off the relics.

It is admitted in the report that the most important acquisition of the department of British and Mediæval Antiquities was the collection of gold ornaments from the North of Ireland. In the House of Commons there was some talk on the subject during the last weeks of the Session, and the Irish members have returned home with the conviction that the Government intend to arrange for

the transference of the objects to the Dublin Museum. The opinion of the keeper, which no doubt is also confirmed by the trustees, is as follows :—"This important find is of exceptional interest at the British Museum, as the objects, which may be attributed to the beginning of the Christian era, belong to a class specially connected with Britain, and in which the Britons attained to greater perfection than did any of their continental kindred. The Museum, moreover, possesses already the most important collection of bronze remains of this period of culture, which these gold objects will supplement and enrich in a useful way." The aim of the trustees has been always to make the collections in the British Museum as comprehensive as possible. Students of archæology, foreign as well as native, have a right to expect sufficient examples to illustrate the relations between objects of various countries and periods. In Dublin, as in Edinburgh, opportunities should be given to those who wish to study Celtic art, but that is no reason why in London Celtic art should be ignored. There is an abundance of goldsmiths' work in the Dublin Museum, but as that variety of art is not exemplified in London, the trustees were justified in filling up the void in their collection. It was unfortunate for the Government to talk as if the trustees were over-grasping, and in that way to create an illusion which is sure to end in the familiar cry of injustice to Ireland. The gold objects consist of a collar with ornament of late Celtic character in relief, a twisted collar of solid wire and part of a second similar one, two neck chains, a bowl of very thin metal, and a model of a boat, with oars and other implements.

Among the numerous additions is the fifteenth-century Scottish brooch which is stated to have been in the possession of the CAMPBELLS of Glenlyon for many generations. It is of unusual size for a brooch, circular with a bar across the middle, and having two pins. The front is set with stones and pearls and is somewhat rudely worked ; the back has the names of the Magi as a charm. Another interesting object is the double matrix of the seal of JOANNA, Queen of Sicily and Countess of Toulouse, daughter of HENRY II. of England. It is of silver, and has on each half a figure of JOANNA, in the one case as Queen and in the other as Duchess of Narbonne, Countess of Toulouse and Marchioness of Provence, as shown by the legend. She married WILLIAM II. of Sicily in 1177 and the royal half of the seal was probably used by her during his lifetime. After his death she became in 1196 the wife of RAYMOND VI., Count of Toulouse, and died three years later. The matrix was found in the ruins of the Cistercian Abbey of Grandselve (Tarn et Garonne).

The department of British and Mediæval antiquities is the most elastic of all in the Museum : for the oldest as well as the latest work a place in it can be found. Consequently there is nothing inapposite in bronze medallion portraits by DAVID (d'Angers) of CANNING, BRUNEL, Sir JOHN FRANKLIN, Sir J. ROSS and others, or an ivory statuette of Bacchus by Baron DE TRIQUETI, or Sir DAVID BREWSTER'S microscope, &c.

Anyone who wishes to keep up his history, mythology and geography, as well as his knowledge of one variety of art, cannot do better than pay attention to the annual additions to the department of Coins and Medals. Thus one British coin which is inscribed "Carte" is a proof that it was struck by Queen CARTIMANDUA, who is known in history as the betrayer of CARACTACUS. She rebelled against her husband VENUTIUS in A.D. 69, and, in conjunction with VELLOCATUS, the king's armour-bearer, succeeded for a short time in ousting him from his kingdom, as is recorded by TACITUS. In Greek coinage there was always a connection between the city where it was minted and the animal or device on the obverse. But what is the signification of a toad or frog that appears on a silver stater of about B.C. 600, and which may belong to the Cyclades? Another stater, bearing a head of PERSEPHONE, bears traces of an engraver's signature, which is assumed to be KIMON. If so it testifies that the renowned Sicilian artist was employed to prepare dies by the Locrians, and would show that in the old days the difference between great and small in works of art was not so influential as in our time. A pattern on a coin from Delphi is said to resemble a temple ceiling of the coffered type. Before Corinth was destroyed Tenea was only a village ; then i assumed importance, and possessed its own mint. In the Mediæval series one of the most curious is a gold piece struck at the Abbey of Thorn, in the province of Limbourg, Belgium, by the Abbess MARGUERITE DE BRÉDERODE, A.D. 1531-77. The coin is a close imitation of the English angel of the time of HENRY VIII. The reverse legend is "Moneta Nova Avrea Thorensis." The coin by itself is enough to show the power of nuns among the Flemings.

The report is most satisfactory, and the administration of the Museum is worthy of imitation elsewhere. In fact, the Museum authorities, in addition to their ordinary duties, have suggested one of the most efficacious means of solving the problem of technical education. The probationers and junior assistants have a definite course before them, and do not lose themselves in the mazes of universal knowledge. Subsidiary subjects need not be neglected, but they are not allowed to divert attention from whatever is essential. In some of the large works in England, such as ARMSTRONG'S in Elswick, a similar system has been adopted, with great advantage to the firm as well as to the students and apprentices. But it should be more generally followed. In business specialisation should be paramount, and what is true in Bloomsbury is no less adapted to Birmingham. When what is known about the most important subject is exhausted, it is time enough to deal with accessories and superfluities.

GROUNDS OF WALLS AND PAINTINGS.

A PARAGRAPH has been running through the papers this week concerning the colouring of a church in Guildford. According to it a contract was entered into for painting the interior of the building, and parishioners, committee, churchwardens and rector were horrified when they found that in one part the walls were being covered with a pale green paper above with carpet brown below. Probably the use of paper is merely an experiment. To outsiders it may seem an easy task to prescribe the colour for walls. They believe there are only a certain limited number of paints, and all that has to be done is to make a selection. An architect would therefore be justified to employ paper or other material that would enable him to judge how far the lighting and other circumstances of the church would affect the colours he proposed to adopt.

The generality of people have not even elementary notions of colour. That fact is manifested whenever they select papers for covering the walls of rooms. There is no doubt that pleasing room-papers are obtainable at moderate rates, and in no branch of manufacture is the progress of taste more evident. Designs by artists of standing, in colours which can be described by the old formula "mixed with brains," can cover walls without much sacrifice on the part of the occupant. But at the same time the average pattern-books which a builder and decorator submits to his patrons are filled with forms and colours which should pain instead of gratifying the eyes. Unfortunately they are most in request, and those who pay for the vulgar papers wonder why they are disappointed when the paper is fixed in their rooms.

If the owners and tenants of houses and flats would only endeavour to realise what power the colour of the walls can have upon the nerves, we should then see more eagerness to obtain papers and paints that would attain the effect contemplated. In that strange but vigorous romance, "Flames," by Mr. HICHENS, we can read some remarks on the subject which most likely were inspired by a study of books on psychological medicine. One of the characters has a flat in Victoria Street, Westminster. In the days when his mind was in a healthy state, before he began to experiment in occultism, his drawing-room was dominated by a picture of the modern religious type, *The Merciful Knight*, and the room was, so to speak, luxuriously ascetic. But a change takes place in the man, and one of the results is a transformation of the drawing-room. To a nerve-doctor who awaits the owner in the room, the colours about are a revelation. The writer tells us :—"The doctor was aware of a deep and dusty note of red in the room, sounding from carpet and walls, tingling drowsily in the window curtains and in the cushions that lay upon the couches. This was was not the crude and sealing-wax red with which the festive Philistine loves to dye the whiteness of his dining-room walls,

cooling its chubby absurdity with panels of that old oak which is for ever new. It was a dim and deep colour, such as a dust-filmed ruby might emit if illuminated by soft light. Everywhere, as a deep and monotonous bell ringing relentlessly through a symphony of discordant and crying passions, there sounded that sinister note of deep and dusty red. Despite his own complete health of mind, and the frantic disquisitions of the morbid NORDAU, the little doctor felt as if he heard the colour, as if it spoke from beneath his very feet, as if it sang under his fingers when he laid them on the brocade of a couch, as if the room palpitated with a heavy music which murmured drowsily in his ears a monotonous song of dull and weary change." We must allow a writer of Mr. HICHENS's power to have full swing, but what he says is not falsified by experience in this neurotic age. The colours of walls and carpets exert more influence over people than they may be willing to admit, and it cannot be said we are always above the operations of colour in church. If the Guildford architect wished to experimentalise with paper in order to produce or to avoid certain effects, he deserves credit rather than mockery. But as we have started the subject of colour especially in grounds, or, as the French say, *fonds*, we may consider another aspect of it.

When we find the great picture by REMBRANDT in the Amsterdam Museum is universally known as the *Night Watch*, it is impossible to avoid the conclusion that whoever originally employed, as well as the people who afterwards accepted, the title must have had strange notions about the qualities which distinguish night from day. It is true REMBRANDT was fond of the contrasts which night allows. As BYRON says, he could make darkness equal light, and therefore a fallacy might arise about his restricting his pencil to night scenes alone. But a glance at the picture should be enough to demonstrate there was no intention of representing a nocturnal assembly. The designation at length became inseparable from the work, and when an etching is made it is expected to be as black as printing-ink will allow. The case is only one among many which could be cited to prove the weakness of the colour-sense, or rather of the power to discriminate between tones which seems to be inherent in mankind.

It was no doubt on account of that weakness so many of the Italian painters adopted conventional arrangements. In the pictures which were prepared for churches the figures can be identified by colours as easily as by symbols. Works of the later Renaissance period show almost an indifference to symbolism. But blue robes, golden hair, green gowns, brown raiment, &c., are so carefully retained, there is little difficulty in the interpretation of the pictures. Respect for what was handed down from one generation to another, and which was not based on nature, could not fail to have an injurious influence on art. Something of the kind was seen also in the representation of trees, rocks, hills and buildings in the backgrounds of pictures and occasionally in other parts also. It is now incredible how painters who lived amidst country scenes could imitate nature so abominably, or how country folks could accept such forms as representations of things with which they were familiar. In course of time there was an improvement in forms and conventionalisms were gradually abandoned. But while the outlines of rocks became less bizarre the stereotyped colours were allowed to remain. Less than a century ago a brown tree was supposed to be an indispensable ingredient in landscapes which were intended to display all the glow of summer's verdure.

It is possible that many of the defects or inaccuracies which we see in the landscape backgrounds of Italian pictures were not caused by an inability to distinguish between the true and the false. The artists may have simply utilised the bizarre forms just as M. BONNAT does his broken tones in the grounds of his portraits. They were elements which could be transformed at pleasure. If we consider the rocks which DA VINCI introduced in his *Vierge aux Rochers* by themselves as representations of nature, they will appear as unnatural as anything we can see on a Chinese plate. But who would care to see them removed and a representation of a scene in the neighbourhood of Milan substituted? The strange rocky masses impart an air of mystery to the picture, and the figures in the foreground stand out with more vigour against a background that to some extent appears to be a mass of ice illumined with most delicate colours. This theory derives some confirmation from the old rule which was adopted in some of the Italian, Dutch and French academies. According to it the ground should be one of the first thoughts of the painter. With that object he was recommended to obtain canvas approaching in colour to the contemplated ground, to place it in front of the scene he proposed to represent, if a landscape, and to make experiments with colour upon it. With the dyed canvas an artist was supposed to be more impartial than with one which would have a ground laid on it by himself.

Another rule was to employ white objects, such as flowers, vases, blocks, as models to paint from. In any case, a white object is difficult to represent, and a common white china teacup is almost if not more trying as a model than TITIAN'S bunch of grapes, which by itself was supposed to go far towards training a painter. But it was not merely on account of the pains which were required to give an appearance of roundness or other qualities to an object without diminishing its constituent whiteness that the recommendation was expressed. It was because by the aid of white objects the effects of a background were most sensibly exemplified, as well as the effect of objects of other colours on white. Too often the background was the last part of the picture which was considered. Young artists supposed that every colour could be heightened and parts brought together into unity by the ground, and therefore it was wise to delay the treatment until the rest of the work was nearly completed. But that procedure was not always successful. It was not followed by GAINSBOROUGH, to name one artist, for, as REYNOLDS relates, he formed all the parts of his picture together, the whole going on at the same time, in the same manner as nature creates her works, and much of the charm of his work arises from that mode of treatment. A portrait by him is not a head with accessories by assistants, but a work which from its unity might be commenced and completed in one sitting. The few unfinished paintings left by GAINSBOROUGH are accordingly invaluable as revelations of his method. There might be more imitators of GAINSBOROUGH if painters did not conclude from the ancient examples, such as the pottery paintings of the Greeks, the golden surfaces of the Byzantines, and the uniform colour adopted in many Mediæval examples, that as backgrounds can have no part, or a very supernumerary one, in expressing a subject, their inefficiency should be recognised. There can be no general law on the subject. In decoration the background should not be obtrusive. But if carefully considered in their effects on the colours of the other planes of a painting, there is not much chance of error. The early works in which, from the excess of figures and details, the last plane became a sort of revelation of a different world, often injured the effect of the important parts of the picture, unless in those cases where monotony of colour was employed, and by which they approach the pre-Christian and early Christian decorative works.

THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE fifty-second annual meeting of the Cambrian Archæological Association opened at Ludlow on Monday, August 8, and was continued until the following Friday. Although not, according to strict geographical definition, within the boundaries of the Principality, the ancient town of Ludlow, which abounds in objects of antiquarian interest, is situated in the midst of an extensive tract of country possessing many associations with the history of Wales and border warfare. The Society last visited Ludlow in 1852. The retiring president, Sir Owen Scourfield, Bart., was succeeded by Lord Windsor, who has local connections with Ludlow.

Ludlow.

Buildings of antiquarian interest in Ludlow were first examined. The members assembled in the Castle Square at 9 A.M., and proceeded to inspect the castle, which stands on a rocky promontory at a height of more than 100 feet above the junction of the Corve with the Teme to the west of the town. Mr. C. Fortey conducted them over the building. The castle

was founded in the eleventh century by Roger de Lacy; it is composed of an inner, middle and outer ward. The inner ward occupies the south-west angle of the middle ward. The south wall divides it from the outer ward, and its western wall is part of the general enceinte. Its two other walls divide it from the middle ward. This ward has three towers, the keep, the bake-house and the postern, at its south-east, south-west and north-west angles. In it is the well. The middle ward contains a pile of Tudor buildings over and about the gateway, built against the south curtain, which is of Norman date. Along the north curtain is the grand mass of the state and domestic buildings, being of mixed Norman and Decorated date, and composed of the buttery tower, the hall, the state and private rooms and the square tower which occupies the north-east angle of the ward. In the centre of this ward stands the chapel, dedicated to St. Mary Magdalen. All that remains of it is the circular nave, 28 feet in interior diameter, with walls 4 feet thick. The entrance-door to the west is a fine example of enriched late Norman work. Round its interior walls is an arcade of fourteen arches resting on a low stone bench. The arches are alternately chevron-moulded and beaded, the capitals cushion-shaped and roughly ornamented. Above the arcade was a timber gallery resting upon twelve corbels, of which one is decided Norman and one Early English. Its chancel was standing in the reign of Charles II., and had two Tudor windows in its north wall and windows in the roof. This chapel is, with great probability, attributed to Jocelyn de Dinan, in the reign of Henry I. (1100-35), the Temple Church, which it resembles, dating from 1127. The outer ward contains but few buildings. Near the centre of its curtain is the principal entrance, in rooms over which Butler wrote his "Hudibras," being secretary to the Earl of Carberry, Lord President of the Court of the Marches, 1649-72. Built against its south wall is a range of Tudor buildings, probably stabling. One square tower of early date stands on the east wall, and another, later and semicircular, on the west wall above the river, bears the name of Mortimer. When the Court of the Marches was finally abolished (1689), the castle was suffered gradually to decay.

The church, dedicated to St. Lawrence, and one of the finest parish churches in England, was next visited, and the Rev. Prebendary E. ff. Clayton acted as guide. The church has a nave, side aisles, transepts and choir, with side chapels. The south porch is hexagonal, similar to but earlier than that of St. Mary, Redcliffe, Bristol; there is a large plain Norman font. The choir is separated from the nave by a handsome screen; its stalls are good examples of fifteenth-century work and have misereres well worthy of notice. In the sixty-five compartments of the east window is illustrated the life of St. Lawrence. Only the upper part of the reredos, containing a number of small figures in tabernacle work, is original. In the choir are also several sixteenth-century monuments. St. John's Chapel is to the north of the choir. The glass of the east window depicts the Legend of the Ring; the story is as follows:—King Edward the Confessor, having no money to give an old beggar, gave him a valuable ring. Some time after, the same ring was given to some pilgrims in the Holy Land by an old man, who told them to give it back to the king as a token that he should shortly afterwards die. The pilgrims, who are stated to have been Ludlow men, on their return did as they had been ordered to do. On the back of the stalls dividing the lady chapel from the choir is a copy of the Ten Commandments, somewhat abbreviated, painted on panels in Old English characters, apparently of the reign of Elizabeth, 1560.

Hosier's almshouses, to the west of the church (founded in 1468, but rebuilt in 1758), and in a line with it the college, lately made a cottage hospital (retaining its fifteenth-century portal), and the Reader's house, close by, having been seen, the Bull Inn (an interesting old house), where may be seen the sixteenth-century panelling with coats-of-arms, once in the castle chapel, was visited. Then a move was made to the Feathers Hotel, the well-known black-and-white timbered house, with the coffee-room ceiling divided by moulded beams into three compartments filled with intricate ornament. In an adjoining room are the Fox arms, on a carved panel over the door. The arms are a chevron, between three foxes' heads erased (Fox), impaled with three hatchets proper (Hackluit). The Museum of the Ludlow Natural History Society, which contains a fine collection of Silurian fossils, many relics from the castle church and monasteries of the town, municipal charters and documents of the Guild of Hammermen in the original seventeenth-century oak chests, and the Grammar School, were also visited. In the fifth year of Edward VI., 1552, a new charter was granted to the school, which states that a grammar school had been maintained by the Palmers' Guild. The building has a pointed door and three fourteenth-century windows. Barneby House, the lodging place of pilgrims on their way to St. Winifred's Well, with some Early English remains, the Broad Gate, the only remaining gateway, and Ludford House, which is approached through an Edwardian archway and formed part of the Hospital of St. John in the thirteenth century, were duly inspected. At the Dissolution the house was granted to the Earl of Warwick, who sold it to William Fox, secretary to the Council of the Marches. Fox was buried in Ludford Church in 1554. It was sold again in 1667 to the Charltons. Sir Job Charlton, Speaker in 1686, entertained James II. here in great state in 1687. Ludford Church, with a brass to William Fox (who is represented as clad in plate armour of the early part of the sixteenth century) and his wife Jane, proved interesting to the party.

The Presidential Address.

A public meeting was held in the Town Hall, Ludlow, at which Sir Owen Scourfield presided. He said it now became his duty to give up the reins of office to his successor, and that successor was very well known to many of them there—Lord Windsor. They had made many expeditions in various parts of the country, but they were now visiting the most beautiful part of very beautiful Shropshire. He did not think the Society in visiting Ludlow were, archæologically speaking, going out of their own country, for he always believed that Wales actually began at the western side of the Severn, and his experience had been that in a town nearer the Severn than Ludlow the people were as Welsh as ever they were, and always would remain so.

Lord Windsor, on taking the chair, said he wished to thank the Society, first of all, for the honour they had done him in electing him president for this year. He had been looking over some of the transactions of the Society, and some accounts of their past meetings, and he noticed that with very few exceptions their past presidents had opened their remarks with some apology for their unfitness for the office. It was not because of any exaggerated idea of his archæological knowledge—he would remind them that they themselves were to blame for electing him—that he did not ask but claimed their kind attention and patient ear while he made a few remarks in opening the proceedings. There was no doubt about the importance of this country or about the stirring events which must have taken place during the struggles of the Romans and Britons for the border counties of Wales; and whether the great battle which ended in the defeat of Caractacus really took place near Coxwall Knoll, between the Clun and the Teme, or whether, as seemed more probable, the site was thirty miles further north on the banks of the Severn, the portions of Roman roads and the numerous Roman as well as British encampments abundantly testified to many such bloody encounters between invaders and invaded. But the position of Ludlow as the centre of this interesting country—its importance and magnificence—were of later date. He could well imagine that King Arthur's knights, as they came upon the valley of the Teme during their wanderings, and followed the river past the Druid oaks at Oakley Park, must have seen an enchanted castle rise up before them on the rocks in the valley—some prophetic vision of the stately pile of which now, alas! we saw but the ruins, but which from its foundation at the end of the eleventh century to Cromwell's time played a most important and brilliant part in the battles and the pageants, the love-makings and the treacheries of those stirring Mediæval times. The oldest part of the castle, the keep or dungeon tower, was believed to have been built by Roger de Lacey, and so far as they were able to retain it against their foes, or against the will of an offended sovereign, was more or less in the possession of the Laceys till it passed by the marriage of the heiresses in 1244 to the De Genevills and De Verdons, and later by another marriage in 1316 to Roger de Mortimer, and finally became the property of the Crown. Afterwards it became the official residence of the Presidents of the Council of Wales and the seat of the Court of the Marches. But the most interesting event in its later history was the writing and performance of Milton's "Mask of Comus" in the Banqueting Hall, in 1634. We were told in Todd's edition of Milton that "Lord Bridgewater, being appointed Lord President of Wales, entered upon his official residence at Ludlow Castle with great solemnity." Thither came his children, Lord Brackley, Mr. Thomas, and Lady Alice Egerton, from Herefordshire. They were lost in Haywood Forest. This was the foundation of Milton's poem. But it was not so much in the fact that it was first performed in the banqueting-hall at Ludlow that the chief interest of the poem lay, but that only a few miles from this spot Milton found the origin of his inspiration and the local colour of his scene. Comus's valley was still to be found, and in that delightful woodland scenery, where imagination ran riot, they could picture to themselves the haunts of the wizard, and people if they pleased his rabble crew with their own unloved acquaintances. But this seemed to have been the last brilliant flash in the history of the castle. In 1646 came Brereton and his Roundheads. They took possession of it, and immediately inventoried its contents and offered them for sale, and the president's court was practically abolished, though not actually so till 1688. It remained for the hopeless dulness of the Georgian times to complete the destruction which Cromwell

had begun. In the reign of George I. the lead was ordered to be stripped off the roof, and the castle's ruin became complete. The first act was the outcome of a violent animosity against the Crown and the old order of things; the second was the result of pure and unadulterated stupidity, owing to an entire absence of appreciation of all beautiful things that did not conform to the narrow and artificial taste of the day. Thank God they had touched the bottom, and they could claim to live in a second age of renaissance, wherein, whatever might be their faults, they felt a real appreciation and reverence for the beautiful creations of the past, which they might some day emulate, even if they could not eclipse. His lordship concluded by again welcoming the Society to Ludlow, and hoped that the members for themselves would feel at the end of their visit that they had spent a profitable week there, and he was perfectly certain their visit would be profitable to the inhabitants, because it made them interested in their own surroundings and in the preservation of their ancient monuments.

Caractacus.

Mr. Jasper More, M.P., read a paper on Caractacus, in the course of which he said they derived the most accurate account of what was done in that district in the first century from Tacitus, the son-in-law of Agricola, the governor who finally pacified Britain. The name in Latin was Caratacus, not Caractacus, in Welsh Caradawg, and in British Caradoc. Caratacus was one of the sons of Cunobelin—the Cymbeline of Shakespeare—who reigned at Colchester. The attack of Aulus Plautius on Caratacus, made after the death of Cunobelin, was only given by Dio Cassius, whose grandmother was a contemporary, A.D. 50. Caratacus retreated before Ostorius Scapula, and then it was that the camps extending through Herefordshire to Montgomeryshire bearing his name were used. This led Hartshorne, the secretary of the Society of Antiquaries, to argue that the last battle took place on the Breidden, in which case the retreat would be through the difficult but beautiful ground leading from Clun to Bettws y Crwyn, with a large camp at Caer Caradoc, near Clun, and other camps at the Burg Ditches, Bettws, and probably Churchstoke, which formerly bore the name of Chestoke, or camp. Caratacus had a castle in South Wales, now belonging to Lord Dunraven, and another in Denbighshire. After the final battle Caratacus fled to Boadicea, whose capital was York, and she gave him up to his Roman enemies. Caratacus who had kept the Roman army employed for nine years, with his wife and daughter, were taken to Rome, and with an iron band around his neck and waist Caratacus was led in procession before Claudius and his wife Agrippina, the mother of Nero. Caratacus saved kimself and his family by the speech he made, and the scene was the subject of a painting in the possession of the royal family of France. He lived in respect with his family in Rome, and it was an interesting consideration that he might have been contemporary there with St. Paul. Quoting the last words written by St. Paul at the end of the second epistle to Timothy, "Eubulus greeteth thee, and Pudens, Linus and Claudia," Mr. More said when foreigners submitted to Rome they all took the name of the Emperor. Caratacus would, therefore, take the name Tiberius Claudius Caratacus, and his daughter's name would be Claudia. Caratacus's son was called Llyn in Welsh, which would be Linus in Latin. If Linus was the brother and Pudens was engaged to Claudia, and Claudia was the daughter of Caratacus, the order in which St. Paul mentioned them would be the natural order. Mr. More quoted Mr. Lewin, the author of the most elaborate life of St. Paul, Fuller, Archbishops Usher and Stillingfleet, Archdeacon Pryce of Bangor and others, in favour of the view that Claudia was the daughter of Caratacus. Dealing with the first introduction of Christianity into Britain, Mr. More said the Triads stated that the family of Caratacus brought Christianity back with them, and Claudia was said to have had three or four sons who were called saints. Discussing the site of Caratacus's final battle, Mr. More said Mediæval opinion favoured Caer Caradoc, near Clun, but Hartshorne argued the point and placed the site on the Briedden. If Hartshorne were correct the Romans must have been drawn through the difficult ground to Bettws, above Kerry, and if Caer Caradoc were the site, Caratacus must have retreated over that difficult ground to effect his escape. In conclusion he said we had no statue of Caratacus, and suggested that a good local monument would be collections of books on the period at Church Stretton, Clun and Ludlow. Incidentally Mr. More mentioned that Prince Arthur, brother of Henry VIII., and Catherine his wife, whose subsequent marriage to Henry brought about the Reformation, lived at Ludlow; that Edward III. came to hunt in Clun Forest and that Sir Walter Scott took his family to stay in Clun, and made the old castle and Powis Castle the scene of "The Betrothed."

Archdeacon Thomas said he thought their thanks were due to Mr. More for the very able paper he had read. The Archdeacon dealt at considerable length with the controversy which rages round the site of the last stand of Caractacus, and after pointing out in what manner the Church Stretton and Coxhall Knoll sites disagreed with certain details of the battle found in Tacitus, he expressed himself as being strongly in favour of the Breidden site.

Bromfield Priory.

The Rev. C. H. Drinkwater read the following paper on Bromfield Priory:—I have been asked to read a paper about Bromfield Priory, simply because some time last year a document was brought to me for transcription by your recorder, which I found to be a copy in English of a confirmation by Henry III., in July 1235, of certain charters to the prior and monks of Bromfield by his grandfather, Henry II. This document was in English, and when I had read it I considered it worthy of being put in permanent record, not merely for the quaintness of its language, but as being an almost unique specimen of fifteenth-century rendering of a Latin charter. To this, when it was ready for publication, I was enabled to subjoin in an appendix certain particulars relating to the final disposition of the priory estates at the time of the Dissolution, but I felt that very little was done even then to clear up the mystery which hung over the original foundation of this ancient ecclesiastical house. We know that it had its beginnings before the Norman Conquest, and that its territorial possessions were originally very large, but as the cartulary was lost, or rather non-existent, very little was known concerning the history of this religious establishment until in the reign of Henry II. it became a Benedictine priory, subject to Gloucester Abbey, and it continued such until the Dissolution. Of the early history, as I have said, very little is known; that little, however, is found in Domesday. Under the heading "Quod tenet Ecclesia Sanctæ Mariæ" we read in the Conqueror's record that "the same church holds Brunfelde, and there it is built. Here are now x hides, and in demesne vj ox teams, and there are xij neat herds, xv villains, and xij boors, with viij teams. It is worth 50*s.* annually to the canons, and Nigel the physician has 16*s.* annually from this manor. In this manor there were in King Edward's time xx hides and xij canons of the said church had the whole. One of them, 'Spirtes' by name, had alone x hides. But when he was banished from England King Edward gave these x hides to Robert FitzWimarch as to a canon, but Robert gave the same land to a certain son-in-law of his, which thing, when the other canons had shown to the king, forthwith the king ordered that the land should revert to the church, only delaying till, at the court of the then approaching Christmas, he should be able to order Robert to provide other land for his son-in-law, but the king himself died during those very festal days, and from that time till now the church hath lost the land. This land Robert now holds under Earl Roger, and it is waste, and was found waste. One part with another the arable land is sufficient to employ liiij ox teams." Eyton further presumes that Robert FitzWimarch is identical with Robert the deacon, that Norman ecclesiastic whose daughter Richard Scrob married. This intended restoration of the lands to the church was never effected, for the king died January 5, 1066. The church continued to be served by these xij or perhaps xj canons, without any ostensible head, till very early in the twelfth century, when the Saxon and Collegiate Church of St. Mary of Bromfield became a regular monastic institution, and Osbert, prior of Bromfield in 1115, attested an ordinance of the Viceroy. They in 1155 became Benedictine monks, and yielded up their church and all their lands to the abbey of St. Peter, Gloucester, whereupon a prior and monks were placed here, and continued till the Dissolution. The confirmation which I transcribed is dated July 19, 1235, and refers to a period eighty years after the change took place in the constitution of the house; Henry II. began his reign in 1154. In the first of the charters confirmed, he speaks of "prebendes held in the tyme of Kyng Henry, our grantfader." This would be Henry I., who reigned from 1100 to 1135, and would seem to show that the prebendes still existed in his day and were only gradually extinguished by death, for four of them are mentioned by name, and other canons are also referred to. The first charter of Henry II. styles the manor a "royal demayn," and the church a "lordly chapelle," and gives both manor and church to the "prior and monks there seruing God." It grants to the prior and monks, subject only to the life interest of the old canons, all the landes and towns of Hawford (Halford, near Craven Arms), of Dodynchop (*i.e.* Dinchope), of Efford, a lost place, which is once mentioned in the "Cal. Inq. P.M.," p. 42, as a township in South Salop, and under the name of Asheford. Esseford may refer to Ashford Carbonell, but this is only conjecture. ffelton (this is known as a member of the manor of Bromfield). Two places are mentioned, Clay Felton and Rye Felton. Here, probably, was a chapel served in Henry I.'s time by Robert, who is called "Prist of ffelton." Bourway (or Burway, the Latin has Burgeheye) is 1½ miles south-east of Bromfield. Johannes and Adam de Borewey are names found in a subsidy roll of 1327. Ledewich (alias Lethewick) is a township five miles north east. Halton (or Halentone); no doubt Priors Halton, close to

Bromfield; the others were Hill Halton and Lady Halton. All these were members of the manor of Bromfeld Nernes, which last is a very rare and difficult word, not altered except in the spelling in the Latin version of this confirmation, but here it probably means jurisdiction, the extent of the prior's vassalage. The charter goes on to exempt these towns and lands from all secular "seruices and exaccions." The second charter confirmed is one of the same king, Henry II., conferring facilities of free travel and passage through all his lands by "stret or wey in towne or in water in se and in haven," in addition to other privileges and exemptions on their own properties. The third charter mentions further exemption from all secular services and taxation. The fourth gives them the privilege of free chase and hunting in certain specified woods and forests, and forbids all royal foresters and other officers to meddle with them. The woods of Moktree and Ailncherwood, the land and pasture of Benet are mentioned, and all hunting and chasing by others are forbidden under a penalty of 10*l.* The last charter adds another wood, that of Esruge, to the former, speaks of hares as game and repeats the penalty of 10*l.* All these five charters are confirmed by Henry III., and the grants and gifts made firm and stable, the witnesses to the confirmation thus made being the Bishops of Durham, Salisbury and Carlisle, Geffrey, Earl Marshal, Hugh, Earl of Kent, Rauf the son of Nicolas, John the son of Philip, Geffrey Despencer, Geffrey Cawz and others, every one of whom was living in the year 1235. These scanty notices are about all we know of the history of this house, which as a religious establishment had existed in one form or another for nigh two hundred years, first as a collegiate establishment and then as a Benedictine priory. Pope Nicholas's taxation in 1291 gives this estimate of the prior's income as lord of this manor—

	£	s.	d.
Eight carucates of land that yielded per annum	4	0	0
The hay (10 loads at 1*s.* 6*d.*) was worth	0	15	0
The assized rents and tollage of natives amounted to	22	13	4
Pleas and perquisites of court, the labour dues and the fines on copyhold land were	3	0	0
The pannage of swine yielded	0	2	0
Three mills	3	0	0
Profits on stock (8 cows and 260 ewe sheep)	7	2	0
Making a total of	40	12	4

78*l.* 19*s.* 4*d.* was about the income which the priory derived from the manor of Bromfield and its adjuncts in 1534-35. At this period, the time of the Dissolution, the property had much increased in area and value. Many new names are found in the papers referring to it in the Augmentation Office. We may gather that the prior and monks had not neglected their worldly interests in the 300 years which had elapsed since the confirmation of Henry III. in 1235. An enumeration of the separate items may be of interest to residents of South Salop:—

Revenue of the Cell of Bromefeld.

	£	s.	d.
Assized rents in Bromefilde	10	18	8
,, ,, Burwey and Chapel	5	3	8
,, ,, Whitebache and Cleyfelton	6	14	4
,, ,, Ryefelton	9	19	4
,, ,, Dodyngethorp	3	3	8
,, ,, and Ledewych	4	0	0
	50	18	0
	10	19	4
N.B.—Some item omitted, for the total is only	39	19	8
Rent of certain lands in Overton field psh. Richard Castle	0	2	0
Farm of wheat tithe Hawford and Dodyngethorp	2	0	0
,, ,, Halton Prior and Ludford	2	13	4
,, ,, in Ledewyche Leete and Stevynton	3	10	0
,, ,, Halton of the Bd. Mary of the Hill	2	1	0
,, ,, Burwey, Chapell, Whytebach and Ryefelton	4	0	0
,, ,, Cleyfelton	0	14	4
,, ,, Asheford	3	6	8
,, ,, Bromefeld	2	0	0
,, ,, Cokerugge	0	13	4
Portion of tithes parish of Stokesay	0	8	4
Income of arable, meadow and pasture land	2	13	4
Rent of a water-mill in Bromefeld	2	3	4
Perquisites of court held there	0	16	8
	78	0	4

or nearly 80*l.*, or almost double the income of 1291. In 1557 the sum of 444*l.* 10*s.* 6*d.* was paid by Charles Fox for the site of the priory, with all the appurtenances in Bromefeld, Netherhalton, Ledwiche, Dinchoop, Hawford, Burweye, Cleyfelton, Ryefelton, and Whitbache. From Chas. Fox the estate at Bromfield passed by marriage to Matt. Herbert, whose descendant George, Earl of Powis, devised it to his nephew, the Hon. Henry Clive, whose descendant now inherits the estate.

Mr. Jasper More said that though the County Council's petition to have a geological survey of the county prepared seemed to have been refused by the Government, the latter informed him last week that they thought it a matter of great importance, their difficulty in having it done chiefly being as to who could draw up such an account. He (Mr. More) knew who could draw up the western portion and the coalfields, but they wanted to know who could write an account of the Ludlow district. He hoped and thought, considering the talented men in the district, if it were known, the neighbourhood would produce a man who could do the work.

The Excursions.

On Wednesday morning the party set out in rather threatening weather in carriages for Holgate, Abdon Burf and Burwarton. The route taken was by way of Stanton Lacy, Diddlebury and Corfham Castle to the Heath, with its Early Norman church, possessing flat buttresses at each angle, and in the middle of the north and south walls. There is a good doorway, an early font, and four very small windows in the east wall. The arrangement made was that members should leave the carriages at Abdon and rejoin them at Burwarton, proceeding in the meantime to ascend to Abdon Burf, 1,792 feet above the sea-level. Here are hut circles and other prehistoric remains in an oval area, 1,317 feet from north to south, and 660 feet from east to west, enclosed by a vallum 65 feet wide at the base. From Abdon Burf can be seen, about a mile to the west, Nordy Bank, a Roman station, in the shape of a parallelogram with rounded angles. A road led from here through Ludford and Hungerford, over Roman bank to Rushbury. After tea at Burwarton, the party returned to Ludlow.

On Thursday morning the visitors started, in brilliant weather, for Richard's Castle, where are the remains of an Early Norman fortress; the church also possesses several interesting features. A small party went off to examine the church of Ashford Carbonell, an edifice containing much Norman work. The east end of the church is lighted by two windows, having the ordinary plain Norman rounded heads; above these is a beautiful oval window, technically termed a vesica. This, if contemporary with the lower windows, would be one of the earliest instances of the appearance of the pointed arch in association with that with rounded head. Until the restoration of the church, about fifteen years ago, these windows were hidden by plaster, and it was only at that period that the original form of the windows was discovered. The two parties united at Orelton, where is another late Norman church, enlarged probably in the time of Edward I., as it is said that two beautifully carved corbel heads represent the king and his queen, Philippa. At Shobdon, the only old portion of the present church is the tower. About a century ago the owner of the ruins of Shobdon Priory carted away the remains of several arches, which had survived the destruction of the priory church. The central archway was probably the arch between the chancel and the nave, and the two side arches were, no doubt, doorways in different parts of the original building. Two tympana have been placed over openings between the central arch and arches on the right and left. The arches are of the most elaborate Romanesque character, the sculpture with which every portion of the arches is covered possessing certain features which seem more continental than English. These were pointed out in detail by Mr. Romilly Allen, and a few remarks upon the church were made by Canon Rupert Morris. Mr. Allen thought the subject of the eastern tympanum was the Redeemer in glory, according to the Apocalyptic vision of St. John. The subject of the second tympanum was more difficult of identification, the sculpture having become considerably weathered. He was inclined to think it represented the passage which spoke of our Lord during the three days after His crucifixion as having visited the lower regions and returned, "bearing captivity captive."

After lunch, which was partaken of at Mortimer's Cross, the site of the disastrous defeat of the Lancastrian forces by the Yorkists in 1461, the party moved on to Aymestry Church. Here they found a church consisting of a nave, chancel and nave aisles. Across the chancel arch runs a tall oaken screen of beautiful Perpendicular work, which is an evident insertion. The vicar, the Rev. J. Sidebotham, stated, on the authority of an old parishioner, that the screen was put into the church about the commencement of the present century, and that it had been brought from a church somewhere in the neighbourhood of Swansea or Neath. Colonel Morgan, of Swansea, observed that about a hundred years ago the old church of St. John at Swansea was taken down and replaced by a building in the poor taste of that period. It was well known that the old church was a fine edifice, containing some beautiful details, none of which had been perpetuated in the present church. The general opinion of the experts seemed to be that the

NOTES AND COMMENTS.

The qualifications of sanitary officers are as yet indefinite, and it is believed that much latitude is exercised by local authorities in appointing those officers. The Sanitary Institute has endeavoured to promote competency by means of lectures and examinations, but the possession of a certificate from the Institute is not always demanded by corporations. In a paper by Mr. MacMahon, of Torquay, which was read at the Dublin Congress, it was said that, as special training was necessary, a regular course of study and sanitary practice under an experienced inspector for a fixed period was the most likely method of preparing young men to be properly qualified to efficiently carry on the duties of the office which they aspired to obtain. It was suggested that well-educated youths of from eighteen to twenty years of age should be regularly articled for two years to a sanitary inspector in the town to which they would like to be appointed when competent. They should also study the various Acts of Parliament dealing with the subject. Mr. M'Mahon had trained a youth on those lines, and in eighteen months he passed the Institute examination, and in two and a half years won an appointment from over a hundred competitors under the Manchester City Council. Mr. Kenneth Cameron, of Aberdeen, considered there should be a course of practical instruction, to be followed by an examination by a central board, whose certificate of competency would be recognised and accepted by all. Candidates for the office of sanitary inspectors should be well recommended, and they should also possess the hall-mark qualifying them to undertake the work for which they offered themselves, and he thought the Institute should direct its efforts to the securing of such a central board as he had indicated. There should in addition be reasonable security for tenure of office as well as a superannuation scheme to provide for old age and retirement. The most effective manner for redressing these grievances was by co-operation among themselves, and he strongly recommended the Irish members to follow the example of Scotland by forming associations in several centres. If they did so they would succeed beyond their anticipations.

It was arranged that Mr. Thomas Drew, R.H.A, president of the Irish Institute of Architects, should read a paper on "The Prevention of Hideous Hoardings and Structures in Streets" before the Congress of the Institute of Public Health in Dublin. As Mr. Drew was unable to attend, Mr. Carton, Q.C., in the emergency, read a paper on the subject. He said that advertising stations were of recent origin, and were one of the most hideous and objectionable institutions of the time. They prevailed to a great extent in Dublin, and the advertising station, whether hoarding or otherwise, was unsightly in itself. He thought that the Corporation should be empowered to exercise supervision over advertising. Alderman Meade said he hoped that the Corporation would have control over public billposting, in order to exercise the same supervision that was exercised over certain pictures in shop windows. In regard to newspaper placards in the streets they had appealed to the Chief Commissioner of Police to prosecute in some test cases, but that gentleman replied that he had no power. It is to be regretted that Mr. Drew did not read his paper, for the subject is one that concerns architects more than other citizens, although the support of lawyers is desirable. Hoardings are not only hideous objects, but they diminish the value of the buildings which are near them. On that account the Property League should take up the question, for it is plain that the Corporation of Dublin, although possessed of much power over the streets, dare not interfere with a hoarding or anything hideous upon it.

One of the best proofs of the efficiency of the instruction in the Glasgow School of Art is found in the number of appointments obtained by the students. During the last session there were recommended a professor of design and decoration, a head-master of an art school, five assistant architects, three decorative artists, two designers and a mechanical draughtsman. Among the students of the last session 79 were described as architects, 140 as designers' draughtsmen and litho artists. Out of 618 only 88 were said to be "art students." The figures will suggest that the majority of those who attend the class have in view the improvement of their skill in business. The staff is numerous. The architectural department is under the direction of Mr. W. J. Anderson, the author of a book on "Italian Renaissance Architecture." By desire of the Governors he will deliver a corresponding course on "The Architecture of the Renaissance in France" during the winter term, having visited France for the purpose. The subjects taught in the architectural classes are building construction, specifications and quantities, drawing, sketching, measurement, ornament, colour decoration, design, perspective and sciography. There are several bursaries and studentships attached to the art school.

During a quarter of a century M. Pascal has been professor of architecture in connection with the Ecole des Beaux-Arts. A great many architects have completed their academic treatment under his supervision, and among others several winners of the Prix de Rome. So interesting an occasion could not be allowed in Paris to pass by without the creation of some artistic memorial. Accordingly M. Pascal's past and present pupils decided to give a commission to M. Chaplain, the medallist, for a plaquette which should bear a portrait of the master. The effigy is a faithful likeness, which has received the commendation of the architect's friends. On the reverse is an oak, which is illuminated by the rays of a sun that rises behind a dome resembling St. Peter's, with the legend, "Abrités par son ombre et nourris de sa sève."

* * *

It is remarkable to find such grave authorities as those who have charge of the Ecole des Beaux-Arts and of the Académie de Medecine at loggerheads on a question of light and air. In order to erect a palace more worthy of the Académie than the existing building in the Rue des Saints-Pères, property has been purchased which in part adjoins the court of the Ecole. The Conseil des Bâtiments Civils naturally wish to preserve as much light and air for the court as can be secured, and therefore have demanded that the building must be at least 3 metres or about 10 feet distant from the boundary wall. In order to avoid a rupture three different plans have been prepared, but as yet they have failed to secure approval. On behalf of the Académie it is maintained that the ownership of the property acquired gives the right to use the wall of the court as a party wall, and over that point the battle will be fought if necessary. The case has been submitted to M. Liard, director of education, and his judgment may not be given for some time.

The demolition of the Mazas prison of Paris for a moment gave rise to speculations about the interest which the stones would have for collectors. French archæologists are not disposed to contest for treasures of the kind, and the Americans displayed no ambition to carry specimens back to Chicago. A very few memorials of the prison have been secured. The stones have no chance of preferment or liberty. It has been decided to use them in the new sewers of Paris, and from a prison above ground they will be transferred to one which will be far beneath the traffic of the Rue de Rivoli.

After rendering services during more than thirty years, Hurst's "Handbook for Architectural Surveyors" (E. & F. N. Spon) stands in need of no commendation. Few professional books have reached a fifteenth edition so quickly. Little that is new about architecture remains to be expressed in formulæ. But for that reason when a subject so important as electric lighting is to the fore, it deserves to be noticed. Why should it be omitted when so many memoranda are printed about gas?

THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

(*Continued from page* 135.)

balance of evidence was in favour of the Aymestry screen having come from St. John's juxta Swansea. If this hypothesis can be verified the visit of the Cambrian archæologists to the churches in this part of Shropshire will have had valuable results, and the identification should, at any rate, be attempted.

The members next proceeded to Wigmore Church, a large edifice built in Norman times, but almost entirely remodelled in the Decorated period. The castle is a strong post, erected by one of the first members of the Mortimer family, but it has been so effectually dismantled that it is not easy to make out its ancient features. It seems to have consisted of three wards, and, with the exception of one Norman tower and part of the adjoining curtain wall, to have been rebuilt in the Decorated style in the earlier part of the fourteenth century by Roger, eighth Lord Mortimer and first Earl of March.

The annual meeting of the Association was held in the evening, and a large increase of members was announced. Sir Owen Scourfield, the retiring president, was elected a vice-president, and the various officers and members of the committee were re-elected. An invitation from the Royal Society of Antiquaries of Ireland, to join in a marine excursion to the Celtic districts and islands on the western side of Scotland during the summer of 1899, was cordially accepted, though considerable feeling was manifested at first in favour of a meeting at Merthyr Tydvil, which has never been visited by the Association.

Friday's excursion began at nine o'clock with a drive through the president's (Lord Windsor) park of Oakley, passing by a decaying group of trees known as the Druidical oaks. A short walk brought the antiquaries to the church of Bromfield, once the conventual church of the priory of that name. This was described by the vicar, the Rev. W. Selwyn, a son of the late Bishop Selwyn, and his son-in-law, the Rev. Clarke Maxwell, vicar of Clunbury. The church contains traces of Norman work, especially at the east end, but it is in the main a fine example of Early English. The chancel has a curved ceiling, painted in the extravagant manner of the seventeenth century, the result of a restoration which took place in 1658. In the dark days of the Hanoverian dynasty the beautiful features of the early work were hidden beneath a covering of plaster and whitewash, and it was left to a later restoration, largely due to Lord Windsor's munificence, to make manifest the original characteristics of the fabric. His lordship, with whom were the Hon. the Misses Windsor-Clive, met the party at the entrance to the Oakley demesne, and accompanied it until its departure from Bromfield. In the church his lordship expressed his thanks to the Society for having explained the historical and architectural merits of the church.

The next halt was at Leintwardine, the supposed site of the Roman station of Bravinium. The plan of the castrum is said to have been satisfactorily made out, but it at present leaves much to the imagination. The church is reported to be partially built upon the walls of the Roman camp, and the difference of elevation between the nave and the chancel gives colour to the suggestion. It is a large building, having, in addition to the manifold changes that befel almost all ecclesiastical edifices during the Mediæval period, undergone a somewhat drastic restoration within the last forty years. It consists of a nave, a chancel reached from the nave by five steps, and northern nave and chancel aisles. The west tower is a massive structure of no particular architectural distinction. At the west end is a closed Norman doorway, which gives the period of the foundation of the church. The east window is new and (either it or its predecessor) has been lowered, a splendid Late Decorated reredos being removed, and only the ends are left to testify to the extraordinary absence of taste that characterised the times. A remarkable feature of the north side windows is that they are turned inside out, as, so Mr. Stephen Williams stated, is the case in the parish church of Llanidloes, the explanation of this, he added, being that it was the work of some country masons, who did not know what they were actually doing. The screen is not unlike the one in Montgomery parish church, and, as it was believed that the latter came from Chirbury Priory, there was good reason to believe, continued Mr. Williams, that the screen at Leintwardine formerly belonged to Wigmore Abbey.

The party divided after luncheon, a carriage full driving to inspect the remains of Wigmore Abbey, where they made some interesting discoveries, which were dealt with at the evening meeting by Mr. Stephen Williams and Archdeacon Thomas. The larger portion of the party proceeded to Brampton Brian Church, which consists of a single chamber without structural division between chancel and nave. It looks for all the world like the banqueting-hall of a castle which has been adapted to sacred purposes. The visitors, however, were informed by one of the churchwardens that the fine oak roof once covered the banqueting-hall of the now ruined castle, the remains of which adjoin the church. The roof is a splendid specimen of the hammer-beam variety, the oak pilasters, which rest upon wooden bases, having Classic details. There is an early effigy of a lady, probably of the reign of Edward III., which has come from an earlier church destroyed by fire in 1644. The registers of the church are fine specimens, and on examination one was found to contain a license by the rector of the parish to Dame Brilliana, giving her permission to eat flesh on fish days by reason of her great weakness and ill-health; this to be continued till it should please God to restore her health. The date of the license is March 1652. The castle was a small building, and though originally constructed in the time of the first Edward, became of more domestic character in the reign of his grandson, when many beautiful details were added. Alterations were made in Tudor times, and soon afterwards it was deserted for a more prosaic, but probably more comfortable dwelling. The modern residence of the Harleys—over whch the party were kindly conducted by the Hon. Mrs. Harley, a descendant of Lord Rodney—contains much of the spoils of the ancient castle, and evidences of the stern struggles of our ancestors in the shape of Cromwellian armour, man and wolf traps, and diabolical engines called "branks," used for branding wandering villains upon the cheek, and much different to the scold's bridles seen at the recent exhibition of Shropshire antiquities. Amongst the portraits is one of Sir Harry Vaughan, one of the Vaughans of Hergest Court, where was deposited the celebrated manuscript known as the Red Book of Hergest. The portrait bears the following motto:—"Remember them that wache and ward for you their prince and realme and suche as doo wythe bludy swets ofte tymes deserve to gayne. MDLX."

Next came a stiff climb to the summit of Coxwall Knoll, where the last fight of Caractacus was fought over again. After inspecting Bucknell Church the party bade good-bye to the brakes and took train for Craven Arms, *en route* for Stokesay, where is one of the finest examples in England of a castellated mansion of the thirteenth century, a description of which was given at the evening meeting, reported below.

A public meeting was held in Ludlow Town Hall on Friday evening for the reading of papers on local antiquities and history. In the unavoidable absence of the president, Lord Windsor, the chair was taken by Mr. Lloyd Philipps, one of the vice-presidents of the Society.

Stokesay Castle and Church.

The Rev. J. D. La Touche, rector of Stokesay, in an interesting paper on Stokesay, which was read by Mr. Llewelyn Jones, after giving a detailed history of the castle, called attention to what he considered a few points of special interest, upon which the opinion of archæologists would be of value. The gate-house, he said, would at once be pronounced as of the Elizabethan age. Yet, he asked, was there not some difficulty in supposing it to have been standing when in 1645 the castle was about to be stormed, for it could then have offered no effective resistance to the attacking party. Was it possible that it dated from the time when the castle was attacked? He also called attention to the grooving of the mullions or transoms of the windows. He had seen an exactly similar grooving in two other places, Haughmond Abbey and an old house at Brinsop in Herefordshire. His third point was with regard to the octagon of stones in the great hall on which the brazier stood, the beams of the roof above, blackened by the smoke which curled up from the fire which filled it, being worthy of remark, as were also some traces of fresco ornamentation in the basement of the north tower. Continuing, he said the church, which stood near the castle, although of plain and homely appearance, possessed many points of interest. An arch inside between the nave and the tower appeared to be of fifteenth-century date, but expert opinion on the point, he said, would be of value. During the Civil Wars the building was certainly injured. On one occasion some Royalist troops, with their horses, took refuge in it, and the tradition in the parish was that the roof was set on fire from the castle, which was then in the possession of the Parliamentarians. The round-headed windows in the south wall of the nave must have been inserted after this event. The keystone of the arch above referred to informed them that the restoration took place in 1654. The canopied pews in the chancel gave the interior a quaint and picturesque appearance, but what their date might be was a subject of speculation. On the walls in several places appropriate texts and the Creed and Ten Commandments in antique characters had recently been discovered under a thick coating of whitewash, also two life-sized figures representing doubtless Moses and Aaron. These were in process of restoration.

A vote of thanks was accorded Mr. La Touche for his paper.

Wigmore Abbey.

Mr. Stephen Williams next described the result of a visit by some members of the Society to Wigmore Abbey that day. It was many years since he last visited the abbey. At that time there was a large tithe barn in existence, which had since been destroyed by fire, but that fire did not destroy all the remains of Wigmore Abbey, and there was much which had not yet been swept away from the face of the earth. In the "Archæologia Cambrensis" was an article with reference to the building, and they discovered that day some of the beautiful work mentioned in the article, together with several excellent specimens of mouldings, in addition to some Early English mouldings. They also found the windows and a seat from inside the abbot's house. On the north side of the wall they found windows of early date, while they were also able to locate the position of the cloisters. He did not wish to say that Wigmore offered facilities for excavation, as the site of the abbey was now covered with farmyards. He, however, suggested that local archæologists should make a few diggings here and there in order to define the shape of the abbey. They were glad that they went there, and he hoped the information he had given them was sufficient to show that the whole of the great abbey had not been done away with.

Archdeacon Thomas, referring to Mr. Williams's last suggestion, pointed out that the ground showed that there had been a great number of haphazard diggings, which had not been done in a systematic way. He thought the best thing to do would be to dig a number of trenches so as to intercept the extended line of the chancel. By so doing they would come to the foundation walls, and when once the foundation walls were found it would be an easy matter to follow them out.

The Vallum of Bravinium.

Referring to another part of the day's excursion, Archdeacon Thomas mentioned that immediately after luncheon some of them were taken to the north-west corner of the vallum of Bravinium. It was well defined, and they followed it eastwards, a little more than parallel with the east wall of the church, which was represented on a plan by Dr. Bull as the eastern vallum of the station. A slope in the ground at that place also supported such a theory, but not being quite satisfied they continued in the same line for some distance further. Crossing the famous Watling Street, and turning southwards, where they imagined the line might be, they found themselves on a slightly raised bank just outside the hedge. After a while they lost sight of the vallum, owing probably to its having been cultivated away. They, however, continued their search along the line, and on crossing the hedge they at once found themselves upon a continuation of the vallum. This they followed till they came to an angle turning westwards, which satisfied them that they had discovered the angle on the true eastern side of the station.

Mr. Fortey, curator of the Ludlow Museum, who assisted Dr. Bull in the preparation of his plan of the vallum, expressed himself satisfied with the archdeacon's statement.

Mr. Glascodine (Swansea) asked the Archdeacon whether what he had said was not an argument against the new theory that the Roman road passed through instead of passing on the side of the station. His opinion was that Roman roads did not pass through, but by the side of stations.

Archdeacon Thomas, replying, said it was really an argument in favour of the wider area—that the Roman road should pass through the centre.

Mr. Stephen Williams supported the Archdeacon's argument by quoting the case of Silchester, which the Society of Antiquaries had recently been exploring, where the Roman roads did pass through the centre.

The discussion then dropped.

Mr. Romilly Allen afterwards described some of the architectural features noted by him in the course of the excursions.

Black and White Timbered Houses in Ludlow.

Mr. A. W. Weyman, in the course of a short paper on this subject, said many of their old houses had been altered or rebuilt from time to time, as the necessities of a busier and changing age had compelled, and few, if any, remained in the state they were in some hundred years ago or so. As an instance Mr. Weyman mentioned the beautiful old house in Castle Street, which was restored to its former state by one of their ex-mayors, the late Mr. Thomas Roberts. He also referred to the beautiful old windows which had within the past few months been opened in the Feathers Hotel, which were so long covered up and forgotten. Continuing, Mr. Weyman remarked that without doubt the builders of every generation had left for good or ill the largest mark upon the centuries, and it was to them that archæological associations were so greatly indebted for assistance in building up the remains of a bygone age, and in again showing them in their former condition. He gave the following list of old black and white timbered houses visited by members of the Association during the week:—Shop at present occupied by Miss Howells in Broad Street, Reader's house in Churchyard, Feathers Hotel, house in Durhain at present occupied by Mr. Chester, house in Castle Street at present occupied by Mr. Sharpe, the Conservative Club, house adjoining Mr. Butler's, the Cross and Lane's Asylum. These specimens of architecture, he said, in addition to a number of others, were well worthy of record, and would, he thought, show that Ludlow had many rich specimens valuable alike to the archæologist and the artist.

The proceedings concluded with the customary votes of thanks.

We are indebted to the *Border Counties Advertiser* for the excellent report of the meeting.

THE FRANKS BEQUEST.

THE late Sir A. W. Franks entered the service of the Trustees of the British Museum in 1851, and held the office of keeper of the department of British and Mediæval Antiquities and Ethnography from 1866 to 1896, when he resigned. In 1892 he was elected President of the Society of Antiquaries, and thus became also an official trustee of the British Museum. By his death the Museum has become possessed of one of the most important bequests of modern times, which was, however, only the conclusion of a long series of benefactions, Sir A. W. Franks having from his earliest connection with the Museum periodically made valuable gifts to the trustees of objects of interest not only to his own department, but also to other departments of the British Museum. The objects in the bequest may be summarised as follows:—

1. A collection of finger-rings of all ages and countries, numbering about 3,300. 2. A large number of examples of ancient, Mediæval and more modern goldsmith's work and jewellery. 3. A collection of drinking-vessels of various materials and of all ages, but chiefly Mediæval and later. 4. A collection of porcelain manufactured on the Continent, numbering 512 specimens. 5. A collection of Japanese ivory (*netsuké*), about 1,500 in number. 6. A collection of Japanese sword guards, about 850 in number. 7. A very large collection of book-plates (*ex-libris*), trade cards, tickets, &c. 8. Books on pottery and porcelain, for the library of the department. 9. In addition to the foregoing specific bequests the trustees were empowered to select, from among the other works of art or curiosities, any that would be of value to the Museum. So extensive a series of collections obviously cannot be here dealt with in any detail, but it may be of use to indicate the character of, or the principal objects in the various sections.

1. *Finger-rings.*

This collection occupied many years in its formation and contains rings of all periods. The classical series is very rich, including fine Greek rings, several of the first importance of Roman times, *e.g.* those from the Treasure of Tarsus, and others of the same massive kind of the first half of the third century; a Christian marriage ring inscribed ACCIPE DULCIS MULTIS ANNIS, and a fine ring with the shoulders modelled in the form of figures of Atys. Among the Saxon and Byzantine rings the most remarkable, and probably the most important in the whole collection is the ring of Æthelswitha, Queen of the Mercians and sister of Alfred the Great. It is not a little remarkable that this ring will now be shown by the side of the ring of the father of both, Æthelwulf, which has been in the Museum for many years. Among the rings of more modern date the following are worthy of mention, viz. a series of twelve of the so-called Papal rings, the large devotional ring with the "Five Wells" known as the "Coventry ring," a rich series of signet rings, including one of a Courtney, a number of Hebrew betrothal rings, a collection of mourning rings extending over about two centuries, a large number of wedding rings with mottoes or posies and a long series of ancient Javanese and other Oriental rings.

2. *Goldsmith's Work and Jewellery.*

This section includes a large quantity of jewellery and other objects in the precious metals, many of them of classical times, but with the exception of the "Treasure of the Oxus," the greater part is of Mediæval and later times.

The "Treasure of the Oxus" is without doubt the most important part of this section from the archæological point of view. It consists of a large number of utensils and works of art, chiefly in gold, which have been sent to England from the N.-W. Frontier during a certain number of years past, and it includes also a similar collection formed in India by the late Sir Alexander Cunningham, by whom it was ceded to Sir Wollaston Franks.

As works of art the most important are a large gold armlet with two gryphons in full relief, their wings once set with pastes or stones; the remains of a dagger sheath with hunting scenes in low relief in Persepolitan style; two discs, one in gold the other in silver, with designs of a similar character; a gold jug,

the handle terminating in a lion's head; and a model of a king in his chariot, in gold.

The principal piece of historical interest is the gold signet of a Persian king of about 350 B.C., whose name has been read as Phahaspes. The treasure contains a very large number of objects, armlets, thin gold plates with figures of Persian warriors, as well as many smaller articles of adornment.

Among the classical jewellery may be mentioned two shoulder ornaments of gold from the Fould collection, with Etruscan designs in granular work; a large series of jewellery, earrings, &c., from Crete; two small gold bells, from the Treasure of Tarsus in Cilicia, with the labours of Hercules; and a number of articles of Roman date found in Egypt.

Of post-classical times the representation is fully as great. It includes a find of gold ornaments of the Lombard time from the north of Italy, a limited series of Byzantine objects, a number of Mediæval brooches with devices and mottoes, a remarkable set of fifteenth-century jewels found in the Meuse, a hoard of silver ornaments of Italian work found in the castle of Chalcis in Eubœa; pendants and earrings in the form of ships of Venetian work; the gold covers of a small devotional book, enamelled and of English work, temp. Henry VIII.; several fine cinque-cento jewels, spoons, enamelled miniature portraits, &c.

3. *Drinking Vessels.*

This collection has been on loan and exhibited in the Gold Ornament Room for some years. It consists of more than 150 cups and other drinking vessels formed of gold, silver, wood, crystal and a variety of other materials.

Among the most remarkable and important are the following:—A hoard of silver vessels of doubtful date but of somewhat classical style from Van in Armenia; a series of Roman silver bowls, spoons, &c., some of them with Christian symbols, found with articles of jewellery on the Hill of St. Louis, Carthage; dishes, &c., of Sassanian work, one of them with a figure of Sapor II.; a Saxon silver bowl found in Lancashire full of coins of Canute; an Arab crystal cup of the thirteenth century in Flemish silver mount of the fourteenth; several mazer bowls, including the Rochester mazer and the mazer with enamelled mounts of Louis de Male, last Count of Flanders; glass jug with silver mounts with the arms of the great Lord Burghley; and a remarkable globe cup with a map of the world after Oronce Finé.

4. *Continental Porcelain.*

This collection consists of 512 specimens, representing most of the factories of Europe. It is especially valuable for the great number of marked pieces, some of them of great rarity, and the collection is for this reason of especial value for the history of the various factories. The whole is now on loan to the Science and Art Department, and is exhibited at the Bethnal Green Museum. A catalogue, written by Sir Wollaston Franks, has been printed by the department. There is at present no room at the British Museum for the display of the collection.

5. *Japanese Ivory Carvings.*

This large and important series has been on loan and exhibited at the Museum for some years past; it consists of about 1,500 of the small carvings known as *netsuké*. This collection is of especial value for several reasons; it includes examples of most, if not all, of the best known artists in this style of Japan, and further it gives an unusually complete representation of the manners and customs, the legends, folk-lore and ordinary occupation and dress of the Japanese, all on a conveniently small scale.

6. *Japanese Sword Guards.*

This collection numbers about 850 pieces. Its interest is of much the same character as that of the foregoing section, the subjects being of a similar kind, although the warlike element is somewhat more prominent. In addition the various metals employed show the extraordinary skill of the Japanese in alloying and otherwise treating metals in an artistic manner.

7. *Book Plates, Trade Cards, &c.*

This very large series is in the department of Prints and Drawings.

8. *Books on Pottery and Porcelain.*

This portion of the bequest comprises about 370 works on the subject, and forms a most useful addition to the library of the department. Several of the works are of some considerable value, but the great importance of the bequest is that the department now possesses what was practically the working library of Sir Wollaston Franks, on a subject in which he took the keenest interest.

9. *Selections.*

The somewhat difficult task of selecting from among the very numerous collections not specifically bequeathed was much simplified by the fact that Sir Wollaston Franks had, during his lifetime, already presented nearly all the objects that he thought worthy of being placed in the Museum collections. The selection that has been made comprises a number of additions to the continental porcelain which Sir Wollaston Franks had bought since the catalogue was printed; a few examples of Oriental and other wares; a few specimens of glass and of Japanese lacquer; a number of enamelled portrait miniatures, as well as charms and other curious objects. In making this selection the trustees had the valuable aid of one of their number, Mr. Drury Fortnum, whose great knowledge of works of art and long friendship with Sir Wollaston Franks made his help of exceptional value.

It is proposed that, for a time, at any rate, the principal collections of Sir Wollaston Franks shall form a separate exhibition in the Museum. Catalogues of some of the sections are in progress, and will appear from time to time. It is felt that the publication of such catalogues is a better recognition of the importance of the bequest than a permanent separation of the objects bequeathed from others in the Museum of which they are in many cases the complement.

The foregoing summary account gives an idea of the extraordinary extent and importance of the accessions to the Museum under the will of one of the greatest benefactors that it has ever known. To the devotion of a lifetime, in which almost every hour was given to the service of the Museum, Sir Wollaston Franks, by this munificent bequest, added to his constant benefactions up to the day of his death, has raised to himself a monument which will equal the great reputation he enjoyed during his life.

SANITATION IN IRELAND.

IN the Engineering and Building Construction Section of the Congress of the Institute of Public Health in Dublin, Mr. Charles P. Cotton, chief engineering inspector of the Local Government Board, presided.

Before delivering his presidential address he mentioned that he was asked to preside in the absence of Sir T. Newenham Deane, who, they regretted, had been unable to accept the position of president of the section. It appeared to him (Mr. Cotton) that sanitation, as regards "building construction" and "the house" had been brought theoretically as near perfection as might be. In speaking of recent sanitary legislation he meant to refer to the period since the passing of the Public Health Act of 1875, followed by the Public Health (Ireland) Act, 1878. It was left for the last-mentioned Act to sweep away all existing legislation on the subject in this country and to make a fresh start by re-enacting the most useful parts of the previous Acts with amendments. Having dealt with various measures which were passed on the subject of public health he pointed out that the power of making by-laws respecting new buildings, &c., was confined in England to urban authorities, but by Section 41 of the Irish Act such by-laws could also be made by any rural sanitary authority. The importance of that was evident when it was considered how many towns in Ireland were as regards sanitary matters under the jurisdiction of rural authorities such as Omagh, Strabane, Dungannon, Castlebar, Mullingar and others. He regretted that this most useful provision was not more generally availed of by the rural authorities. Indeed, he doubted that many of them were aware that they possessed such powers. The Open Spaces Act, 1887, gave great facilities to sanitary authorities to provide open spaces for the use of the inhabitants of the respective sanitary districts for exercise and recreation. The Labourers (Ireland) Act for providing improved house accommodation for the labouring classes has been in operation since 1884. The number of houses definitely authorised since that time had been 15,748, and loans to the amount of 1,909,311*l.* had been sanctioned for their erection, and over 13,000 had been completed and were tenanted. At least three rooms—a living room and two bedrooms—were required in each house, together with proper sanitary accommodation, the average rent being 1*s.* a week for the house and half an acre of land. These dwellings induced habits of neatness and comfort, and must be attended also with a general improvement in health. Previous to 1878 waterworks for the supply of the larger districts—Dublin, Belfast, Londonderry, Cork, Limerick and Waterford—had been constructed under local Acts, but since that time it had been found necessary to increase these supplies, not so much from increase of population—except in the case of Belfast—as from increased consumption per head. Having given descriptions of these water supplies, he went on to say that a sewerage system of considerable magnitude was now being carried out in the city of Dublin. Hitherto the internal drainage had been all discharged into the river Liffey along its entire length through the city. The Corporation were now carrying an intercepting sewer along each side of the river, the contents of which would be taken to precipitation tanks at the Pigeon House Fort,

whence it would be conveyed out by specially-constructed vessels, and discharged in the sea. A Royal Commission had, as they were aware, been appointed to inquire into and report upon the methods of disposing of sewage, and make any recommendations that might be considered advisable. The Housing of the Working Classes Act swept away all previous legislation on the subject, and replaced it with a concise code dealing with the clearing of unhealthy areas in towns and the erection of dwelling-houses for the working classes. It might be expected perhaps that he should say something of the new order of things in connection with public health under the Local Government Act, 1898, when it came into operation. He had not studied the measure closely, but he understood that beyond the changes of designation and constitutions of the local authorities there would be absolutely no alteration in the procedure for carrying out structural works under the sanitary laws.

Mr. W. Kaye Parry proposed a vote of thanks to Mr. Cotton for his address. He said that the most important Royal Commission that had sat for a long time, as far as civil engineers were concerned, was the Commission dealing with the question of sewage purification. They were gratified to have Mr. Cotton as their representative on that Commission. They knew that his presence would be an element of strength, justice and impartiality on the Commission.

Mr. Ryan seconded the motion, which was carried.

The President expressed his thanks for the compliment paid him, particularly at a time when he was retiring from his present position.

Mr. Frank Leslie Watson read a paper on "The Designing and Construction of Refuse Destructors."

The President said the working of the destructor in the township of Pembroke would be watched with interest by the authorities of all the towns in Ireland.

Mr. Leslie Watson, in reply to some questions put by members present, said he had never heard of the smallest objection being made by the inhabitants of towns in which the Horsfall destructor was at work in consequence of the smoke emitted.

Mr. Edward Magennis, M.D., read a paper on "Hidden Dangers in the Sites of Dwelling-houses."

Mr. James Dillon read a paper on the "Subsoil in Relation to Sites for Dwellings." He said the Local Government Board for Ireland and their able officers, including their President, had rendered valuable services to the people of this country, pointing out to them their present defective sanitary conditions, while at the same time assisting them to obtain loans on easy terms for sanitary work. Parliament having sanctioned that year a new Local Government Act for Ireland, they must all hope that each district council and county council would try without delay to carry out the suggestions of the Local Government Board in the directions indicated, as they would have ample legal powers to do so.

THE ROYAL DUBLIN SOCIETY.

IN letters of gold over the portals of the Royal Dublin Society's premises, says the *Irish Times*, should be written the names of Thomas Prior and Samuel Madden. The pioneers of an institution such as this, which for 167 years has encouraged and fostered every attempt for the improvement of the arts and industries of the country, are worthy of the highest honour. To go back to the year 1731, when several gentlemen, including the two above named, held their first meeting on June 25, and decided to found a Society having for its object the promotion and improvement of anything or everything that could be raised or made or manufactured in Ireland, brings us to a period when things were very different to what they are to-day. The great impetus that the various crafts have received from the holding of international and local exhibitions, and the attention publicly drawn to the great benefits to be derived therefrom has caused private aid or encouragement in such matters to be almost unnecessary now, but at the time of which we speak personal and particular patronage was an essential element in furthering every project, and it was only the extreme energy and perseverance of the first founders of the Dublin Society that brought them through the many difficulties and disappointments that came in their way. Fourteen members joined at the first meeting, and for many years the principal effort made in furthering the movement was in offering prizes for new inventions or improvements in any useful art or manufacture. They also published a paper dealing with observations on "Agriculture, Brewing and Flax Husbandry." Land was also taken near Dublin where experiments in farming were carried on, and premiums were offered for the encouragement of the fine arts. The aim and scope of the Society was to include every article that, by improved manufacture, would add to the wealth of the maker and the good of the community. Prizes were bestowed on those persons who produced the best flax, cider, earthenware, lace, thread or hops. Sculpture, painting, needlework, curing fish and making paper all obtained recognition at the hands of this wonderful Society, and for the first fifteen years of its existence it carried on its work solely by the efforts of its members. In 1745 an application was made to the Government for an annual grant of 500*l.*, and the Viceroy, Lord Chesterfield, having recognised the importance of the work the Society was doing, supported the request, which was granted. To trace the labours of the Society and the results to which they have led would occupy too much space; but when we remember that a number of the public institutions in our city, which are generally founded by the State, owe their origin in this case to it, the citizens of Dublin are under deep obligations to those bygone members and workers who were the means of obtaining for them such advantages. The Royal Dublin Society can claim the credit of founding the Science and Art Museum, the National Library and the Metropolitan School of Art. For many years the only effort made in connection with such studies was done through the Society, and at a time when, with limited accommodation, the annals of the Society point to an increasing perseverance on the part of the first promoters to carry on the good work begun in spite of every drawback. Parliament was petitioned for further funds "to enable the Society in a more ample manner to promote and encourage agriculture, arts and manufactures." The early members met where they could, sometimes in rooms in Trinity College, sometimes in the Parliament House, and the first collection of models or specimens was stored in one of the vaults of the Irish House of Commons, awaiting more fitting premises. It was in 1815 that the Dublin Society finally settled down in Leinster House, but before that they had many changes, being first in Shaw's Court, where they took a large dwelling-house in 1757. They removed to Grafton Street later, and afterwards on the site of the present Theatre Royal occupied a splendid building, which they had erected and used for fourteen years. In the early years of this century the Society founded the Botanic Gardens at Glasnevin, which, with the other institutions named, have since been handed over to the care of the State. The National Gallery and the Royal College of Science are also both outcomes of work begun by the Royal Dublin Society. To enumerate the variety of ways in which the Society has worked and the great number of objects it has assisted would be impossible in a short notice like this, but it is simply amazing to look back on the vast amount of work it has accomplished, to estimate the good it has done, and the benefit it has conferred can never be known. The refining influence it has exercised can hardly be recognised, so quietly and gradual has been its working; but that a semi-private enterprise should have such far-reaching results is an astonishing fact.

ADVANCED INSTRUCTION FOR DRAUGHTSMEN.

AN address was lately delivered by Professor W. R. Ware to the members of the Architectural League on their visit to the School of Architecture of Columbia University. It describes some innovations in the usual course of instruction which could be followed with advantage elsewhere. The following report is taken from the *American Architect*:—

It is an open question in a school of architecture, as it is in a university, and in every place of education where the students are somewhat mature, what is the best system of study. It is not clear whether such students are best served by a fixed curriculum, in which prescribed studies are taken up in a prescribed order and pursued for a given term of years, as is the case in our American colleges, and in the Gymnasia of Germany, the colleges and lycées of France and the public schools of England, and in technical and professional schools almost everywhere, or whether advanced studies, including technical and professional subjects, cannot be followed to better advantage under a freer system, such as is found in the German universities and in the Ecole des Beaux-Arts in Paris, a system under which every student studies what he pleases, when he pleases, as he pleases, taking up whatever he likes best or finds he is best fitted for in whatever order he will.

But this is a controversy in which we ourselves have not been obliged to take part. The question has been settled for us, and settled in the happiest way. Starting seventeen years ago as a department of the School of Mines, we necessarily came under the rules of that school, and the first thing to do was to frame a four-years' course of study conformable to the courses previously existing. This four-years' course still obtains, though it has been so much changed as almost to have lost its identity. All the subjects formerly shared with the other departments either have been taken into our own hands, such as the mathematics, mechanics and engineering, or, like physics, chemistry, geology and botany, have been

discontinued altogether. Our students have to study the elements of physics and chemistry before they come to us, and this suffices to give them the general notions, which are all that an architect has occasion for. The time formerly given to these studies is now more profitably spent upon a course in building materials specially devised to meet the scientific needs of our own students, into which is incorporated such further scientific instruction as is needful. For this we draw freely upon our neighbours, and thus, thanks to their friendly co-operation, profit quite as much by our scientific environment as when we were an integral portion of the School of Mines. The lectures and recitations, moreover, have been concentrated in the first three years, leaving the fourth year almost entirely free for what is virtually post-graduate work. But it is still a four-years' course, and though some men manage to accomplish it in three years and others give five to it, it still presents a definite curriculum, a prescribed path leading to our degree.

Whether or not such a definite line of work is really best for professional schools as distinguished from schools of liberal culture, there seems no doubt that it is best for young men who are still in a state of pupilage.

Meanwhile, however, there has sprung up alongside of it the freer system of study. We do not indeed receive young men of the age and standing of our regular students, except into the regular course. The statutes expressly declare that "special students are not desired, though men of maturity are sometimes received as such for reasons of weight." But if a man has been a professional draughtsman for three or four years this is generally found to be a sufficiently weighty reason for accepting him as a special student, and in the last half-dozen years nearly a hundred such have been on our books. These men study what they please in whatever order they choose. Thus we have the two systems working harmoniously together side by side, each serving its own men better than the other could do.

These draughtsmen are received on exceptionally favourable conditions both as to fees and as to the period of their attendance. They pay thirty dollars for each two months. This entitles them to instruction in the draughting-room and to four hours a week of recitations and lectures. Draughtsmen who are temporarily out of work can accordingly drop into the school at almost any moment and take part in whatever they are qualified to take part in. In the German universities and in the Ecole des Beaux-Arts there is not only freedom of study but also freedom of teaching. Almost anybody can get leave to take part in the instruction. There have accordingly grown up in Paris, outside the Ecole itself, a considerable number of private *ateliers*, in which the ablest architects in France give the students the incomparable benefit of their personal counsel, and a number of circumstances happily combine to make this scheme the most triumphantly successful scheme of architectural instruction that the world can show. The backbone of the system is the French Academy at Rome and the annual bestowal of the Grand Prix leading to it. This in turn leads to Government employment when the students return to France. The promise of a prosperous career attracts to the school a company of able candidates who year after year frequent the *ateliers* in the character of *anciens*, and the presence of these mature and skilful men gives to the work of the school a character and quality nowhere else to be found.

All these favourable conditions are obviously exceptional and local, and they cannot be expected to repeat themselves elsewhere, least of all in this country. Even if Government patronage and the promise of Government employment kept men year after year at their studies, the conditions of professional practice in this country are so unlike what they are in France that it would be impossible for the men at the head of the profession to take an active and responsible part in directing them.

But the repeated testimony of the men who have profited most by what the Ecole des Beaux-Arts has to offer seems to show that it is to this unique opportunity of intercourse with able men that its paramount excellence is due. The emulation, the *camaraderie*, the honours and the prizes are picturesque and profitable circumstances, but they may be dispensed with, and in other places other customs and influences may produce equally good results. But this opportunity for personal guidance is not elsewhere to be had. Men must go, and must probably long continue to go to Paris in order to enjoy it.

This advantage a school like our own cannot possess. It must be carried on not by exceptional men occupying conspicuous positions in the ranks of the profession, but by ordinary persons like ourselves, fairly intelligent and well-informed, but who, however devoted and faithful, are nothing out of the common. In this case it would be easy for us, like the fox in the fable, to disparage the fruit we cannot reach, and to point out that it is only the men that are exceptionally far advanced in their studies who really enjoy these exceptional advantages in any great degree. We might even maintain that an overpowering personal influence is likely to do as much harm as good, and that the most famous masters have seldom turned out famous pupils. They stimulate imitation, not originality. But it is more to the purpose to consider that, this source of influence being closed to us, we are the more concerned to make the most of the more humble appliances within our grasp, and to strive by perfecting our system and methods to make up for the lack of such personal inspiration.

It is to our continued efforts in this direction that are due the radical modifications in our curriculum that have already been mentioned, and in all these changes we have been guided by two or three considerations to which we have come to attach special value. In the first place, we have tried to arrange it so that the different branches of instruction that are going on at the same time may co-operate with one another to enforce the same points, and we find it practicable, with a little management, to make the history, the ornament, the design, the freehand drawing, the perspective, and sometimes even the descriptive geometry and the shades and shadows, all illustrate one another and combine to illuminate the same subject-matter.

In the next place, we have tried to manage so that the students, while strictly conforming to certain requirements, shall at every stage of their work have a degree of latitude and freedom, always finding some necessary element to supply from their own taste and intelligence. We find that this tends, as we expected it would, to develop in every student whatever independence of character and spark of originality he may chance to possess.

How sedulously we have observed this principle even in the study of draughtsmanship, which, if anything, might be pardoned for being imitative, insisting that, even in copying a drawing, the copy shall not slavishly follow the mechanism of the original, I have already set forth at length in print. In the same spirit we accustom our students from the moment they come to us to exercises in what might be called absolute design, in which they have to rely, like the aboriginal savages, on their own taste and judgment and on the nature of things, not upon precedent or prescription. Indeed, as far as possible, we carry the same idea into the teaching of mathematics and mechanics, substituting problems for theorems and discovery for demonstration, wherever the subject to be investigated can be brought within the range of the student's own investigations.

But the final test of this procedure comes at the end of the course, and nothing gratifies us so much as to find, when the graduating theses come to be made, that they are as unlike each other as are the men who make them, that they seem to bear no common stamp characteristic of our school, however uniform they may be in excellence, and that they might reasonably pass as having been made under the instruction of as many different masters as there are students. They often look very much as if they had come out of so many different offices.

Indeed, to develop in the school a distinctive method in design by which the style of contemporaneous building shall be influenced and controlled, as the architecture of France seems to be influenced by the fashions which from time to time prevail in the Ecole des Beaux-Arts, is by no means our object. This would be, under the circumstances, an improper and most unbecoming ambition. It was, to be sure, suggested some years ago, in high quarters, that the schools in this country would do well to take up and solve the problem of developing a new architectural style, which should be thoroughly national and should express the characteristics of the twentieth-century civilisation in this country. But this cry finds no echo in our minds. It is for the architects themselves, practising in their offices, to create, as they may, the architecture of the future, by erecting the most sensible and beautiful buildings they can. It is the business of the schools to see to it, so far as we may, that the architects themselves have the good sense and good taste, and the self-reliance and independence of mind which shall qualify them for this task.

The thing upon which we chiefly rely, both to foster this individuality and to make up for our disadvantage in not being able to command the personal services of the best men, is the study of architectural history. This brings to the knowledge of our students such abundant resources that each can freely choose for himself what best suits his turn of mind, and, at the same time, brings into our service as coadjutors and colleagues the great masters of all ages.

It is the prominence thus given to historical studies which constitutes, I think, as also I have taken occasion to point out in print, the special characteristic of our work. It is the devotion to them of what might be considered an extreme amount of time and attention which chiefly discriminates this school from its neighbours. At one time, indeed, the attention given to these studies was somewhat excessive. But now that we are able—by an arrangement which is, I believe, unique in institutions of learning—very nearly to dispense with recitations and lectures in our fourth year, and to give all the time to work in design, the balance is corrected. We can now well afford, besides giving from three to five hours a week in the first three years to the study of architectural history and ornament, with

illustrative exercises in drawing and tracing, to add stated problems in historical design. In the second and third years, moreover, under the head of historical research, six or eight weeks are every spring given up to the study of the books and photographs and of the collections and museums at our command. Of this work each student brings every week a written report, accompanied by tracings, sketches and drawings.

This experience familiarises the men with books and accustoms them to their use, while it supplies them with abundant resources not only for the special exercises in architectural history, but for all their work. If they are at any time at a loss for a suggestion they turn as familiarly to Bramante or Peruzzi as to ourselves, and these masters become enlisted, as it were, upon our personal staff.

Nothing is more interesting, indeed, than to take a masterpiece of one of these masters, such as the arcade of Santa Maria della Pace, the façade of Santo Francesca Romana, or the great triumphal arch at Naples, study out its governing motives, both of construction and of expression, and give it out as a problem to be solved by the student. If then he makes a careful drawing from the original in the style in which he has rendered his own version, so that the element of draughtsmanship may be eliminated from the comparison, and compares the two drawings, it is as if he had the old master himself at his elbow, condemning his lapses in taste and judgment, as with authority. It will go hard if the comparison does not reveal some merit in the original work, either of conception or of execution, which might otherwise have escaped detection.

All this is rendered possible and made of inestimable value by the collections to which I have just referred. Of these our own store of photographs and drawings and of prints and engravings, all classified and arranged according to their subjects, forms a conspicuous part. The Willard collection of architectural casts and models at the Metropolitan Museum, probably the most carefully selected and best arranged, if not the largest, of any in the world, offers another opportunity of which, so far, we have made less use than perhaps we might. But the special thing to which the attention of the League should be directed is the splendid architectural library which the munificence of Mr. and Mrs. Avery has placed at their disposal and ours. The trustees of the University have greatly enhanced the value of this benefaction by administering it in the most generous spirit. They not only keep the library open through the evening, but have added close at hand a large room furnished with draughting-tables, a convenience not elsewhere to be found, while a special custodian well informed as to the contents of the books makes it easy and profitable to consult them.

I think there are only two points of importance that I have not mentioned. One is the instruction in office-work, which is carried on under the name of specifications, and which is supplemented by the course of lectures in building materials already mentioned. But this has no special interest for men who are already in offices. The other is this, that in our fourth year the men who wish to become architectural engineers separate from the others, substituting special studies in scientific construction and practice for the work in history and design. But this feature also I have made the subject of a paper which is still in print, and I need not detain you to explain the matter in detail.

CONNAUGHT CABINS.

At the congress of the Royal Institute of Public Health in Dublin a paper was read in the section of Preventive Medicine and Vital Statistics by Mr. R. B. Mahon, F.R.C.S.E., Ballinrobe, on the causes and management of outbreaks of typhus fever occurring in rural sanitary districts. He said :—In considering the importance of typhus as an epidemic disease one labours under the disadvantage of its study having become, shall I say, unfashionable. It is no longer to any extent a disease of important centres of population served by efficient sanitary staffs. It now scarcely ever attacks the well-to-do who live in good houses. The fear of its taking a wide-spread epidemic character no longer exists. It cannot at the present time even be called a prominent danger to armies in the field or to beleaguered towns. But it still exists, and to me and to medical men situated like myself it is an ever-constant source of anxiety, trouble and danger. The eighth degree of longitude carried down through Ireland divides the island into two fairly equal parts. The western part is more especially the habitat of typhus fever, and from portions of this district it is never entirely absent. In this district resides the remnant of the old Celtic race of Ireland. From various causes these people are poor, and a large proportion pass their lives ill-fed, ill-housed, ill-clothed, in apathy and ignorance. The sanitary laws are not efficiently enforced for reasons it would be scarcely proper for one in my position to detail. The people live for the most part in crowded villages under most unsanitary conditions. A typical west-country village is composed of from ten to twenty or thirty houses, not built on any regular plan as regards location of the dwellings. We find houses facing each other, houses behind others in relation to the village road, houses placed in T-shaped position, and all close together. A typical house has two doors, one on each side wall, and the direction of the wind determines which door shall be kept open. One or two bedrooms and a kitchen, or living room, with a loft, make up the available space inside, few of the houses exceeding 25 feet by 15 feet altogether. The windows to these rooms, when they possess windows, are small and often immovably fixed. Beside and in close proximity to the house is the cesspool into which all the refuse of the house goes, and in which manure is prepared for the land. The cesspool is always open and usually undrained ; indeed, the addition of a drain would be fatal to its utility, as it is in a measure a catchment basin for water, which aids the rotting of the manure. When full of manure these cesspools are not so offensive, but when the manure has been emptied away and nothing remains but foul, offensive slime-covered water, emitting noxious gases, they become dangerous nuisances. Oftentimes they are situated right behind the bedroom windows. In one of these bedrooms, perhaps not more than 10 feet by 6 feet, six, seven, even ten of the family may sleep. There is no ventilation, and the amount of poisonous air breathed is only regulated by the time spent in the room. In the kitchen, or off the kitchen, pigs, cattle, sheep and fowl may be kept, particularly in the winter season. Put all this animal life into this small space, shut the doors to keep out draughts in the long winter's night from 9 P.M. to 7 A.M., add deficient ideas of personal cleanliness, neglect of thorough cleansing out of the house for years, even the small quantity of fresh air that may enter (and this is sure to be small, for the greatest dread of the peasant is catching cold ; to this malign cause they ascribe all diseases), charged with the foul gases of the adjoining cesspool, the people themselves poorly fed and hard worked. Again, the condition of the water supply to these villages is often very bad, the wells in some instances being themselves mere cesspools. I have often noticed bad wells in villages infested with typhus, and the disease appears to me to be very virulent among those who habitually drink bad water. Now, nothing seems to be better established than the fact that typhus fever is a disease that complicates filth, poverty and overcrowding, and such an environment as I have depicted would be most favourable to the spread of the disease. When public suspicion of the existence of typhus in a house or in houses of a village is aroused, self-preservation institutes a rude system of isolation, which usually serves to limit the disease to the first infected houses. A rigid boycott is initiated, and the infected family is thrown entirely on its own resources. The still unaffected members can get no new living accommodation; they must take their chances in their old dwelling, and in consequence very often are struck down one after another. I have myself seen a house in which all the members of the family were struck down seriatim, with the single exception of the father of the family. He continued to occupy the same bed as his wife, although she was herself a very severe case. He was probably immune from a previous attack. Out of almost every family attacked some succumb, possibly the bread-winner, or the woman of the house, or a strong, able, working son helping to support the family. Reasoning by analogy, we may assume that a specific germ exists which is the essential cause of typhus. What its exact nature is we do not at present know. I incline to the opinion that it is a spore-bearing obligate parasite. The well-known favouring conditions for the development of this hypothetical parasite are defective ventilation, defective personal and household cleanliness, and overcrowding with deficient sunlight. As favouring conditions for its development in the human body may be added an enfeebled power of resistance, produced by the above-mentioned sanitary defects, by the presence of unhealthy gases in the air from fetid cesspools, and poverty, with deficient food and insufficient clothing. These defects obviously suggest their remedies. In dealing with an outbreak of typhus a sanitary authority should bear in mind the following points:—(1) The importance of early diagnosis ; (2) the prompt isolation not alone of the affected parties, but also of those living in the same houses ; (3) the proper disinfection of the infected houses, a measure which might well be extended to all the remaining houses of the village or neighbourhood. In the disinfection of houses no plan should, in my opinion, be considered satisfactory that did not fulfil the following conditions :—(*a*) The complete removal into the open air and light of heaven of all furniture, removable wood-work, bedding, clothes, &c. ; (*b*) the thorough washing of floors, ceilings, wood-work and walls with a suitable and efficient antiseptic ; (*c*) the removed furniture, &c., should be thoroughly washed with soft soap and an efficient antiseptic ; (*d*) thorough fumigation with sulphur, formalin, or such efficient germicide of the rooms in the infected dwelling ; (*e*) satisfactory lime-washing inside and outside of the house ;

(*f*) maintenance for some time of a thorough draught of air through the rooms; (*g*) efficient disinfection by superheated steam of all beds, mattresses, clothes, &c., which have come in contact with the sick, or been in the house while fever was there, or, failing such disinfection, destruction of these articles by fire. There is little doubt if such were done in all cases typhus would soon be as extinct as the dodo. To satisfactorily carry out their important duties a sanitary authority should possess the following apparatus, rules and staff:—(1) A properly constructed fever hospital with at least two observation wards; (2) a properly constructed and smart looking van, with stretcher for removing patients to hospital; (3) an efficient disinfecting chamber for clothes, bedding, &c.; (4) adoption of the Contagious Diseases Notification Act; (5) standard disinfectants, with directions for using laid down by instructional order of the Local Government Board; (6) a routine and efficient plan of house and furniture disinfection to be rigidly followed out in all cases, and laid down by instructional order of Local Government Board; (7) a thoroughly instructed and capable staff of sanitary officials; (8) rigid medical supervision of all sanitary measures; (9) a permanent nursing fever staff; (10) proper attendants for removal van. In the case of patients the diagnosis of whose cases has been made too late to allow of removal, or who, declining removal to hospital, and possessing proper lodging and accommodation, cannot be compulsorily removed, I suggest the following measures:—(1) strict isolation; (2) removal of unaffected members of the family to a place of safety. In the case of poor persons this would in the first place be the observation wards of the fever hospital; (3) provision in the case of poor persons of proper dietary and efficient trained nursing. To complete the measures we should prevent all wakes in fever cases, insure proper care at funerals and look to the general sanitary condition of the neighbouring houses and villages. For the last, these filthy cesspools should be absolutely forbidden. All drains should be properly cleaned and made efficient, a proper water supply should be obtained and the keeping of animals in dwelling-houses strictly tabooed. Compulsory ventilation should be established in dwelling-houses, and compulsory house-cleaning and lime-washing by order of the sanitary authority done once, or preferably twice a year, in the spring and autumn.

TESSERÆ.

Joseph Bonomi.

HE was born at Rome in 1739 and studied architecture under the Marchese Teodoli. In 1767 he was invited to England by the brothers Adam, and was for many years employed by them as an assistant and architectural draftsman. The acquaintance which he formed in London with Angelica Kauffman, then in the zenith of her fame, led to his marrying her cousin and ward, Rosa Florini, in 1775. When Angelica returned to Italy, after her marriage with Zucchi, the painter, she induced Bonomi to do the same, and he left England in 1783, taking with him his family of three young children; but he did not remain in Italy above a year. About five years after his return, in November 1789, he was elected an Associate of the Royal Academy, but was never raised to the rank of R.A., although Reynolds interested himself very warmly in his behalf, and did all that he could to obtain for him the professorship, which was bestowed on Fuseli. Bonomi died March 9, 1808, leaving a widow and six children, the eldest of whom also practised as an architect; and another son was known as an authority on Egyptian antiquities. Bonomi's chief professional works were additions and alterations at Langley Hall, Kent, 1790; the chapel of the Spanish Embassy, near Manchester Square, London, 1792; Eastwell House, Kent, 1793; the pyramidal mausoleum in Blickling Park, Norfolk, 1794; Longford Hall, Salop; mansion at Laverstock, Hants, 1797; mansion at Roseneath, in Dumbartonshire, for the Duke of Argyll, 1803, which is his most celebrated work, although chiefly remarkable for the heresy, if not the solecism, of an entrance portico with a column in the centre. The reason assigned for this caprice is that, as the portico was intended for carriages to drive through, it was thought a column in the centre of the front would express its purpose better; yet, besides having a most awkward effect in itself, a column in that situation is not a little objectionable, on account of its obstructing the view from the entrance door. Nevertheless the design is praised as displaying originality of genius. Bonomi also made designs for the new sacristy of St. Peter's at Rome, of which edifice he had been appointed honorary architect in 1804.

Florentine, Roman and Venetian Styles.

The Florentine is mostly astylar, the style of fenestration and rustic quoins; the Roman, the style of pilasters; the Venetian, that of columns. In calling the first astylar, we do not imply the total absence of external orders, but their absence as main features or on any considerable scale. Their chief application is to windows and doors, and the greatest orders never include so much as the height of a single storey. In the Roman school the great scale of the principal order renders it chiefly an order of pilasters, since the entablature could hardly be carried from column to column, except by disingenous contrivances which the art was not yet debased enough to allow. The interpilasters, however, of the great order were often filled in with smaller and columnar ones in two tiers, while a still smaller set, decorating the openings, yet further enhanced the apparent scale, or rather enabled the eye truly to estimate the greatness of the actual scale, which in large buildings affecting Grecian purity is hardly possible. As the Venetians did not use such large orders they easily made them more columnar, and introduced hanging entablatures, beautiful though useless. In this school there is (except in churches) no principal storey or principal order; for if there be only one, it is mounted on a basement sharing attention with itself, and if there be more than one they are nearly equal, or equally important arcuation is almost absent from the Florentine, only sparingly used in the best Roman, and most abundantly in the Venetian schools. General plan in outline in the Florentine is of the utmost simplicity and compactness (rendering it fitter for town than country buildings); in the Roman slightly more varied; in the Venetian (whenever an open site will admit), broken, complex, picturesque and poetic, like the architecture of a a painter's backgrounds, pyramidising, *percée à jour*, and bristling with detached members. It is, of course, the only school attractive to the young, the romantic, the half-cultivated taste, and hence it naturally became the parent of all other schools, as far as the advance of the new or modern order of things would permit anything like schools to arise, which was only very imperfectly the case after the introduction of the modern architecture into France, England and other transalpine countries.

Rubens as a Colourist.

What has been said of Michel Angelo in form may be said of Rubens in colour; they had but one. As the one came to nature and moulded her to his generic form, the other came to nature and tinged her with his colour—the colour of gay magnificence. He levelled his subject to his style, but seldom if ever his style with his subject; whatever be the subject of Rubens—legend, allegoric, stern, mournful, martyrdom, fable, epic, dramatic, lyric, grave or gay—the hues that embody, the air that tinges them, is indiscriminate expanse of gay magnificence. If the economy of his colours be that of an immense nosegay, he has not always connected the ingredients with a prismatic eye; the balance of the iris is not arbitrary, the balance of his colour often is. It was not to be expected that correctness of form should be the object of Rubens, though he was master of drawing and even ambitious in the display of anatomic knowledge; but there is no mode of incorrectness, unless what directly militated against his style, such as meagreness, of which his works do not set an example. His male forms, generally the brawny pulp of slaughtermen; his females, hillocks of roses in overwhelmed muscles, grotesque attitudes and distorted joints, are swept along in a gulf of colours, as herbage, trees and shrubs are whirled, tossed and absorbed by inundation.

Contrast in Painting.

The rule of contrasting figures or groups is not only universally known and adopted, but it is frequently carried to excess. The artist is advised not to destroy the grandeur and simplicity of his design by violent and affected contrasts. The artless uniformity of the compositions of the old Gothic painters is far preferable to this false refinement, this ostentatious display of academic art. A greater degree of contrast and variety may be allowed in the picturesque or ornamental style, but we must not forget that they are the natural enemies of simplicity, and consequently of the grand style, and destroy that solemn majesty, that soft repose, which is produced in a great measure by regularity and uniformity. Those two qualities are separately exhibited by two great painters, Rubens and Titian. The picture of Rubens is in Antwerp, the subject (if that may be called a subject where no story is represented) is the "Virgin and Infant Christ," placed high in the picture on a pedestal, with many saints about them and as many below them, with others on the steps, to serve as a link to unite the upper and lower part of the picture. The composition of this picture is perfect in its kind; the artist has shown the greatest skill in disposing and contrasting more than twenty figures without confusion and without crowding; the whole appearing as much animated and in motion as it is possible where nothing is to be done. The picture of Titian which we would oppose to this is in the church of the Frari at Venice. The peculiar character of this piece is grandeur and simplicity, which proceed in a great measure from the regularity of the composition, two of the principal figures being represented kneeling directly opposite to each other, and nearly in

the same attitude. This is what few painters would have had the courage to venture ; Rubens would certainly have rejected so unpicturesque a mode of composition had it occurred to him. Both these pictures are equally excellent in their kind, and may be said to characterise their respective authors. There is a bustle and animation in the work of Rubens, a quiet, solemn majesty in that of Titian. The excellence of Rubens is the picturesque effect which he produces. The superior merit of Titian is in the appearance of being above seeking after any such artificial excellence.

Etruscan Tomb-Paintings.

If not the most valuable part of the spoils obtained from the Etrurian tombs, the paintings on their walls were not the least interesting, especially when first discovered, for since that time they have all suffered by exposure to the air. While they are for the most part more carefully and better executed than the Egyptian paintings, they are equally curious, inasmuch as they are almost the only existing records of a people respecting whom history has preserved very little. One of the most interesting sepulchral chambers is that which has been named from the subjects represented on its walls the "Camera del Triclinio del Ballo." In the "Triclinio," or banquet scene, are three couches, with a male and female figure upon each, crowned with wreaths of ivy and myrtle and richly attired. Everything bespeaks luxurious refinement—the embroidered tablecloth and draperies on the couches, the rich dresses of the attendants, the quantity and variety of the vessels heaped up on the sideboard, and the number of dishes with which the table is set out. Nor does the other scene convey a less favourable idea of the gaiety and liveliness of an Etruscan dance. The subjects of some of the paintings that have been discovered are, however, of a very different character, and as a contrast to the above may be mentioned those in what is distinguished by the name of the "Camera de' Morti" at Tarquinii, one of which represents a procession of the dead conducted by genii to their final judgment.

Raphael's Ideal Figures.

In the characters with which some of his angels are endowed Raphael has shown what may be accomplished by art in this respect ; the countenances are not merely lovely, but divine. The union of intellect and of feeling and beauty of the highest order is here accomplished. Features, attitude, grace, action, figure—all combine to aid the effect. His angels are not only superhuman, but they are celestial also, and they are not only celestial, but superhuman. Their very emotions and passions and actions, as well as the character of their countenances, betoken too their high nature and their distinction from corporeal personages. Even sex seems to have merged into their celestiality, and beings possessing the highest and purest qualities are created by the artist's power. Nor in expression and character which this great painter has given to persons intended to represent real men has he been less successful, as evinced by the numerous exquisitely-drawn countenances and figures depicted in the cartoons, each true to nature and to their own individual qualities. In the portrayal of beings of a higher order than the common race care should be taken to endow them with character in all respects suitable to their exalted station. Attitude and propriety of figure will sometimes essentially aid in the foregoing respects. Truth to nature forms, as it were, the climax which crowns the whole. There is, moreover, to a certain extent an expression and a character, too, not only in the face, but in the form and figure, which serves to correspond with and to carry out the expression of the countenance.

Corrodies.

Under the head of corrodies were included many varieties of singular rights and privileges claimed by the founders or benefactors of a religious house. The following is a very curious instance of the surrender of a corrody for a pecuniary compensation. A lawsuit had arisen in the thirteenth century respecting the customs and services due from the priory of Lewes to the manor of Longeney. The lord of the manor, William of Echingham, in agreeing to a compromise, enumerates his former claims :—"The priory was bound to receive me, with my wife and all family and horses, four times a year, to be blooded and to dwell there at the expense of the priory each time for three days (and on the fourth day to the hearing and singing of the Mass), either in the halls of the convent or in other competent houses, and to supply with food and drink and all other things necessary at my stay and arrival. And, moreover, they were bound to keep at their expense in the said priory one charger or one palfrey and one youth through the whole year, and that the said youth should receive all necessaries and a robe of the same fashion as the prior's youths, and they were also to support one youth in the kitchen of the prior in order to learn the business of the cook for the hall ; he was to have his allowance, robe and shoes with the men in the service of the prior. Further, they were bound to keep two puppy greyhounds or beagles until they were a year old, and I was entitled to remove whenever I pleased the horse, the youths and the puppies, and to substitute others in their stead." All these claims he surrendered for the sum of 100*l*. The very frequent allusions to corrodies or to contracts of that nature in monastic annals prove that the religious houses were to a great extent not only inns for the reception of travellers, but the great bakeries, brewhouses, kitchens and surgeries of the neighbourhood, places of general education, and schools of training for various crafts. It is easy to see that in all these ways they must for a time have been great blessings to the country. They were centres of civilisation and humanity as well as of religion, in the midst of barbarism and ferocity. On the other hand, the amount of secular business in which they were involved by the management of their landed property, and by the transactions of which specimens have just been given, undoubtedly tended to lower their religious tone.

GENERAL.

Don Federico Madrazo, the director of the Madrid Academy of Fine Arts, has died in that city. He was born in 1815, and was the son of Don José Madrazo, the Court painter. One of Don Federico's sons, Raymond de Madrazo, is also an artist who is well known in Paris.

The Tapestries in the Queen's Gallery of Hampton Court Palace have just been replaced after undergoing cleaning operations. The tapestries were discovered some thirty years ago quite by an accident, the superintendent of the apartments (Mr. W. H. Pleasants) seeing them through defective woodwork, which was observed on a picture being removed.

M. Falquière is now engaged on a sketch-model of the statue of Balzac for the Société des Gens de Lettres, which it is proposed to erect in the Palais-Royal. It is to be hoped the sculptor will be more fortunate than was M. Rodin with the same subject. M. Falquière has finished the rough model of the monument in honour of Pasteur. The scientist is represented seated, and draped in a sort of toga. A young woman is in the act of entrusting her child to him, while in the background a figure, symbolising Death, starts back in the attitude of one who is vanquished.

The Bishop of Bristol has received numerous promises of support for the proposed restoration of Malmesbury Abbey. It is rightly felt, says a correspondent of a contemporary, that the local restoration committee could find no better adviser than Dr. Browne, who is pre-eminent as an archæologist. It is fitting that this unique Wiltshire abbey should be preserved in the best possible way. Only the nave with its aisles, a part of the transept and the splendid south porch now remain. It dates from the twelfth century, and, as old Leland said, it is indeed "a right magnificent thing."

The Colony of Queensland has taken 30,000 feet of space in the "Greater Britain Exhibition," which will be held next year at Earl's Court. The greater part of Queensland's display will be devoted to the collection of minerals which is being made in the colony for show in London and Paris, but it is expected that the colony will also exhibit specimens of products in other departments. Mr. R. L. Jack, head of the Geological Department, will be in charge of the Queensland mining exhibit.

Mr. Donnelly, a painter, has discovered on the banks of the Clyde, at a spot between Dumbarton Rock and Dunglass, what is supposed to be a lake dwelling, or "crannog." It is thought that the remains belong to the same period as the occupation of the neighbouring hill fort of Dunbuie, discovered a couple of years ago, and regarded by archæological experts as among the most valuable finds of recent years. The officials of the Helensburgh Antiquarian Society, who carried through the Dunbuie excavations so creditably and so successfully, have undertaken to make a thorough investigation of the supposed crannog.

The Sub-committee for examining and reporting upon the competitive plans for the buildings for the 1901 International Exhibition in Glasgow have made a selection of seven of the sixteen designs sent in, and have remitted them to the measurers with instructions to measure and report on cost.

Plans have been passed by the improvement committee of the Manchester Corporation for the new Midland Railway Hotel, which is to be erected on the Concert Hall site. The elevations to Windmill Street and Lower Mosley Street were not presented, but the committee had before them the other plans in detail, including that for the new concert hall, which forms part of the company's scheme. At the same meeting plans for the new Religious Institute, to be erected at the corner of Deansgate and Lloyd Street, were also passed.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

LIVERPOOL.—Oct. 3 (time extended).—Designs for new buildings for Royal Institution. 50 guineas, 20 guineas. Mr. Harold Waterhouse, hon. sec., 3 Cook Street, Liverpool.

STOCKHOLM.—Aug. 31.—Designs for railway station. Particulars from the Offices of the Consulate, 27 Great Winchester Street, London.

WIDNES.—Sept. 12.—For erection of relief offices and vaccination station. Mr. J. P. Fraser, architect, 4 Bold Street, Warrington.

THE Canterbury Town Council has asked the Local Government Board to sanction a loan of 70,000*l.* for the provision of a lunatic asylum, and the scheme is opposed by Earl Sondes, the Dean of Canterbury, and others. In the course of the Local Government Board inquiry, the medical superintendent of the Kent County Asylum at Chatham said that the increase of lunacy in Kent is about sixty cases a year, and it was also shown by statistics that in the country generally lunacy has increased nearly threefold in forty years.

TENDERS.

ELECTRIC NOTES.

THE construction of an electric light railway on the overhead system between Margate and Ramsgate, by way of Broadstairs, has finally been sanctioned by the Board of Trade. It is hoped that the railway will be completed before next summer.

AT a meeting of the lighting committee of the Liverpool City Council it was decided to extend the electric mains in Copperas Hill, School Lane and Victoria Street. The engineer's report showed that for the past month there had been an increase of 1,523 16 candle-power lamps connected with the supply mains, when compared with the number for the corresponding period of last year. In other respects the committee considered that satisfactory progress was being made.

PROFESSOR KENNEDY, in his report upon the lighting of Grimsby with electricity, presented at the last meeting of the lighting committee, stated that a well-conducted municipal electrical undertaking might now be considered as certain of success, both from the technical and financial points of view. This was the case even where it was only proposed to supply current for lighting purposes, whereas in Grimsby they also expected to be able to supply current to the tramway company for power, therefore success was still more certain. The estimated cost was put down at 35,000*l*, but in view of contingencies of slight alterations and extensions, it was advised that 40,000*l*. should be applied for as the probable capital expenditure. He recommended the use of a continuous current three-wire system, and as a site a quantity of land belonging to the Corporation to the north of the old cemetery. It was assumed that within a year or two of the opening of the station there would be a total of about 9,000 lamps of 8 candle-power or their equivalent connected to the mains, but of these not more than 5,000 would be alight at once. The total power of the plant to be put down in the station, including reserves, would be about 750 horse-power. Separate mains would be required for tram lines. A route was mapped out in the report for public lighting by electricity. Professor Kennedy did not consider it would be worth the while of the Corporation to supply electricity to the docks. The report of the sub-committee respecting the supplying of electrical power to the tramway company contained a number of important conditions. They state that the company, on making their line an electric traction, shall purchase the power from the Corporation at the rate of 1½*d*. per Board of Trade unit for the first 360,000 units used, and to guarantee to take a

Also, Testimonials from Dr. Hassall, September 28, 1868; the late Dr. Letheby, February 15 1865, and December 1872.

Price, £1 10s. and upwards. **Portable Filters on this System, £1 5s. to £3.**

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s*. 6*d*. and 6*s*. each. Household and Fancy Filters, from 7*s*. 6*d*. Water-testing apparatus for detecting impurities in Water, 10*s*. 6*d*. and 21*s*. each.

Portable Cistern Filters.

175 STRAND, W.C. (Four Doors from Somerset House), LONDON.

minimum of 360,000 units per annum; above 360,000 and up to 460,000 units, the charge to be at the rate of 1⅜*d.* per unit, and all above 460,000 units to be charged at the rate of 1¼*d.* per unit. The tramway company are to reconstruct the present lines, to double them from the depôt to the Old King's Head in Victoria Street, and to construct an additional loop line from the latter place, *viâ* George Street and Osborne Street, to the White Hart Hotel. The company are to run a 7½ minutes' service from April 1 to October 31, and a ten minutes' service during the remainder of the year, and to institute a system of universal penny fares within the borough. The committee eventually decided to adopt the report.

TRADE NOTES.

THE Atkinson Morley's Convalescent Home, Wimbledon, has recently been refitted with Berkefeld filters.

MR. W. P. BUTTERFIELD, of the Shipley Galvanising Tank and Cistern Works, gave his employés an outing to Southport on Saturday last, the 20th. Dinner was served at the Hoghton Arms Hotel, when about thirty sat down. After dinner the various places of interest were visited. Tea was served at six o'clock, after which a vote of thanks was proposed by Mr. Harry Brogden, foreman.

TOWNLEY'S HOSPITAL, Bolton, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues, patent Manchester grates and extract ventilators.

MESSRS. STEPHENS, whose name in connection with writing inks, gum, &c., has become a household word, and the high quality of whose manufactures is attested by the fact that they are the holders of no fewer than twenty medals gained at the various exhibitions at which their manufactures have been shown, and where they have in each case taken the highest award made, have sent us a booklet artistically illustrated with interior and external views of the new offices the rapid expansion of their business has rendered indispensable, and their manufactories and warehouses. The new office building is being erected in Aldersgate Street, and will occupy the site on which once stood the town house of the Earls of Lauderdale. The manufactory and warehouses are situated in the Holloway Road, where they cover about half an acre, and at Finsbury Park, where more recently an area of 1¾ acres has been utilised for the purpose, and it is not too much to say that these are the largest and best-equipped works for the production of writing-ink in the world. *Apropos* of the present heat, Messrs. Stephens inform us that in addition to the well-known inks and gums to which they owe their world-wide reputation, they have introduced a preparation which they call "Skeevit," which is said to prevent the bites of mosquitoes and other troublesome insects.

BUILDING AND BUILDERS.

IT is with much regret that we learn of the death of Mr. G. de Nyst Clark, one of the partners in the business of Messrs. Patman & Fotheringham, the well-known builders and contractors. The sad event occurred at Mundesley on the 10th inst. whilst bathing. The body was not recovered until Saturday last, having been washed ashore some three miles from the scene of the fatality. Mr. Clark was a man very much esteemed and liked in the City, and many will be sorry to hear of his death.

THE Wesleyans are building a church at Kirkhammerton, in the Knaresborough Circuit.

THE purchase of a site for the Llandudno county schools has now been completed, and the erection of the new buildings is to be proceeded with without delay.

THE Roman Catholic Bishop of Leeds recently laid the foundation-stones of a new Roman Catholic school in Harehills Road, Leeds. Ultimately it is intended to erect, in addition to the school, a church and a house for the clergy.

A MISSION hall in connection with Edrom Parish Church is being erected at a cost of about 300*l.* at Chirnside Bridge Paper Mills. The foundation-stone was laid on Saturday afternoon by Lady Houstoun Boswall of Blackadder.

THE whole of the work in connection with the erection and completion of the new church at Hessay, near York, has been entrusted to Mr. Anthony Lyons, contractor, of Norton, Malton. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect.

AT a meeting of the buildings regulation committee of Glasgow Corporation last week it was agreed that a minute should be brought up at a meeting of the Town Council on Monday, providing that, as in London, the height of buildings in the city should not exceed 85 feet.

CASES FOR BINDING THE ARCHITECT.
Price Two Shillings.—Office: 175 Strand, London, W.C.

THE committee of the proposed Church House for the diocese of Liverpool has just approved plans prepared by the diocesan surveyor, and building operations will shortly be begun on the site in South John Street and near Cable Street.

A PUBLIC-HOUSE at Reading, known as Dowsell's, in the course of demolition suddenly collapsed on Wednesday morning, and an overseer, named Ennetts, had his thigh broken. Several other workmen escaped marvellously.

THE directors of the North-Eastern Railway Company intend to erect thirty-six cottages for their employés near the railway station at Tweedmouth. Some time ago the men petitioned the directors of the company to build houses for them, in consequence of deficient accommodation in the town.

A DISASTROUS fire broke out on the docks at Milford Haven about a quarter-past eight on Wednesday morning. Hancock's sawmills and works, and premises on either sider, including a large ship-engineering workshop, were all burned to the ground. There was no wind, or the whole block of twenty workshops would have gone, as there is no fire-engine either in the town or on the docks.

THE surveyor having submitted a report as to the condition of the roof of the large ballroom at the Liverpool Town Hall, the chairman of the finance committee and the chairman of the financial sub-committee have been authorised to inspect the work and order, if necessary, the reconstruction of the roof and ceiling, to be carried out by Messrs. Brown & Backhouse, at a cost of not exceeding 3,000*l.*

THE Great Western Railway Company are about to rebuild Swindon Station. The new station will not be on a very large scale, since the fast trains between London and the west of England simply run through, and passenger traffic to and from Swindon is not very extensive, the place only bulking largely as being the headquarters of the locomotive, carriage-building and general engineering works of the Great Western.

A FIRE burst out half an hour before midnight on the 20th inst. at the Britannia Works, Kensal Road, W., of Messrs. S. Ransom, builders and contractors. A huge building of one, two and three floors, extending 50 yards in one direction and 20 in another, which was used by the firm as a manufactory, offices and stores, became ignited from some unknown cause. Several engines attended, but when it was seen that several private houses close by, many of them let out in tenements, were becoming involved, some extraordinary scenes of excitement, panic and confusion were witnessed. Twelve steamers and several hydrants were eventually got to work, and with an admirable supply of water the firemen succeeded in mastering the fire about an hour before daybreak.

THE foundation-stone of a college to be erected on land in the Filey Road, Scarborough, was laid on Wednesday last by Mr. George Lord Beeforth, an ex-mayor of the borough. The site commands magnificent views of both land and sea. The Scarborough College Company are the proprietors, and the work will necessitate an expenditure of about 10,600*l.* The dining-hall is to be capable of accommodating 100, and the schoolroom 200 boys, and it will be capable of extension.

SOON after six o'clock on the 24th inst. a fire occurred, which resulted in the destruction of the premises of Messrs. C. Read & Co., saw mill proprietors, 53 East Road, City Road, N. The property attacked consisted of a range of buildings, one and two floors in height, which extended about 50 yards in one direction and 30 in another. These were used as engine and boiler house, workshops and stores. The fire extended to the premises occupied by Messrs. B. Bridgwater & Co., engineers, which were also entirely destroyed, and unfortunately neither of the firms was insured.

THE strike of Shrewsbury bricklayers' labourers, which commenced some months ago, came to a conclusion on Saturday. At the onset the men demanded an increase in wages from 5*d.* to 5½*d.* per hour, and the masters agreed to give an advance of ¼*d.* conditionally on the men not turning out. This offer the men refused, the strike began and the masters withdrew their offer. At a meeting on Saturday afternoon between a deputation representing the men and the Master Builders' Association, the latter agreed to give the men ¼*d.* per hour advance on condition that Rule 2 of the Labourers' Society was altered to read as follows:—"That the ordinary rate of wages for efficient men shall be 5¼*d.* per hour, inferior men to be rated by the employer." This was accepted by the men.

THE North-Eastern Railway Company are making arrangements for the construction of a new high-level bridge over the Tyne. The project is to have four lines of rails, so that the new bridge will provide accommodation for a large volume of traffic. At present trains on their journey from north to south have to run into the station from the east, and then run out again in the same direction, it being thus necessary to transfer the locomotive from one end of the train to the other, or put on a new engine. With a new bridge in the position indicated

this inconvenience would be obviated, and trains would be enabled to proceed right through the station. In 1850 the total number of persons who travelled from Newcastle was comparatively small, but in 1886 it had reached 2,089,977, and ten years later this number had grown to some 2,750,000.

VARIETIES.

At Herne Bay property of all kinds has advanced very greatly in value, and one of the local auctioneers at a sale last week sold every house and plot of land offered at prices which constitute a record for Herne Bay.

The ceremony of opening the memorial in the Kremlin to Alexander II. will take place in a few days. Deputations and troops from all parts of Russia have arrived to take part in the ceremony.

The Beulah chapel, Bexhill-on-Sea, which has been recently erected, under the auspices of Mrs. Spurgeon, as a memorial to her husband, the late Rev. Charles Haddon Spurgeon, was opened last week.

Acton Church, Nantwich, which is one of the oldest edifices in the country, will shortly be reopened after undergoing extensive alterations. The nave of the church has been completely restored at a cost of nearly 6,000*l.*

Rushton Roman Catholic church was on the 22nd inst. reopened by the Bishop of Shrewsbury, after restoration and renovation. The church is one of the most ancient in Cheshire, the original foundation dating back about 600 years.

The will of the late Lady Shaftesbury, of Belfast Castle, has been proved, the gross value of the estate being 78,000*l.* Among her ladyship's bequests is one of 7,000*l.* towards the erection of a Protestant Cathedral at Belfast, the charities of which city will also benefit to the amount of about 40,000*l.*

Colonel Sir Francis Marindin, from the Board of Trade, accompanied by the Company's principal officials, inspected on the 19th inst. the alterations and increased accommodation which the North British Railway Company have completed at their Kelso station.

The Tong District Council new sewage disposal works, which have been constructed from plans by Mr. John Drake, of Queensbury, are rapidly approaching completion. The contractor is Mr. F. Robinson, of Thornton, and the clerk of works Mr. James Heseltine, who superintended the carrying out of similar works at Pontefract. The cost of the works will be over 7,000*l.*

The Sidmouth Council have completed its costly new sewerage scheme executed by Mr. James Mansergh, C.E., and Sidmouth has now been pronounced in the official report to the County Council as "ahead of all similar places in South Devon" in matters of sanitation.

The ancient church of Llantwit-major, in the Vale of Glamorgan, needs restoration, and by means of a bazaar recently held a sum of 450*l.* was procured. Its ancient associations, for it was here that an ancient British school of learning was located, give it an interest beyond the diocese.

Mr. R. Lakin, of Messrs. Greaves, Bull & Lakin, has intimated his willingness to present to the British Museum the great fossil reptile which was recently discovered on his property, the Cliff, Warwick. The Museum authorities are of opinion that the find will turn out to be of greatest interest and scientific value.

Insh (Kingussie) parish church, which ancient edifice has just undergone complete internal reconstruction, is now open for public worship. It is said that a church was founded on the site by Adamnan, and that worship has been carried on continuously for 1,000 years.

An area of brick paving, about 14 feet by 12 feet, in front of the shop of Mr. Bagshaw, fishmonger, Alcester Road, Moseley, fell into a cellar built under the footpath on the 19th inst. Fortunately there was no one entering or leaving the shop at the time. The cellar is 8 feet or 9 feet deep, and the fall is attributed to the supports being insufficient to bear the weight of the pavement.

At a meeting of the Dumfries Town Council a letter has been read from Mr. Andrew Carnegie offering 10,000*l.* for the erection of a library, provided the Free Libraries Act is adopted by Dumfries and Maxwelltown. Mr. and Miss M'Kie, of the Moat House, Dumfries, have given a free site for the purpose of the library building.

Lord Masham, accompanied by the Mayor and officials of the Bradford Corporation, visited Manningham Park on Wednesday afternoon with a view to consultation regarding the site of the proposed Cartwright Memorial Hall. His lordship expressed an opinion in favour of one with a frontage towards the principal entrance to the park on the site of the present

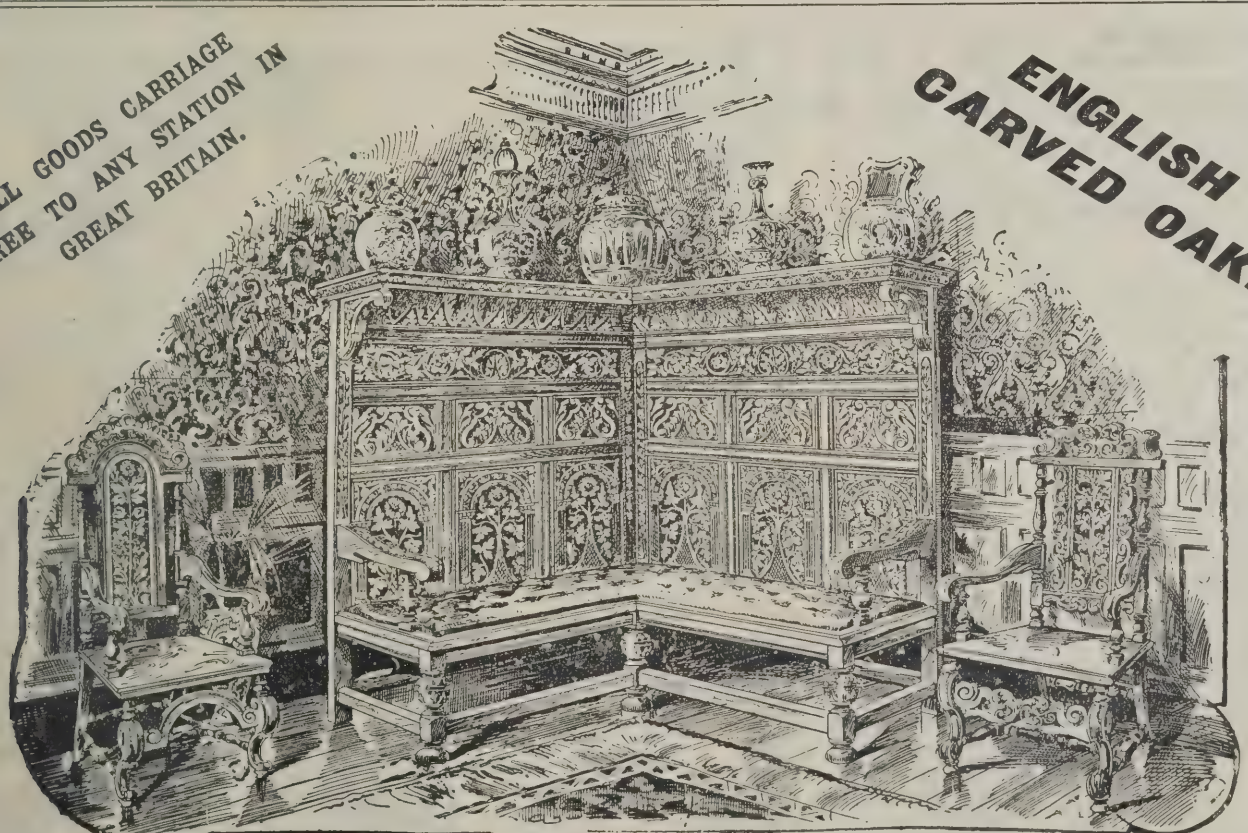
hall, and it is anticipated that a decision will be arrived at accordingly.

At the Royal Botanic Society's Gardens, Regent's Park, a new public café has been erected, together with a private dining-hall 45 feet long by 30 feet wide, reading and reception-rooms and ladies and gentlemen's cloakrooms. There is a spacious hall lounge, entered from the main conservatory. With the exception of the café the building is intended for the exclusive use of fellows of the Society and their friends. The foundations and superstructure were carried out by Messrs. Huntley Bros., of Croydon; the decorations and furnishing by Messrs. Maple & Co., Limited, and the heating by the Thames Bank Iron Company. The architect is Mr. H. W. Hetherington Palmer, of the Outer Temple, W.C.

The Lords of the Committee of Council on Education have received a request on behalf of the Hungarian Government for a selection of works, for which awards have been made in the national competition of this year, to be sent on loan at the expense of the Hungarian Government for exhibition in the new industrial art museum at Buda Pesth, and their Lordships have promised to afford every facility. The schools of art are being asked to state in each case whether works may be sent.

The first prize of 35 guineas in the public competition for the best design for laying out the Appleton House estate as a public park has been awarded to Messrs. William Barron & Son, Elvaston Nurseries, Borrowash. The area of the park is about 36 acres, and in addition to the general plan of the park, which contains a lake, cricket and recreation grounds, lawn-tennis grounds, bowling green, gymnasium, &c., they also furnish three alternative plans for dealing with Appleton House and premises; also designs for entrance gates, bandstands, shelters, fountains, &c.

At the Guildhall, Oswestry, last week, in connection with the 500th anniversary of the first Royal charter granted to the town by Richard II., the mayor (Dr. Aylmer Lewis), supported by the recorder (Mr. Lloyd Kenyon), the vicar (the Rev. Norman Ogilvy), Colonel Lloyd (Aston), Capt. Wynne Corrie, Mr. Stanley Leighton, M.P., Mr. R. Venables (vice-chairman of the Salop County Council), presided over a large company, which included almost every member of the Corporation, when the freedom of the borough was conferred upon the town clerk (Mr. J. Parry Jones).



The preparations are well advanced for opening the new extension of the Hampstead workhouse, which has been erected by the Hampstead Guardians at the junction of Heath Street and North End, Hampstead. The new structure, which will accommodate an additional 100 inmates, will cost about 30,000*l.* The electric light will be installed throughout, and the accommodation, the great object of which is by means of classification to be able to make a distinction between the deserving and the undeserving poor, will be of the most modern description, while ample facilities are intended to be provided for recreation.

The District Council at Rhyl have nearly completed the first section of the Western Promenade extension. The work is being undertaken in front of the old Winter Gardens, which are now laid out for building sites. The work, which will cost several thousands of pounds, is undertaken by the Council without a contractor, Mr. Robert Hughes (town surveyor) being the engineer. The works consist of a sea-defence wall, with a promenade, carriage-way and parapet on the land side. At the completion of these works it is expected that the sea defences and erection of a promenade at the Marine Drive will be undertaken, and for which the Local Government Board have sanctioned a loan. A Birmingham firm have applied to the Council for permission to lay down an electric tramway from the Grand Pavilion along the sea front, a distance of four miles, to Prestatyn.

A United Methodist Free Church was opened on Wednesday last in the new and populous district of Leeds known as Harehills. Situated in Ashley Road, which is a continuation of Beckett Street, it is in the Lady Lane circuit. The structure is of a temporary character, being of corrugated iron upon a red brick base, and this will be used as a school and chapel until the progress of the cause in the district warrants the erection of a permanent building. As there is no

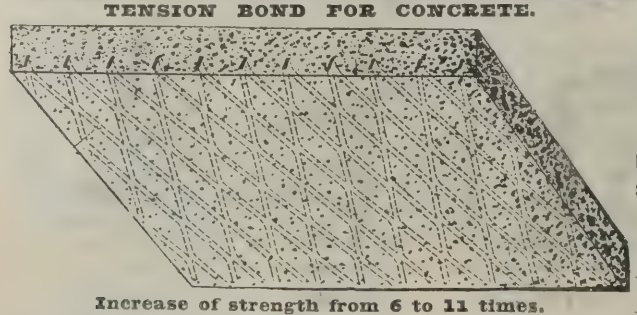
other place of worship in the vicinity, it is anticipated that a considerable congregation will soon be obtained. So far sitting accommodation has been provided for 250. The site cost about 450*l.*, and the structure has entailed an expenditure of equal amount, making a total of about 900*l.*

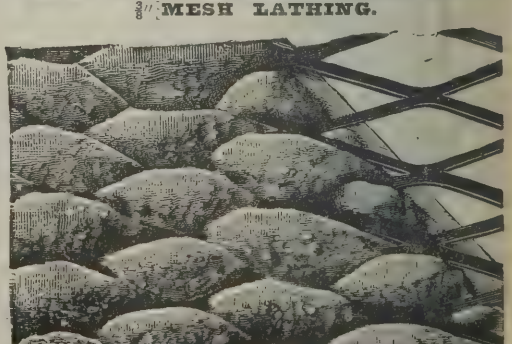
THE new central sanitary depôt, upon which the Leeds Corporation are spending over 30,000*l.*, is nearing completion, and will be formally opened early next month. The site is in Dock Street, to the south of Leeds Bridge, where stabling accommodation is provided for 168 horses. Commodious offices, store-rooms and sheds for the many vehicles that are used in the scavenging and water-cleansing department are also being built. The land on which the new depôt is built has cost about 20,000*l.*, and the buildings will necessitate an expenditure of about 13,000*l.* The whole of the land, however, is not being used for the purposes of the depôt. About a thousand yards are being utilised to widen Dock Street and the other thoroughfares bounding the site.

REGISTRATION OF PLUMBERS.

A CONGRESS of plumbers has been held in Glasgow, when the subject of "Registration" was considered.

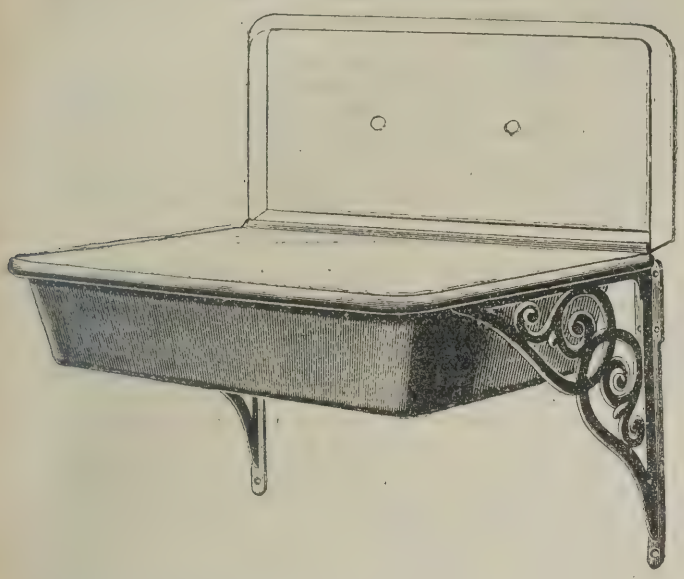
Mr. W. R. E. Coles, clerk to the Worshipful Company of Plumbers, said the whole fabric of the congress rested on the two broad facts that registration was actually one of the most elementary conditions of organisation, inasmuch as there could be no corporate body without it; and the necessity for registration of plumbers had been affirmed by common consent of the plumbing craft throughout the kingdom, the medical profession, the sanitary authorities, architects and others particularly acquainted with the subject, as well as by increased majorities in the House of Commons whenever the Plumbers' Registration Bill had been before Parliament. He pointed out that the necessity for plumbers' registration was first affirmed at a meeting held in London in 1884, and in the fourteen years which had since elapsed the proposition had been approved by public meetings in all the principal centres in England, Ireland, Scotland and Wales. The advantages of registration were primarily that it enabled members to legally combine for the common purpose of building up and maintaining their status, and the public to distinguish those who were qualified and responsible for the discharge of their duties. Indeed, registration was the final condition of legal qualification. Abuses could only be assaulted or met from some vantage ground or stable position such as a register afforded. The methods of registration adopted for the National Registration of Plumbers had stood the test of fourteen years' experience, and should be continued. He further urged that the necessity for registration should be impressed on the employers and workmen, on the sanitary authorities, on the educational authorities, and particularly on the architects, who were held primarily responsible for the efficiency of all the arrangements of the house built under their direction. He added that the necessity should also be pressed on the attention of Parliament and the public at large.





It was agreed to refer the subject to a committee composed of the secretaries of the six district councils.

The following resolution was also agreed to:—"That this ninth annual congress of the registered plumbers, local health authorities, medical men and educationalists in Scotland renews its approval of legislative sanction being given to the registration movement, and its desire that the Bill be reintroduced next Session of Parliament; recommends that a strenuous effort be made by the promoters of the Bill, by deputation or otherwise, to induce the Government to adopt the Bill; and calls upon the district councils of Scotland to take prompt and energetic action for the same object."



An exhibition, at which the following firms were represented, was held in connection with the Congress:—Evered & Co., Limited, T. B. Campbell & Sons, the Falkirk Iron Company, Robert Brown & Sons, J. & M. Craig, Limited, P. S. Brownlie & Co., the Shawsrigg Fireclay and Enamelling Company, Limited, the Glenboig Union Fireclay Company, Limited, W. Stevenson & Co., David King & Sons, James Milne & Son, Limited, McDowall, Steven & Co., W. B. Morrison & Sons, Smith & Saunders, J. L. Arnot, W. Ross & Sons, James Pyle & Co., Dugald McCallum, W. P. Buchan, R. Boyle & Son, Limited, Moses Speirs & Sons, the British Sanitary Co., Thomas Robertson & Co., Robertson & Co., J. Stott & Co., George Low, John Scott, Thomas Gardiner, A. B. Campbell and the British Illuminating Company.

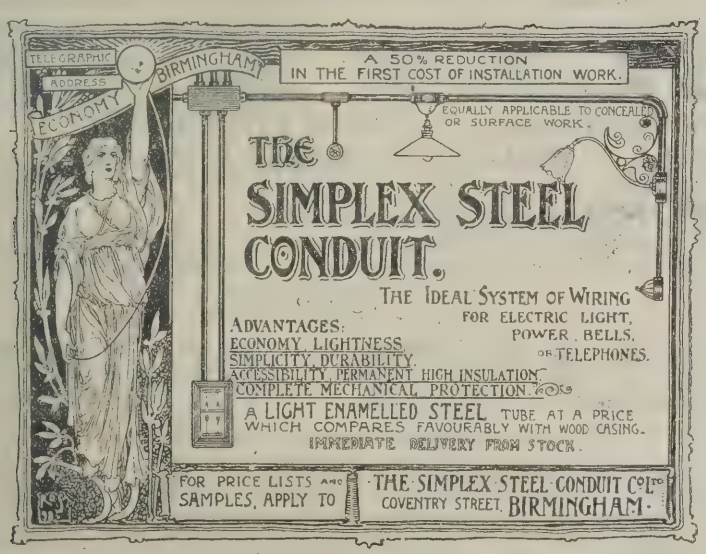
THE "IDEAL" SANITARY ENAMELLED WROUGHT-IRON SINK.

THE above illustration gives a clear idea of the new sink which is being placed on the English market by Messrs. Orme, Evans & Co., of Wolverhampton. It is made of wrought-iron, enamelled white inside and French grey outside, and the advantages claimed for it are lightness and cleanliness, as the bracket by which it is attached to the wall obviates the necessity of the supports in ordinary use, which provide ample accommodation and space for the accumulation of filth. This style of sink has attained great popularity in America, and no doubt it will succeed here equally well when adequately made known to English architects, especially as it is inexpensive.

HEALTH EXHIBITION, DUBLIN.



THE principal object of the exhibition which was held this week in Dublin in connection with the congress of the Institute of Public Health, was to give the public an approximate idea of the giant strides in sanitary matters which have been made during the fourteen years which have elapsed since the last show of a similar kind was held in that city. It was also intended to enable inventors and manufacturers to show by practical demonstration how they have kept time with the onward march of science, and to instruct the mass of the people in the most approved and scientifically conceived methods for promoting public health. The executive committee were fortunate in obtaining so suitable a building for their purpose as that which was placed at their disposal by the Senate of the Royal University. It is centrally and conveniently situated, and afforded ample room for the disposal of the exhibits.

The exhibits were arranged under well-defined heads. There were ninety stands set up in the grand entrance-hall, the main hall and the sanitary hall. There were about a hundred exhibitors, thirty-seven of whom were Irish, and the chief centres represented were Dublin, London, Birmingham, Kircaldy, Leeds, Limerick, Glasgow, Scarborough, Macclesfield, Cleckheaton, Blackpool, Belfast, Sheffield, Copenhagen, Exeter, Hull, Oldham, Hanley, Heckmondwike and Newcastle. Of these there were, of course, many in which our readers cannot be expected to feel any special interest. But among those exhibits which merited attention from a technical point of view were those of some well-known firms. The following may be mentioned :—

Messrs. Kerrill & Hunter's patent improvement in closets and cisterns, which has for its object the utilisation of the powers of pressure of water for ventilating purposes, without any waste of water other than will flush the cistern.

Messrs. Dobson & Curtis Bros. sent examples of electric cooking apparatus, electric medical apparatus, and improved sanitary mural decorations. Examples of tiled panels, stained glass, floor coverings, door furniture and artistic brass work were also shown.

Messrs. James Stott & Co. exhibited a model showing an improved system of warming and ventilating as applied to public buildings, such as asylums, hospitals, schools, theatres, &c.

"THE BANQUET."

"THE GOLD MEDAL RANGE,"
With Lifting Fire.

WORKS, ROTHERHAM. Estab. 1854.

The British Acetylene Gas Generating Company showed generators for country houses, churches and all buildings requiring pure light.

The Eagle Range and Foundry Company showed a 5-foot double oven tiled Eagle range, with improvements, and others of different sizes.

Messrs. Boileau & Boyd had a display of sanitary paints (non-poisonous), specially manufactured from non-poisonous pigments and particularly adapted for the interior decoration of public halls, hospitals, asylums and private residences.

Messrs. William Martin, Son & Co. had on exhibition a choice collection of art sanitary wall-papers, decorations of British and Continental manufacture, stained glass work, encaustic tiling, ventilators, &c.

Messrs. Musgrave & Co., Belfast, had some good examples of Lanyon's patent cheerful ventilating stove in action. These stoves are devised to ventilate the rooms while they warm them. They draw the vitiated air from the room, passing it through the fire and replacing it with pure warm air in considerable volume.

The Oxygen Sewage Purification Company, Limited, of No. 1 Suffolk Street, showed a variety of drawings of works at Northallerton dealing with 100,000 gallons of sewage daily by the oxygen system of sewage purification, drawings of installation at the Dublin Metropolitan Police Barracks, Chapelizod, automatic working machine (patented) for distributing "oxynite," the precipitant used in the process of purification. This machine is automatically set in motion by the flow of sewage and enables a fixed quantity of precipitant per gallon to be added to the sewage as it enters the tank.

Mr. Thomas W. Little exhibited a very superior collection of high-class goods in sanitary construction and in steam and hot water cooking and heating appliances, hospital fittings, &c.

Mr. M'Donnell made an interesting exhibition at stand No. 63 of a number of articles necessary to the construction of sanitary works. They included a set of underhand wiped joints which showed the competent manner in which the work is performed by the exhibitor.

Mr. J. F. Keatinge had a bathroom in complete working order, a large parlour bath and lavatory, with nickel-plated *fin de siècle* fittings, &c.

Mr. Boulger, hydraulic gas and water engineer, exhibited baths, lavatory appliances, ventilating fixtures, cisterns, &c.

Messrs. J. Wright & Co., Limited, had gas cooking stoves on exhibition.

Messrs. Edmundson's Furnishing and Engineering Company, Limited, showed acetylene gas-burners and oil occulting light for beacons and buoys. In the grounds also they exhibited the Gimbal arrangement and Wigham's patent oil lamps, with reflector and occulting apparatus, to burn thirty days without attention.

The Sunlight Gas Company had at Stand No. 92 an acetylene gas apparatus and a generator and model apparatus.

The N. A. P. Window Company, Limited, had an interesting exhibit, consisting of sliding windows, with patent N. A. P. weightless frame fitted with sliding and revolving sashes, and also wood and metal casements opening both outwards and inwards, passable hopper cheeks, air-tight centres and concealed stays, &c.

WORKING-CLASS DWELLINGS IN DUBLIN.

In the course of his address as president of the Congress of the Institute of Public Health Sir Charles A. Cameron, medical officer of health for Dublin, gave the following information about the efforts which have been made in that city to improve the condition of dwellings for the working classes :—

The improvement in the viability of the working classes which has taken place within the last thirty years is to some extent due to the better dwellings provided for them. Owing to the benevolence of the late Mr. Peabody, Lord Iveagh and other philanthropists a considerable number of healthful dwellings have been built for artisans and labourers. A still larger number have been erected by companies, some of which have been founded on semi-philanthropic, semi-commercial lines. In this city and its suburbs the Dublin Artisans' Dwellings Company own dwellings occupied by 2,194 families, who pay from 1*s.* 9*d.* to 12*s.* per week. This company is now constructing 188 additional dwellings.

The City and Suburban Artisans' Dwellings Company have provided dwellings for 284 families, who pay from 2*s.* 6*d.* to 6*s.* per week ; the Industrial Tenement Company own a block of buildings in which there are forty-six separate tenements, let at from 2*s.* to 4*s.* per week. Many employers of labour, such as railway companies, brewers, distillers, &c., have erected improved dwellings for their employés.

Fourteen years ago I suggested to the Corporation the desirability of putting in force the provisions of the Housing of the Working Classes Acts. The suggestion was acted upon, and at the present time the Corporation have provided 375

PRICE LIST AND ESTIMATES ON APPLICATION.

PATENT

VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,

28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.

Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

separate dwellings, let at the following rents :—25 from 6*s.* 6*d.* to 10*s.* (with shops), 12 from 4*s.* 9*d.* to 5*s.* 6*d.*, 84 at 4*s.* 6*d.*, 98 from 3*s.* 6*d.* to 4*s.*, 98 from 2*s.* 6*d.* to 3*s.* 3*d.*, 47 at 2*s.*, 14 at 1*s.* 9*d.* and 23 at 1*s.* 6*d.*

Although so much has been done in providing improved dwellings for the working-classes, the vast majority of them are still lodged in wretched tenements. A few years ago I had a kind of census taken of the city, and found that 32,000 families were located in about 7,000 houses, affording one and a half room per family. On the other hand, the remaining 22,000 families of the city occupied 17,000 houses.

Whilst much has been accomplished in the way of providing proper dwellings for artisans and the better class of unskilled workers, practically nothing has been done to improve the miserable state of the homes of the very poor. In every large town there are, exclusive of beggars, thieves and vagrants, &c., many honest people whose precarious earnings barely suffice to keep body and soul together. Amongst this class are to be found small dealers, pedlars, hawkers, charwomen, rag-pickers, night watchmen, the inferior class of seamstresses, porters and labourers, the miserable creatures carrying placards termed "sandwich-men," and men and women engaged in many other poorly remunerative employments. Beside these there are the dull-witted and the physically feeble people, who are only capable of earning the merest pittance.

It is in the wretched homes of these poorest of the poor that the seeds of fever are developed as in a hotbed. Their dwellings are a peril to the whole community, for their inmates carry contagious matter into the streets, shops, factories and other places. The effluvia from them taint the atmosphere, in the purity of which all are interested. It is the dwellings of the very poor that demand nearly all the attention of the sanitary inspector. He finds it almost an impossibilty to get their owners—who are often nearly as poor as their tenants—to keep them in even moderately good condition.

Since 1879 more than 3,000 houses have been de-tenanted and closed in Dublin on account of their insanitary condition. Of these not one-half have been rebuilt or rendered fit for human occupation. The closing of insanitary houses and the clearing of unhealthy areas have, however, been of little benefit to the poorest of the poor. The people who lived on the unhealthy areas have not returned to occupy the neat dwellings which replaced their wretched tenements. The rents of the new dwellings were beyond their means. The unhealthy areas have been cleared, but the condition of the people who dwelt on them has remained unchanged. They have sought on other areas low-rented tenements as insanitary as those from which they had been ejected.

If all the lowest-rented and consequently least sanitary of the Dublin tenement houses were compulsorily closed, where, save in the workhouse, could their inmates obtain shelter?

I feel convinced that the ordinary landlords of tenement houses, the majority of whom are leaseholders only or yearly tenants, cannot provide proper dwellings at from 1*s.* to 2*s.* per week, the rent which the very poor can only afford. Dwellings so low rented can only be provided by the municipality, or by philanthropic societies and individuals. They will pay very little if any interest on the money expended on their erection and maintenance, but every unhealthy dwelling which they replace will be a distinct gain to the whole community. The replacement of unhealthy by healthy habitations means less illness, longer duration of life and diminished pauperism.

It may be said that if you give a dwelling to a man at less than its market value you pauperise him. To this it may be rejoined that children are not pauperised by receiving their education free; the students in the State-endowed colleges and universities are not pauperised by acquiring not merely a general education but money-making professions chiefly at the cost of the taxpayers. We already give the poor medical advice and medicine gratis; let us go a step further and provide the most dependent of them with dwellings in which they can live under reasonably healthy conditions.

An attempt is now being made to raise a sum of money sufficient to erect a block of tenements, which it is proposed to let at from 1*s.* 6*d.* to 2*s.* per week. It is to be hoped that generous support will be given to those who are engaged in this meritorious project.

The borrowing powers of municipal authorities are limited to a sum equivalent to two years' valuation of the town for rateable purposes. Thus, if a town were valued at a million of pounds its governing body would be empowered to borrow two millions. When this restriction was placed upon civic authorities the money borrowed by them was expended nearly, if not altogether, on what might be termed unproductive works, such as the paving, sewering and lighting of the thoroughfares, &c. It seems to me to be unreasonable that the money expended by urban authorities in providing artisans' dwellings, baths and washhouses, abattoirs and markets, from which revenues are derived, should be included in the amount authorised to be borrowed. Mortgages on these buildings as well as the security

of the rates are required by the Treasury for loans granted in connection with them. It is evident that as the loans for the erection of artisans' dwellings are to be placed in the same category as loans for sewers and other non-revenue producing works, the power of municipal authorities to provide dwellings for the working classes must be extremely limited. It is to be hoped that this disability will soon be removed.

The market value of the artisans' dwellings in the possession of the sanitary authorities should be ascertained and the sum found added to the amount allowed to be borrowed on the two years' rateable valuation system. Thus, if a corporation could borrow a million for unproductive purposes, and it possessed artisans' dwellings valued at 100,000*l.*, then its borrowing powers should be extended to 1,100,000*l.*

In the abatement of nuisances, involving structural alterations in a dwelling, the expense has frequently to be defrayed by persons having little or no interest in the benefits derived from the structural alterations. In order to prevent this injustice, as it may be termed, an amendment of the Public Health Acts of both England and Ireland is necessary. The cost of private sanitary improvements insisted on by the sanitary authority is borne by the person who receives the rack-rent of the premises. The definition of rack-rent in the English Public Health Act of 1875 is not so simple as that of the Irish Act, which defines it to be two-thirds of the rateable valuation of the premises. Thus, if a landlord lets a house for 60*l.* a year which is valued at 40*l.* he receives a rack-rent, and must pay for the cost of sanitary improvements, although he may have let the premises on lease for 999 years. In such a case as this surely it is the leaseholder who ought to pay for the improvements, as he alone enjoys them.

A curious point in connection with private improvement expenses is the liability of the person who receives rent from the occupier for the cost of the improvements, although he himself may pay a rack-rent. He is termed the "immediate" rack-renter. I know of a case where a person who paid 80*l.* a year for a house valued at 75*l.* was obliged to sublet it for 60*l.* in consequence of depreciation of house property in the street. Although losing 20*l.* a year by the house, he was obliged to pay nearly 50*l.* in providing it with improved drainage and sanitary arrangements, whilst the landlord, who received 80*l.*, was by law exempt from contributing to the expense of the improvements. It seems only fair that every person having a beneficiary interest, present, proximate, or remote, in a house, should be obliged to contribute to the expense of its improved sanitation, the proportion to be determined by the magistrate who makes the order for carrying out the improvement.

EMPLOYERS' LIABILITY.

In the City of London Court, before Mr. Commissioner Kerr and a jury, the case of Mabey *v.* Colls came on for hearing. It was an action brought under the Employers' Liability Act by Thomas Mabey, a carpenter and joiner, against his former employers, Messrs. Colls & Sons, builders, of Coleman Street, E.C., to recover 350*l.* damages for personal injuries sustained in consequence of the defendants' alleged negligence. It appeared that the plaintiff was one of a number of workmen employed by the defendants, on March 8 last, to effect certain alterations at a house known as 10 Brook Street, Grosvenor Square. His case was that, while he was cutting away a joist in a room on the ground-floor in accordance with instructions received from the acting foreman, a plank of wood fell upon him from a scaffold above and caused injuries which, according to the medical evidence, were likely to be of a permanent character, and to prevent him following his occupation in the future. The negligence complained of was that the scaffolding was improperly constructed, and expert evidence was called to show that it was impossible for a board to fall, as this one had done, from a properly constructed scaffold. The defendants denied all knowledge of the accident, and said that the only scaffold of the height described by the plaintiff was in the hall, and that was properly constructed and "close boarded." The jury, however, found for the plaintiff, and awarded him 50*l.* damages. Judgment was entered accordingly, with costs.

CONCILIATION COUNCILS IN MILAN.

The Conseils de Prud'hommes form one of the most useful of French institutions. They consist of elected members such as manufacturers, merchants, managers, foremen and workmen, and endeavour to effect arrangements in trade disputes. According to the British Consul an effort has been made to acclimatise the prud'hommes in Italy. He writes:—

An experiment of a system for the settlement of disputes between employers and employed is now being made in the province of Milan, and as all questions affecting the relations

between capital and labour must have an interest for the United Kingdom, I make no apologies for giving a detailed description of the scheme.

In 1893 a law was passed authorising the creation of colleges of probiviri or prud'hommes in the industrial districts of the kingdom. I must use the word "probiviri," for, as will be seen, the functions of these persons are not limited to arbitration, and consequently the term "boards of arbitration" would not be sufficiently comprehensive.

The law, as regards the Government, is permissive in its character, inasmuch as the time when and the place or places where it shall be applied, are left to the discretion of the Minister of Commerce. It was not until 1897 that it was decided to give it a practical application on a large scale, and the province of Milan was chosen as the field for the experiment. In the autumn of last year a Royal decree was issued creating seventeen districts in this province, and ordering that the elections should take place last December.

The districts formed represent all the most important industries and trades, and are made up as follows :—(1) Metallurgical, mineral and mechanical industries ; (2) chemical industries; (3) building and other industries connected therewith; (4) brick, cement, lime and glass-making industries; (5) industries and trades connected with the manufacture and sale of articles of food; (6) tanning and leather industries; (7) industries connected with gold and silversmiths and hardware manufacturers; (8) graphic and paper arts and industries; (9) carrying trade and everything connected with it; (10) hat and cap manufacturing industry; (11 and 12) cabinet-making and carpentering industries; (13 to 17) textile industries.

A centre of each particular industry or trade is chosen as the headquarters of the electoral district, and different sections are grouped round it in which the electors may record their votes. Districts 1 to 9, 11, 16 and 17 have their headquarters at Milan, 10 and 12 at Monza, 13 at Abbiategrasso, 14 at Busto Arsizio and 15 at Gallarate. The elections are by ballot, and must all take place upon the same day ; the returning officers in each section must be either a magistrate or a municipal councillor. The communal authorities in each section are required to prepare the electoral lists of the respective industries, and these lists must be two in number, one composed of employers, directors and managers, and the other of operatives. To be inscribed as an elector it is only necessary to be an Italian subject of full age (twenty-one years), in the full enjoyment of civil rights. In the case of the operatives it is required that they shall have exercised their special industry or art for at least a year, and that they shall have resided in the district for a period of not less than six months. Women enjoy the same electoral rights as men.

Every qualified elector is also eligible for election, provided he be twenty-five years of age and can read and write. The electoral lists must be revised every year in March.

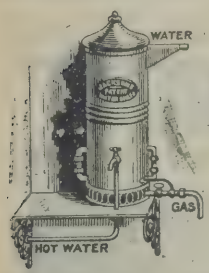
Each college of probiviri must consist of not less than ten and not more than twenty members, one-half of whom are elected by the employers from among themselves, and the other half by the operatives from among their own number.

In addition to the elected members each college is provided with a president, and, if necessary, a vice-president or a deputy-president, who are appointed by the Government, and who must be already in office when the elections take place.

The presidents and deputy-presidents are required, on assuming office, to take the oath which is administered to ordinary magistrates, and the elected members are required individually to make to them a solemn declaration that they will honestly and fearlessly exercise the functions entrusted to them. None of the members of the college of probiviri receive any remuneration or indemnity. On the assembling of the probiviri their first business is to elect two vice-chairmen. These are chosen by ballot, the one representing the employers being chosen by the operatives and the one representing the operatives by the employers. When the college is thus legally constituted, it must elect from among its own body a committee of conciliation consisting of at least two members, one representing each party. This committee, in the absence of the president or deputy-president, may be presided over by one of the vice-chairmen in turn. A jury consisting of four members, two from each side, must then be chosen. The jury can only exercise its functions under the presidency of the president or deputy-president.

The duties of secretary are to be discharged either by the municipal secretary or by some other employé of the municipality in which the college has its headquarters.

All questions arising under the following heads are to be submitted to the committee of conciliation.



(*a*) Wages disputes.

(*b*) Disputes as to pay due either for work already executed or in actual process of execution.

(*c*) Disputes respecting hours of labour.

(*d*) Special conditions of work.

(*e*) Work imperfectly executed.

(*f*) Compensation to be allowed for changes made in the quality of the raw material supplied or in the mode of working.

(*g*) Questions relating to damage done to plant or machinery by operatives, and injuries sustained by operatives owing to the fault of the employers.

(*h*) Questions relating to compensation due by an operative for leaving his work, or by an employer for dismissing an operative without sufficient notice or before the completion of a job.

(*i*) Questions relating to the breaking of contracts of work or apprenticeship, and in general all controversies arising out of contracts between employers and operatives, or between skilled workmen and apprentices.

The law establishes that no case referring to any of the above matters can be taken before any tribunal unless it has previously been submitted to the committee of conciliation of the particular trade or industry with which the parties are connected.

When the efforts of the committee of conciliation have failed to bring about a settlement, then the intervention of the jury or that of the ordinary tribunals may be sought, but either of the parties has the right to require that the procès-verbal of the proceedings before the committee of conciliation, together with an expression of opinion on the part of the committee itself, be laid before such other tribunal.

In cases in which an operative has accepted the solution proposed by the committee of conciliation, and has been compelled, by the refusal of the employer to accept the same, to go to law, the operative is entitled to be provided with legal assistance gratuitously.

All cases which have been before the committee without a settlement being arrived at may, if they are contemplated by the preceding articles (*a*), (*b*), (*d*), (*e*), (*f*), (*g*), (*h*), and (*i*), and if the amount of money involved does not exceed 8*l*., be submitted to the jury. The decisions of the jury have the force of law, and can only be appealed against on the ground either that the case was not within the competence of the jury, or that the jury had exceeded its powers. Exceeding its powers is laid down to mean either that it has pronounced itself on a matter which had not been submitted to its judgment, or that it has granted more than was asked of it.

The jury has power to summon witnesses and examine them on oath, and in certain cases to indemnify them for their expenses.

The losing litigant is called upon to pay the costs, which, are, however, on such a very limited scale that practically justice may be said to be administered free by the probiviri, and the State renounces its claim to the stamp with which ordinary legal proceedings are burdened.

The costs, such as they are, are handed over to the Chamber of Commerce of the district, while the said chamber, on the other hand, has to bear all expenses connected with the elections and the working of the colleges of probiviri. As Chambers of Commerce in Italy are, to a certain extent, Government institutions, and are allowed to levy a tax on all persons engaged in commerce or trade, they have ample means wherewith to meet the charge thus thrown upon them.

Suitable accommodation for the meetings of the probiviri must be provided by the different municipal or communal authorities, in buildings belonging to them.

The elections took place at the end of December; the number of voters was relatively very small.

The new institution is regarded, if not with enthusiasm, at least without hostility by the employers, and will no doubt be warmly supported by the operatives when they come to realise all that it means for them. The Socialist leaders have already taken the matter up, and quite recently they held a public conference for the purpose of explaining the working and the advantages of the new law. I was present at the conference, and from the questions put to the lecturer at the close of his lecture by many operatives, I was able to judge of the intelligent interest they are already taking in the measure. All the criticisms were made in a very benevolent spirit.

The new law is not applicable to persons engaged in Government dockyards, arsenals, factories, &c.

Although the law has only been in operation for a very short time, I hear that several disputes have already been satisfactorily arranged.

BIRMINGHAM SANITARY CONGRESS.

THE programme of the local arrangements for the forthcoming congress at Birmingham of the Sanitary Institute has now been definitely settled. For the convenience of visitors attending the congress the general reception-room will be in the Town Hall. The conferences and sections will be held in the Mason University College, and the lecture to congress and the closing general meeting will also take place within the same building.

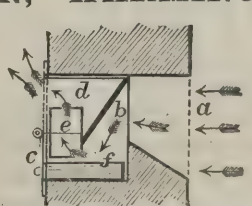
The President's inaugural address and the popular lecture will be delivered in the large lecture theatre of the Birmingham and Midland Institute, and the Council Chamber will be used for the reception of members of the congress. The formal reception by the Lord Mayor of the members will be made at half-past twelve o'clock on Tuesday, September 27. For an hour later a public luncheon has been arranged at the Grand Hotel; and in the afternoon the president (Sir Joseph Fayrer, Bart.) will deliver his inaugural address. In the evening there will be a large attendance at Bingley Hall, when the Lord Mayor will open the Health Exhibition. On the following day the members will settle down to business, and devote six hours to conference work. One section, over which the Lady Mayoress will preside, will deal with the important subject of "Domestic Hygiene." This conference is open to all ladies interested in the work. In the evening the Lord Mayor will give a conversazione and reception in the Council House. The sectional meetings (three in number) commence in Mason College on the Thursday. The first will be devoted to the study of "Sanitary Science and Preventive Medicine," and will be presided over by Dr. Alfred Hill (city medical officer). "Engineering and Architecture" is the title of the subject in Section II., at which Mr. W. Henman will preside, and in the third section discussions will take place having relation to "Physics, Chemistry and Biology." This meeting will be held in the Biology Theatre, and the chair occupied by Dr. G. Sims Woodhead. In the afternoon the whole of the members will reassemble and attend, at the invitation of the chairman (Alderman Cook) and members of the health committee of the City Corporation, a garden party at the Botanical Gardens, Edgbaston. The same night Dr. Christopher Childs (lecturer on bacteriology in relation to hygiene at University College, London) will deliver a lecture to the congress. Friday, which concludes the practical part of the congress, will perhaps be the busiest day. The papers and discussions opened in the sections on the previous day will be continued. In the afternoon excursions will be made to Dudley Castle and the Wren's Nest, the Whitacre pumping station and filter beds, and Shustoke reservoirs and the Saltley sewage farm. At the respective places tea will be provided by the Earl of Dudley in the courtyard of the castle, Alderman Lawley Parker (chairman of the water committee), and Alderman Baker (chairman of the Tame and Rea district drainage board). The closing general meeting of the congress is arranged for five o'clock, and at half-past eight Dr. Alec Hill (master of Downing College and vice-chancellor of Cambridge University) will deliver a popular lecture. The chair is to be taken by the Lord Mayor. Saturday, on which day the congress terminates, will doubtless be interesting and enjoyable, excursions having been arranged for Stratford-on-Avon and Warwick, Malvern and the Croft Granite, Brick and Concrete Company, Leicester. At Stratford-on-Avon various places of public interest will be visited, including Shakespeare's birthplace and the Shakespeare Memorial buildings. The journey will then be continued to Warwick, where at the Court House in the afternoon the members will partake of the hospitality of the mayor (Councillor Glover). His worship will act as conductor of the party at Warwick Castle. The visitors to Malvern will inspect the Abbey, British camp, sewage farm and waterworks. At the invitation of Earl Beauchamp and other residents, the members will take tea at the Imperial Hotel. Similar refreshment will also be provided at the Croft works by the directors of the company.



The local general committee, of which the Lord Mayor is the chairman, have made arrangements that members may visit the public institutions of the city and a number of manufactories. The latter include Messrs. S. Allcock & Co., Redditch (manufacturers of fish-hooks, tackle, &c.); the Birmingham Small Arms Company (gunmaking), the Birmingham Electric Supply Company (power station), Messrs. Brinton, Kidderminster (worsted-spinning and carpet-making); Messrs. Cochrane & Co., Dudley (bridge and engineering work); Messrs. J. Cartland & Co. (brass-foundry and art-metal work), Birmingham Sewage Interception Department, Windsor Street Gasworks, the Dalton Street power station of the water department, the Central Fire Station, the Bradford Street Meat Market, Messrs. A. R. Dean (furnishers and decorators), Messrs. Elkington & Co. (electro-plate and art work), Messrs. J. Gillott & Sons (steel pen making), Messrs. F. & C. Osler (glass blowing and cutting), Messrs. Osmund (cycle-works), Messrs. Perry & Co. (pen-making), the Webley & Scott Revolver and Arms Company, the Guardians of the Birmingham Proof-house (testing of guns and all parts of small-arms), Messrs. J. Hardman & Co. (stained-glass painting), Messrs. A. Hickman, Limited, Bilston (pig-iron and steel making by the basic process); Messrs. Icke & Sharp, Limited (manufacture of confections); Messrs. Middlemore & Lamplugh (curriers' work, &c.).

In the reception-room ample arrangements have been made for the convenience of the visitors, and a special rate has been

agreed upon by the railway companies for the conveyance of visitors within fifty miles of Birmingham. As will be observed, no effort has been spared by the local committee to make the visit to Birmingham a thoroughly successful one, and there seems no reason why this result may not be confidently expected.

ALHAMBRA THEATRE, BLACKPOOL, AND ANCIENT LIGHTS.

At a vacation sitting in Liverpool, on the 23rd inst., of the Chancery Court of Lancashire, the deputy vice-chancellor, Mr. W. F. Taylor, had before him an application in connection with a new theatre which is being erected at Blackpool. The plaintiffs were Messrs. William Rhodes & Sons and Messrs. Young & Rhodes, and they asked for an interim injunction restraining the defendants, the Alhambra (Blackpool), Limited, from erecting their theatre to such a height as to interfere with the plaintiffs' ancient lights. Mr. Mansfield and Mr. Cunliffe were counsel for the plaintiffs, and Mr. Roby appeared for the defendant company.

Mr. Mansfield said the plaintiffs asked that the defendants be restrained from continuing the erection of the building further than what it was at the date of the writ. The plaintiffs were lessees of premises in Bank Hey Street, which was a very narrow thoroughfare. The defendants were erecting a new theatre called the Alhambra, and the back of the building ran into Bank Hey Street opposite the shop occupied by the plaintiffs. Prior to the erection of the theatre the site was occupied by the Prince of Wales Baths, and these only went to a height of about 44 feet, but the new building had been already carried to a height of about 77 feet, and interfered materially with the plaintiffs' light. The plaintiffs could not interfere with the building so far as it had gone, but the defendants were increasing the height, and the theatre was apparently to go very much higher. At one part a sort of dome was to be erected, and when that was put up there would be absolutely no sky to be seen from the plaintiffs' shop windows, either from the bottom or first floor.

The Deputy Vice-Chancellor: The defendants say they have finished the wall.

Mr. Mansfield: They say so, but we say they have not. So far as the building had gone at the present time he could not, on an interim injunction, ask that it come down, but he asked for an order to prevent the defendant company carrying the building any higher than it was now until the trial of the action.

Mr. Roby said the only possible object the plaintiffs could have in commencing this action the day after the beginning of the long vacation was to make the defendants come to terms with them at once, or otherwise an injunction might be granted which would prevent them putting the roof on and save this costly building from being entirely destroyed. It seemed perfectly hopeless that this action could succeed. Counsel read an affidavit from Mr. Oswald K. Wilson, the architect, stating that so far as the height was concerned the building was virtually finished.

The Deputy Vice-Chancellor said he would make an order that the motion stand over till the trial of the action, when everything would be open to both parties. Anything done between now and the trial would be done by the defendants at their own risk.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

17140. Theophil Pfister, for "An improved manufacture of mosaics, tiles, bricks and the like."

17141. Theophil Pfister, for "Improvements in cloisonné work and mosaics."

17280. Sigmund Bergmann, for "Improvements in electrically driven fans or ventilating devices."

17339. William Longmore, for "Draughtless automatic ventilator."

17344. Max Holyer, for "Improvements in artificial fountain apparatus."

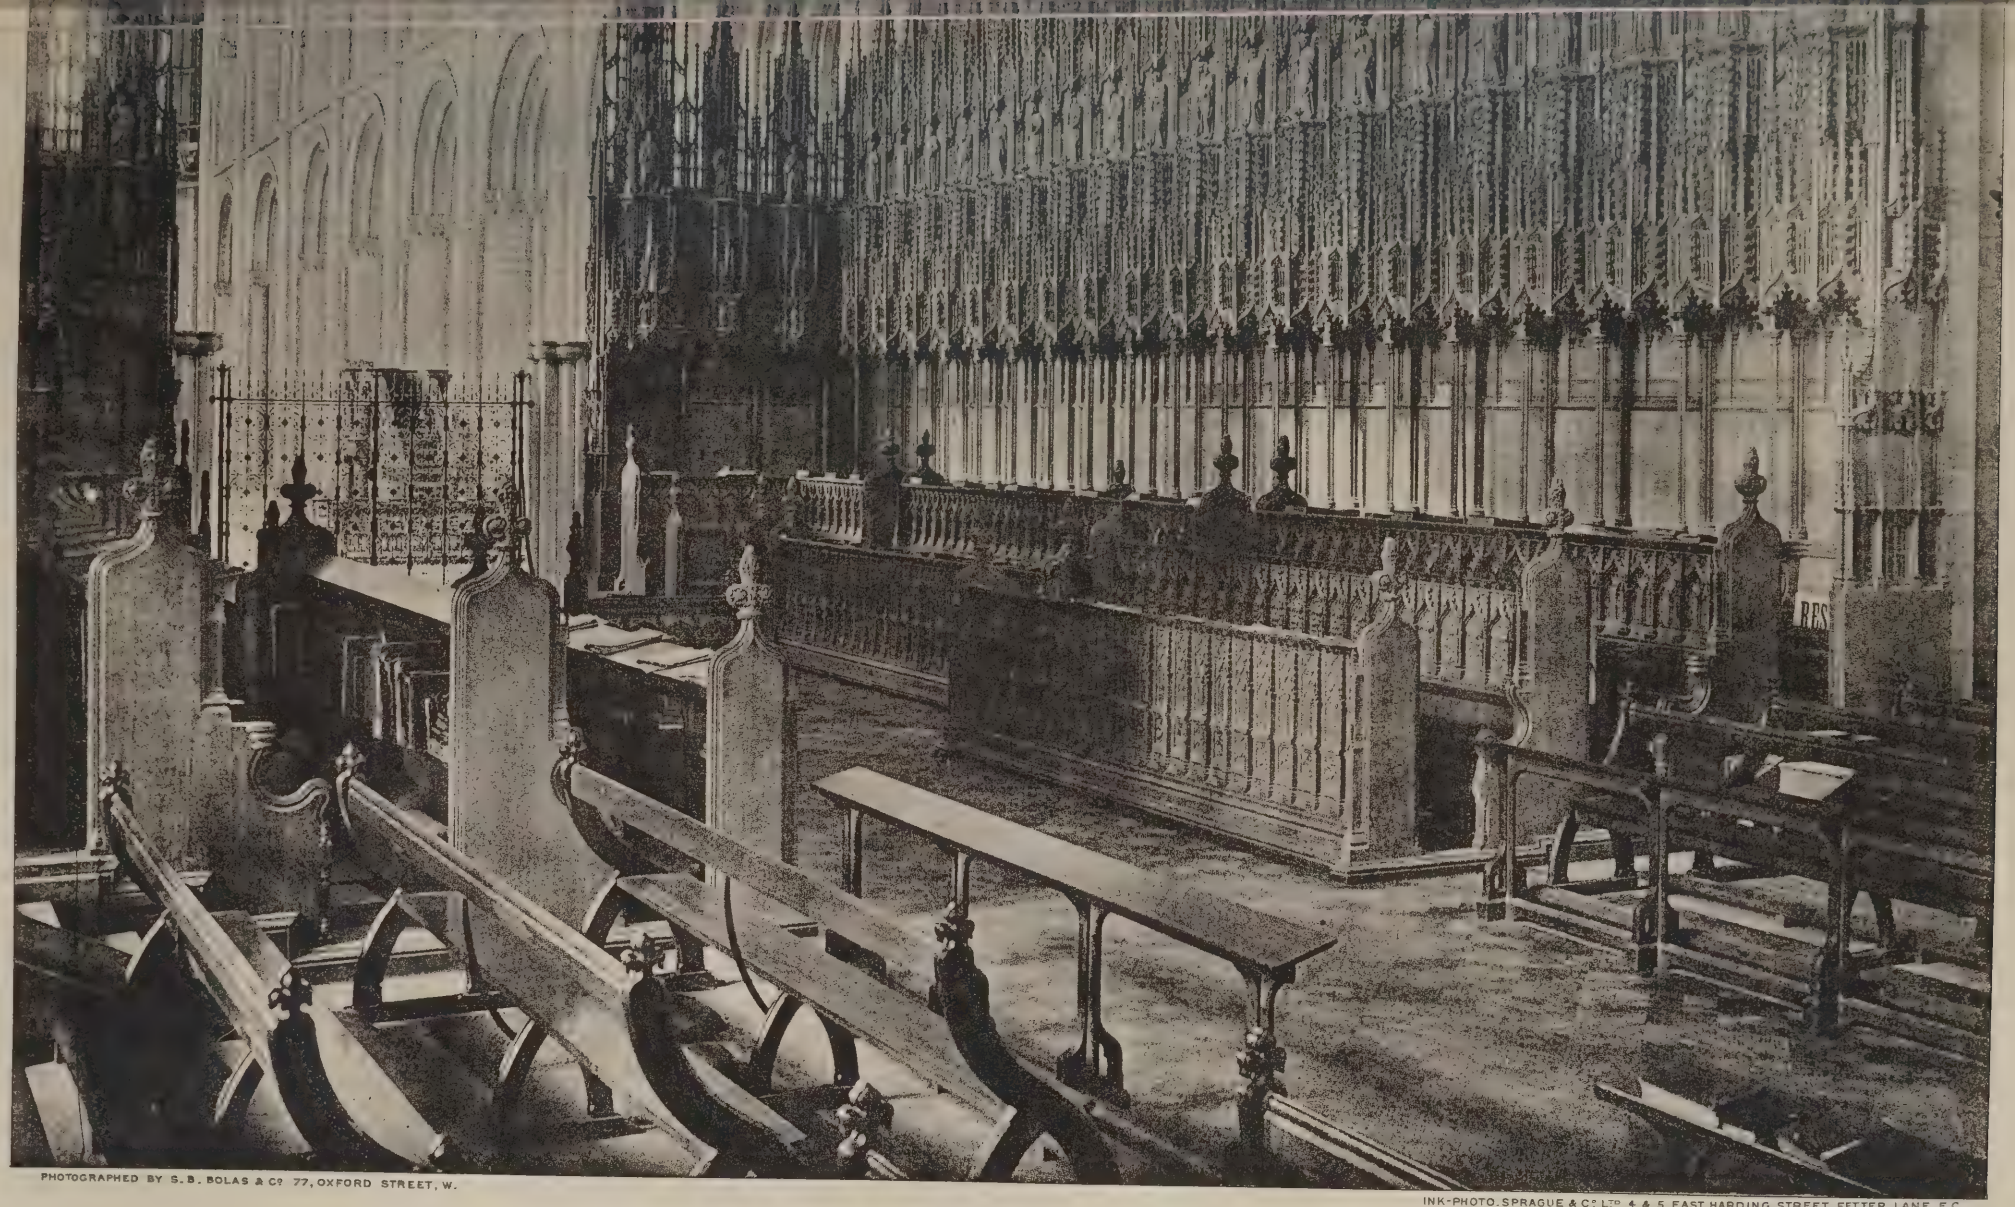
To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—The Lady's Pictorial.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—The Stage.



"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—The Gentlewoman.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

The Architect.

THE WEEK.

THERE is no firm in the iron trade better known and respected than that of NEWTON, CHAMBERS & Co., LIMITED. It is with regret we learn of the almost sudden death of the managing director, Mr. ARTHUR MARSHALL CHAMBERS, at Scarborough on Monday morning. To his business qualities much of the success of the company was owing, and the title of it is familiar throughout the land. There can be no doubt that his end was hastened by the harassing work which fell on him a few years ago when he acted as chairman of the employers' federation in the coal strike. The duties he discharged became more onerous because he could not be assured with all his striving of any hope of victory. But he earned the respect of those who were best able to judge of his energy, courage and devotion to principle. The calls on him as managing director of so important a firm were more than enough to occupy his time, but in the district of Chapelton, where he was engaged, and the neighbouring Sheffield, he took upon himself many public duties, and his death leaves a void which will not easily be filled. Mr. CHAMBERS was in his fifty-fifth year.

COMBINATIONS of words which at one time are offensive, at another time can be taken as flattering. All depends on the spirit which inspired them. The late Mr. AYRTON, who was considered by his leaders to be an ideal Commissioner of Works, caused much irritation by classing artists with market-gardeners. A few days ago Lord KELVIN did the same, but those who heard or read the words were pleased. The occasion was a flower show, which his lordship treated as an exhibition of works of art. Lord KELVIN admitted that some of the visitors present might not quite approve of his calling the exhibits works of art, but he felt it was as much of that nature as an exhibition of pictures in the Royal Academies of London or Edinburgh, or the Art Galleries of Glasgow. If they walked over mountains or places never touched by the hand of man, in tropical jungles or in their native land, they would see works of design, called works of nature, but which all knew to be works of creation. An exhibition of pictures showed the faculty for creative work entrusted to man—man's work lay in producing objects that were called works of art. There was design in art, and there was design in nature, and all designs had one origin. That was not the place to enter into a disquisition as to the meaning of art. Painters and gardeners both were engaged in developing nature. SHAKESPEARE hit that feeling on the head in "The Winter's Tale" as "an art which does mend nature: change it rather, but the art itself is nature." Nature and art met in the brilliant display of colour and beauty they had in flowers. The identifying of art with nature is the more remarkable as coming from a physicist like Lord KELVIN, who is so exact in language, he would if he could employ only mathematical formulæ to express thoughts.

THE Commissioners for the Exhibition of 1851 have been granting during the last five years science research scholarships of the value of 150*l.* a year. Generally they are held for two years, but some are renewed for a third year if it is expected that the result will have scientific importance. The governing bodies of the universities and certain colleges can recommend candidates who are known to have studied some subject scientifically for a period of three years. During the five years seventy-nine scholars were appointed. It appears that thirty-nine of them are engaged in the teaching of science, twenty-six have obtained engagements with manufacturers or in public departments, or are following a professional career; the remainder are nearly all still engaged in study or in private research. In some cases the students' reports on the work they have performed have not satisfied experts, but the Commissioners cannot believe that in such cases the scholarships have been devoid of results. In order to obtain a further test the Commissioners have written letters to the manufacturers where the scholars were employed, and to the governing bodies of the institutions where the researches were carried on, asking them whether the services of the scholars have been increased to an extent corresponding with the opportunities of improvement afforded. As a rule the answers received have recognised the great benefits which scientific education has derived from the scheme. Accordingly, it has been decided to invite the following institutions to recommend science scholars for 1899:—University of Edinburgh; University of Glasgow; University of St. Andrews; Mason University College, Birmingham; University College, Bristol; Yorkshire College, Leeds; University College, Liverpool; University College, London; Owens College, Manchester; Durham College of Science, Newcastle; University College, Nottingham; University College, Sheffield; University College of Wales, Aberystwyth; University College of North Wales, Bangor; Queen's College, Belfast; McGill University, Montreal; Queen's University, Kingston, Ontario; University of Sydney, and University of Melbourne.

THE allusions to architecture in the works of some of the poets formed the subject of several articles by the late E. W. GODWIN and other writers in early volumes of *The Architect*. The aim was to derive from what was said in verse more or less evidence on archæological subjects. It was understood that from not possessing or from a fear of using technical terms the descriptions of a poet must be vague. Law givers like BOILEAU and ADDISON had expressed the well-established doctrine of critics when they condemned the use of words which recalled the workshop or the studio. Consequently poets cannot help being vague when they have to employ several words to do the office of a single technical term. Then when they are ambitious and try to pose as learned they are likely to hold by theories which appeal to their imagination alone. SCOTT, for example, believed that Sir JAMES HALL had discovered the secret of Gothic in the twisting of willows by chairmakers and cradle-makers. WILLIAM MORRIS could claim to have experience of architecture, but as became "a craftsman," his thoughts were with the things he could produce or supply rather than with the architectural whole. BROWNING lived long among Renaissance works, but his weakness for representing the world and all that is in it as topsy-turveydom was fatal to all attempts to describe buildings in which Greek principles are directly or indirectly exemplified. As for TENNYSON and his "clear-walled cities," we must remember it was his duty to sing about exhibition buildings in which glass was the principal material. English poets will be wise to imitate SHAKESPEARE, and avoid architecture as they would mathematics. The art is too austere to raise those emotions which are their province. Mr. STATHAM'S "Architecture among the Poets" (B. T. BATSFORD) probably arose out of a conviction of that kind. At any rate, there is enough in it to serve as a warning to all who with "their scrannel pipes of wretched straw" would attempt to express the melody, the "frozen music," which every great building suggests.

WHEN a special committee was lately appointed by the Gas Commission of Perth to investigate a claim for 112*l.* made by Mr. G. P. K. YOUNG, architect, for fees in connection with the new gas works, it was concluded that some revelations would follow. But their report is altogether in favour of Mr. YOUNG. The committee have considered that the manager was remiss in not ascertaining what Mr. YOUNG'S charge would be for the work, and in not submitting the whole matter in a very complete and careful manner to the convener of the works committee, for instruction before actually employing Mr. YOUNG. They considered that Mr. YOUNG'S conduct in the whole matter had been perfectly straightforward and business like, and the gas commissioners having adopted his plans and specifications, and carried out the work according to them, they could not resist the conclusion that Mr. YOUNG'S account must be paid by the commissioners. They were of opinion that both the convener and manager had acted in a careless, negligent and unbusiness-like way, that they should be censured by the commissioners, and, further, that the manager be cautioned that in the event of his being guilty of similar laxity, or showing want of attention in the performance of his duty as manager, he should be asked to resign. After a long discussion on Monday, the gas commissioners agreed by a large majority to adopt the report.

THE STONE IN OLD BOW CHURCH.

By Harold F. Hills, F.C.S.

MUCH difference of opinion has recently been expressed as to the nature and source of the stone used in the construction of the oldest existing portion of Bow Church (1480-90 A.D.), that Mediæval building in East London which since 1896 has remained closed on account of its dangerous condition, and is now about to be restored.

With a view to gaining, if possible, some conclusive information on the subject, the writer has subjected some pieces of the stone to careful chemical analysis, in order that the composition of a specimen might be compared with the published analyses of the building stones from the various English quarries.

A difficulty has, however, been encountered owing to the fact that even our most modern text-books publish only a few analyses made sixty years ago for the Royal Commission on the Selection of Stone for the Houses of Parliament, and the solitary analysis of Kentish ragstone and hassock made by Phillips for Whichcord's paper on "Ragstone" in 1846.

Careful search through the literature dealing with building stones during the last half-century reveals very few additional analyses, and the comparison cannot therefore be as complete as might be desired.

Nevertheless, the results are interesting, and indicate very strongly that the stone is in all probability Kentish ragstone, as will be seen by the following figures.

Sample.	Weight of a Cubic Foot.	Per cent. bulk of Water absorbed as compared with bulk of Stone.	Silicious Matter.	Carbonate of Lime.	Lime present in other Forms.	Carbonate of Magnesia.	Oxides of Iron and Aluminium.	Water of Combinations and Volatile Matter.	Moisture.	Sulphuric Anhydride (SO_3).
Bow Church, north chancel wall . .	165·8	6·4	7·50	88·75	0·10	1 05	1·80	0·05	0 60	trace
Bow Church, base of tower	168·3	5·0	6·70	86 07	0·40	0·44	2 20	1 60	0·42	0 20
Kentish rag (Whichcord)	166	1·3	6·5	—	92·6	—	0·5	0·4	—	—

No other published analysis compares so closely with the composition of the Bow Church stone as that of Kentish rag quoted by Whichcord, and although the percentage amount of water absorbed by Kentish rag (taken from Rivington's "Notes") appears to be less, this is accounted for by the fact that the Bow Church stone showed signs of decay, and as a limestone decays it becomes more porous.

The Effect of London Air.

In order to ascertain whether the composition of the surface of the stone had been affected by the East London atmosphere, some surface scrapings were taken from the same spot in the chancel wall as the sample of stone previously analysed, and it was found the sulphuric anhydride had risen from a mere trace to 7·78 per cent., while the amount of "volatile matter and combine of water" had risen from ·05 to 2·24 per cent.

These results corroborate those of Dr. Voelcker, who in 1864 showed that house soot contains sulphate of ammonia, and that this sulphate of ammonia converts limestone (carbonate of lime) into sulphate of lime, and stated that in the presence of moisture the sulphate of lime "takes up water of crystallisation, and thereby leads to exfoliation of the stone."

THE BIRTHPLACE OF RICHELIEU.

By J. A. Randolph.

THE town of Richelieu, twelve miles south of Chinon, though possessing railway communication with the main line, is practically unknown to tourists, owing to its position, except by name; but with some who have ransacked the haunts of the Red Eminence, it is known on account of its historical associations as well. Probably those who have visited the place can be counted on one's fingers.

From Chinon, except in the immediate neighbourhood of that delightfully picturesque spot, the country is very uninteresting to the lover of landscape, but an imposing church is to be seen at Champigny, on the way to Richelieu town. Till some years ago it was not certain whether the Cardinal was born in this town or at Paris; and, strange to relate, the "Grand Dictionnaire du XIX^e^ Siècle," by Larousse, in two separate articles, one on Richelieu himself and one on Paris, describes him to have been born in both places. He was, however, born in Touraine, and a town has sprung up alongside the beautiful grounds which contained the château in which he saw the light. That town is unique in several ways. It is entirely planned and designed by one man, Jacques Lemercier, the cardinal's architect, and is, in its entirety, a *monument historique*.

When Richelieu was born in the picturesque château which he afterwards pulled down, with the exception of the room where he was born (in order to preserve it for the admiration of future generations), the place was only a straggling settlement, spiritually directed by the priest of Braye, a village about eight miles to the south-east. In 1631 Richelieu took it into his head that the hamlet was unworthy of his greatness, and obtained the king's permission to carry out great improvements there. He gave instructions to Lemercier to design a small town with all the then latest sanitary arrangements, for erecting at the gates of the family property, whereon he was then engaged in building the château that has been so admirably portrayed by Marot and by Israël Sylvestre. The room in which he was born was still being publicly shown in 1835, when the ruins of the castle just alluded to were pulled down.

The streets of the town were built at right angles to each other, and the main thoroughfares were defended by gates at the extremity of the town, which was surrounded by walls and entrenchments. The king, to encourage people to come and live there, repealed all rates and taxes till one hundred houses were built, from which time onward the taxes were very low—only 200 "livres tournois" for the whole town. Four fairs, each lasting a week, were to be held every year, and bi-weekly markets. The salt tax was repealed—in fact, Louis XIII. did all he could to make things encouraging to the inhabitants to stay there and for strangers to come.

Richelieu, too, bought and exchanged many lands and properties and incorporated them with the town, both materially and financially. He also erected the church and the covered market, a presbytery, the local academy and the town hall, and gave the ground free of all encumbrance, on condition that the houses erected thereon should be according to Lemercier's designs and the surveyor's instructions.

When the town was nearly completed he erected it into a "Duché-Pairie," and secured the privileges attached to the title for his town. Soon after he took the peer's oath in Parliament on behalf of his *protégés*. The King's "Acte" starting this litle town is dated May 1631.

To-day four of the six gates remain standing; one of them is blocked up. The rest of the town is practically as Lemercier left it, only a few modifications of the houses here and there for the insertion of shop-fronts having taken place and the arcading round the square having disappeared. Traces of the arcading against several of the house-fronts of the square can still be discerned.

One of the twin spires of the church was blown down some years ago in a great gale and the other was taken down, presumably to match; but we were informed on our visit there some four years ago, that they were shortly to be restored according to their old design, which is still preserved in the town archives. Twin spires are rare in the seventeenth century, and Jacques Lemercier has made some happy hits in his variations from a cut-and-dried routine of design, thus asserting a wholesome independence.

The town hall has now become a mairie, with a police-court and cells on the ground-floor. It has a mediocre portrait of the Cardinal, two handsome carved and painted doors, and a third door of the same design, much battered and not painted. The ceilings are beamed, and there is a fine stone balustrading to the staircase leading to the municipal offices on the first floor.

In the main street, the Rue de Chinon, from the gate of that name to the Grand' Place there are portes-cochères to every group of two houses, and inside them is a courtyard, on the doorways leading to which, as well as on the inner

arches of the main entrances, are carved inscriptions from the Psalms, in Latin, with number and verse.

The castle grounds are very extensive and well laid out, only a kitchen pavilion of the old château of LEMERCIER standing isolated on the lawn. The moat contains water flowing from the river Mable, and encircles the island on which the main part of the château stood, the shape of which is small, but perfectly distinct, the moat walls of the château foundations being kept clear and level with the ground. The space enclosed thereby is thickly planted with shrubs, growing freely, and beautiful flowers.

The parish of RICHELIEU was St. VINCENT OF PAUL'S first mission. He is alluded to, in contemporary literature, as "Monsieur VINCENT."

Our hotel was the Faisan, in a corner of the Grand' Place, close to the Post Office and diagonally opposite the church. The internal arrangements of the hotel are old-fashioned, the staircase to our room being steep, dark and narrow, and the doorways low. The ceiling is beamed and none too high, while the floor is tiled and undulating. For all that, the hospitality of the hotel proprietor was most cordial, and the creature comforts exceptionally good. The Place formerly had trees planted on it, adding greatly to its picturesqueness. These had disappeared when we were there.

The town also boasts of a band—a military one—which we had the unexpected pleasure of hearing, and which was not only excellent, both in execution and *répertoire*, but deservedly popular.

Our only regret was that the time at our disposal was short, as we had to visit Luçon before returning to London; but we are not without the hope of renewing our acquaintance with the delightful *monument historique* before the end of the century.

PETERBOROUGH CATHEDRAL: WEST FRONT.

By the REV. T. GARBETT.

THERE was, perhaps, little or no interval between the completion of the nave in the circular style of architecture and the erection of the north-west tower in the lancet or first style of the pointed. The original plan of the front, like that of Lincoln, comprised, no doubt, two towers rising at the western extremity of the side aisles of the nave, having a Norman base with circular lights, and an additional transept projecting north and south beyond the line of the side aisles. But before this design could be carried into execution architecture itself had undergone a change; pointed arches were substituted for circular ones, and slender isolated columns for the clustered shaft or solid cylinder. Hence the difference in style of the tower just referred to, the string-moulding at the base of it, together with the superstructure and the pinnacles and pediment which surmount the adjacent transept, being all of a later order than the work of the nave, and hence also the union of both styles in the transept itself, its lofty arches parallel to the side walls being highly pointed, but with the zigzag ornament, and resting on Norman shafts, and the doorways of the front having circular heads, in accommodation to the arches of the nave, but with pointed mouldings and pillars.

The tower, towards the south, appears never to have been finished, although unquestionably included in the architect's design. The present base above the transept is of comparatively modern date, and altogether inferior to the work of the north-west tower. In the progress of great undertakings it not unfrequently happens that fresh objects present themselves to the mind, which at first were not thought of. Such appears to have been the case in respect to this cathedral, the architect of which, while completing the front, seems to have caught a new idea—that of erecting two lofty turrets beyond the outer angles of the transept, towards the west, and of converting the intermediate space into a sort of piazza, by arches constructed in front of the nave and closed in above by a vaulted roof. This idea, so unique and at the same time so splendid, he was enabled to realise; and posterity, at the distance of six centuries, beholds with ineffable delight and admiration a composition, the outlines and details of which, for their beauty and variety, render it one of the noblest façades in existence. Towards the north and south are two lofty turrets, flanked at the angles by clustered shafts, rising from a projecting base and crowned with spires, the height of which from the ground makes a square with the breadth of the front. The space between these turrets is occupied by three pointed arches, reaching the whole height of the upper walls of the nave and resting on triangular piers, which are faced with clustered shafts like those of the turrets, and terminate in octangular pinnacles, resting each upon a square basement, and divided by a moulding into two stages, the upper one of which is perforated with narrow lights, edged with the dog-toothed quatrefoil. The sides of the piers are lined with isolated columns in channelled recesses, each column sustaining a ribbed moulding of the arch above, and the whole series being finished with interlaced and foliated capitals.

The centre arch is narrower than the outer ones, the reason of which will appear when we look at the situation of the doorways opening into the side aisles of the nave. Had the architect designed the three arches of equal breadth the piers which sustain the centre arch must have stood immediately in front of these doorways, or the outer arches must have been so contracted as to bring the turrets within the line of the transept, and thereby conceal, in part at least, the towers behind.

This circumstance of itself shows that the turrets, piers and arches, as they now exist, formed no part of the original plan. The interstices between the pillars which sustain the centre arch differ from those of the outer arches, in that they are chequered at regular distances with clumps of foliage, as if exuberance of ornament were designed to compensate for inequality in other respects. This inequality has been since still further obviated by the erection of a porch, which, after a minute inspection, appears to have been inserted by way of support to the central piers, both of which had previously swerved from the perpendicular, as may still be seen. Over each arch rises a lofty pediment, bounded by the wave and billet ornaments, and surmounted by a perforated cross. The spandrels formed by the base of the pediments and the arches beneath severally contain, first, a deeply-recessed quatrefoil, above this two trefoil arches, and still higher two pointed arches resting on slender pillars and filled with statues, and also a hexagon, the featherings of which clasp a human head.

The pediments contain each a large circular light, with other apertures and niches. The circle of the central pediment is divided by mullions into eight lights, under trefoil arches radiating from an orb. Those on the sides are divided into six lights, the featherings of which are very beautiful. The mullions, or radii, are all faced with small pillars and capitals, and lined with the dog-toothed quatrefoil. The outer moulding of the central circle is composed of closely compacted trefoils, that of the others has the wave ornament. At the base of each circle is a series of trefoil arches, resting on isolated columns, four of which admit light into an apartment above the vaulting, and three contain statues. The intermediate spaces, formed by the circle and the pediment, contain two niches, one on each side and another above, all filled with statues. The niche in the apex of the central pediment contains a statue, apparently of St. Peter, to whom the church is dedicated, representing the apostle with the mitre, pall, keys and other insignia of the Bishop of Rome.

The turrets, before mentioned, are divided by the round moulding and string-courses into six stages, which are empanelled in front with arches of different forms and dimensions. In the first stage from the ground and rising from a channelled base, are two lofty pointed arches resting on slender pillars. In the second stage are four trefoil arches similarly supported; this range is continued round the facings of the inner wall immediately over the doorways and forms the base of the windows. The third stage contains one pointed arch, intersected by a pillar in the centre, with curved mouldings, forming two lesser arches; which last are again subdivided by pillars, sustaining one circular arch in the centre and segments of arches on the sides.

The interstices above contain two trefoil arches, with brackets at the base for figures. The mouldings of the outer arch, with the sides of the pillars and all the subdivisions, are studded with the dog-toothed quatrefoil. In the fourth stage are two deeply recessed pointed arches, resting on clustered pillars; immediately over these is a string-course of stemmated trefoils, which is continued round the front, the transepts and the base of the north-west tower, together with the more modern base towards the south. In the fifth stage are four trefoil arches, like those of the second stage: these lie parallel with those at the base of the pediments already described, and with those also of the side transepts. The sixth stage contains four long and narrow pointed arches, having corbels in the space above, and resting, like the whole series of arches below, on slender isolated columns with prominent foliated capitals; above these is a string-course of rosettes, forming the base of the parapet. Thus far the two turrets are strictly uniform, but in the parapets by which they are surmounted, and in the pinnacles which terminate the clustered shafts, there is a marked difference.

The parapet of the north turret consists of the wave ornament, with double featherings and intersections; the pinnacles at the angles are hexagonal, corbelled at the base of the pyramid with human heads, and finished above with crockets and finials.

The parapet of the south turret contains a series of quatrefoils, while the pinnacles at the angles are beautifully blended

with the clustered shafts so as to form a regular and continuous course and termination; the mouldings are carried up in high pointed pediments, and from these a cinquefoil arch at each angle, surmounted also by a pediment with a quatrefoil in the spandrel, connects them with the spire in the centre, and sustains a lofty triangular pinnacle, which, like the pediments below, is decorated with crockets and a finial. In this respect the south spire differs from the other, which has no connection with the side pinnacles. Both are pierced with pointed windows in two ranges, four in each range, divided by mullions, and crowned with crocketted pediments, and the apex of each is terminated by a finial and cross, included in the extensive repairs carried on by the present Dean and Chapter.

The style of these spires, with the parapets and pinnacles, marks them out as a later work than the turrets beneath, and we may infer from the similarity of their details to those of the porch that they formed a part of the repairs and alterations which the whole front appears to have undergone when that appendage was inserted, and when the central window of the nave was enlarged, and that and the others which now enliven the inner wall were filled with Perpendicular tracery. The porch is vaulted with stone, and is entered by an obtuse arch, over which is an elliptical window, divided by mullions into six lights under cinquefoil arches, which are again subdivided in the head into lesser arches.

The spandrels formed by the curve of the arch and the base of the window are enriched with circles, clasping shields of arms, and rosettes with other devices. The arch and window are bounded by buttresses, which are broken by offsets and empanelled with niches. Besides these the porch is flanked with staircases, one on each side, forming three parts of an octagon, and leading to an apartment now used as a library. The summit is closed in with an embattled parapet, having a pediment at each end and one in the centre. The surface of the walls is enriched with canopied niches, pilasters, brackets, panel-work and string-courses in all the wildness and profusion which distinguish the last stage of Gothic architecture.

Besides the arch before mentioned, the porch has two smaller arches, north and south, parallel with the piazza formed by the great arches and piers of the front, and keeping up the communication with its opposite extremities. Over these also are mullioned windows, with blank interstices.

The great window of the nave, the outer arch of which is obviously an alteration from the original design, is divided by mullions into five lights—those of the side aisles into three lights, both under cinquefoil arches—and the lancet window of the transept into two lights under trefoil arches: these windows are parted, each by an embattled transom into an upper and lower range of lights, and the heads filled with subordinate tracery.

The doorways beneath are exceedingly rich, and in point of execution and delicacy of detail, perhaps the finest portions of the front. The central doorway is divided by a pillar, rising from a carved cylindrical base into two smaller arches; but the whole design and finish cannot be made out in consequence of the introduction of the porch, the foundations and butments of which are built against it.

The arches of the side doorways are lined with isolated columns, receding in the manner of perspective; the ribbed mouldings between these columns, the interlaced and pendent foliage of the capitals and the multiplied mouldings of which the arches above are composed cannot be too closely examined or too much admired. This is that peculiar style of Gothic architecture in which the beauty of the pointed arch, with its accompaniments, is best discerned, and therefore it is that judges are wont to give it the preference over all subsequent alterations and refinements. The spaces between these doorways, like those of the windows over them, are empanelled with pointed arches, subdivided by smaller arches and resting on slender pillars.

From the brief description thus given of this stately front, the reader will perceive that it was begun in one age and finished, as we now behold it, in another. Some discrepancies of style may therefore be expected to present themselves, but these are so eclipsed by the grandeur of its leading features that the eye takes in the whole as a single conception, and overlooks, in its contemplation of such a magnificent association of objects, the marks of difference that exist between the efforts of earlier and later genius.

The School of Art Wood-Carving has been removed to the Imperial Institute. It will be reopened after the usual summer vacation on Monday, September 5. Free studentships are maintained by means of funds supplied by the City and Guilds Institute for the advancement of technical education, and by the Drapers' Company. Some of these studentships are at present vacant, and forms of application for them may be obtained by letter addressed to the manager.

COWDRAY HOUSE AND ITS OWNERS.*

PROBABLY in the south of England no remains possess greater interest than the stately ruins of Cowdray House, and in three respects these crumbling walls are especially attractive—first, as regards the beauty of the site occupied by them, and of the charming country adjacent; secondly, the magnificence still prominent in the mansion itself; and thirdly and lastly, the interest attaching to the history of the family who built and who owned Cowdray for so many generations.

The plan of the mansion was a quadrangle, the form which our ancestors delighted to use down to the times of the Tudors, and one they inherited from the Romans. By this four-sided arrangement the various parts of a house are most readily connected with one another, but in modern times it has been but little used, as other plans are more accessible to air and light. The area was 122 feet by 110 feet; the chief front faced the west, and the loftiness of the building was remarkable.

The entrance gateway displays a large panel bearing the arms of the Montagues with the sixteen quarterings required by heraldry to make a family truly noble. Two wolves form the supports, and under the shield is the motto "Suivez Raison," or "Follow the Right." The groining of the lower storey is a curious mixture of styles, and on it will be seen the badges of a trefoil and of an anchor, the latter device probably used as an allusion to the fact that the first who erected Cowdray, Sir William Fitzwilliam, was an admiral, and commanded the fleet which escorted Henry VIII. across the Channel in 1520, when that monarch attended the meeting known as that of the Cloth of Gold.

In the outer courtyard there was a fountain, which, at the destruction of the house by fire, was removed to Woolbeding.

Conspicuous in the inner court are the three windows and great bay window of the great hall, and the latter is in all probability the grandest and noblest example of a bay window now existing, with its six lights crossed by no less than five transoms. Formerly the roof of this fine hall had a lofty louvre or spiral of three stages surrounded by a multitude of pinnacles with gilded vanes, whilst an elaborate ridge crest of lead-work ran from end to end of the roof, the end gables of which were also pinnacled.

The inside dimensions of the great hall were 60 feet in length by 28 feet in breadth, and the roof was an oaken one said to have been removed from Battle Abbey refectory, which, however, was 36 feet wide, so that it must have been much cut down from its original dimensions.

The fondness of our ancestors for the chase is shown by the fact that this room was called the Buck Hall, and that round the walls were placed life-sized figures of bucks either in repose or standing. The walls beneath the windows were panelled, and had in the upper part full length pictures of the twelve apostles. There were also paintings of Actæon and of Diana with her nymphs. I would here observe that the planning and arrangement of a Tudor dining-hall were perfect—the windows, set high up, did not dazzle the eyes of the guests seated at table by cross lights or the rays of the setting sun, and at the end of the room was a bay window from which to look out, and the recess itself served for a place to retire for private conversation. Cavendish in his life of Wolsey often mentions this use of the bay window at the Cardinal's palace at Hampton Court.

In early times the hall was used as the dining-room of the greater part of the household, but later on the owner of the mansion and his family dined apart from his retinue in a room adjacent to the great hall, as was the case here, and this room was embellished with wall-paintings of the military exploits of the first Sir Anthony Browne. These perished in the lamentable fire, but the Society of Antiquaries fortunately possesses copies of them. Traditionally these pictures were by Holbein, but with greater probability were the work of Bernardi, the artist who did so much work at Chichester Cathedral.

Behind the hall was the grand staircase. It was a wooden one, the ascent being by remarkably easy steps. Traces of the plugs to which the side wainscotting was fixed still remain. The walls above were painted by Pellegrini.

Till quite recently the chapel for domestic worship formed an essential adjunct to every house of any importance. In the Middle Ages it was a separate and conspicuous addition, but in the latter half of the fifteenth century it began to be merged into the general design, as was the case at Hurstmonceaux Castle and here. In both cases the chapels end in three-sided apses; here the walls were much older that the decorations on them, and, as at Hurstmonceaux, there was a western gallery communicating with the chamber floor, so that the members of the family could attend service without mingling with their domestics in the body of the chapel. The walls were wainscotted with mahogany to the height of 8 or 10 feet, a most costly embellishment, as the wood was then a most expensive one. The altar was covered by a baldachin or open canopy

* A paper read by Mr. J. L. André at the annual excursion of the Horsham Museum Society to Midhurst.

reaching to the roof, and the altar-piece was a painting by Annigoni of the Resurrection. This was fortunately rescued from the flames. Life-sized figures in plaster, probably of Saints Peter and Paul, were on either side of the sanctuary, of which fragments still survive, whilst elegant arabesque panel-work ornamented the walls and the sides of the windows.

The kitchen was formerly open to the roof, as in many old mansions and monasteries. The present dividing floor is of modern date. Scattered over the house, beside the numerous pictures already mentioned, were others brought from the dissolved abbey of Battle and many family portraits, some being by Holbein.

In the Middle Ages most first-class buildings were covered with lead, which was laid on at about 10 lbs. to the foot, a thickness not dreamed of now. Here the roofs were heeled with this costly material, which was also the case at Hurst-monceaux, where it occasioned the ruin of that fine building, as a former owner, a certain Lord Dacre, stripped off the lead to pay a gaming debt.

Besides the costly decorations described, the walls were in some parts covered with ornamental tiles in various colours, and where only plastered the plaster was of the best kind, only a quarter of an inch thick, with plenty of hair in its composition, and very superior to the modern coarse mixture of lime and sand laid on an inch thick.

Having now described this beautiful and once elegantly decorated house, a few words may be devoted to the builders and former owners of it.

Once upon a time, that is to say in the days of Henry VIII., there lived a courtier of that king named Anthony Browne. He appears to have been a man of considerable abilities, and employed them with so much tact that he became one of the most intimate favourites of the monarch, and accompanied him in many of his warlike expeditions, was made the royal standard bearer, and as his epitaph says "Master of the Kyng's Majesties horcys." Moreover, at the dissolution of the monasteries Henry bestowed upon him the rich abbey of Battle with all its extensive possessions. Besides the ample fortune thus obtained, he in 1543 acquired the lands at Cowdray on which the house now stands, with the park adjacent. These domains fell to his lot by the decease of his maternal brother Sir William Fitzwilliam, Earl of Southampton. In 1548, to use one of old Anthony Wood's quaint expressions, "he surrendered up his last breathings," and was buried beneath a sumptuous monument, still to be seen in Battle Church. His family, it may be mentioned, also owned Betchworth Castle in Surrey, the ruins of which we inspected in one of our excursions.

Before the acquisition of the Midhurst property by the Brownes, the former possessor, the Earl of Southampton, had begun the erection of a magnificent building, part of which is incorporated in the present mansion, but it was left to the son and successor of Sir Anthony Browne to complete it. Like his father, he was named Anthony, and in 1554 he was created Viscount Montague. From him proceeded seven viscounts in unbroken succession, the last of these being drowned in 1793, and leaving no issue, the Cowdray estates passed to the Poyntz family, and in 1843 into the hands of the Earls of Egmont. Two royal visits were made to the newly-erected house of the Montagues. The first of these was that of Edward VI. in 1547, and a letter of the youthful king says that here he was "marvellously, yea rather excessively banketted." In 1591 occurred the second visit of royalty, when Queen Elizabeth spent several days here, and was most sumptuously entertained by the first viscount. In accordance with the customs of the age, pageants of wonderful elaborateness were exhibited for her amusement. At her arrival, for instance, she was confronted by a man in armour, who told her there was a prophecy that the walls of Cowdray House would shake and the roof totter until "the wisest, fairest and the most fortunate of all creatures should arrive." The queen, of course, was this happy and unique being, and henceforth the house would be immovable and sound. At another time sixteen bucks were slaughtered before the queen, who viewed the butchery from a turret of the house, and at the last evening of her visit there was a grand "daunce," as our ancestors termed it, and at which, to their great delight, the neighbouring peasantry were invited to behold. The splendid reception given to Elizabeth was not the first occasion on which the first Viscount Montague had shown his loyalty to the throne, for in 1588 at the time of the Spanish Armada he was one of the most zealous defenders of his country, and came in person before the queen with a band of horsemen, nearly 200 in number, and which he placed at her disposal. In the same year as the royal visit this venerable man passed to his rest, and Baker in his "Chronicles' says that Queen Elizabeth always loved him, and in his sickness went to visit him. A splendid monument was erected to his memory in Midhurst Church, but which was afterwards removed to Easebourne.

Almost regal state was kept by the Viscounts Montague at Cowdray, and in 1595 the second viscount drew up an elaborate code for the regulation of his extensive household, the officers and chief male servants, thirty-seven in number, having each his allotted duties minutely described, and the record furnishes an excellent example of the elaborate etiquette of an Elizabethan noble's retinue. To the second viscount the people of Battle are indebted for the change of their weekly market from Sunday to Thursday. He died in 1629, and was succeeded by Francis, the third viscount, who suffered much as a royalist in the time of Charles I., his goods being confiscated in 1644 by order of the Commons. During the lifetime of the fourth lord in 1703 the great storm of that year blew down several chimneys at Cowdray, and which, falling on the roof, did great damage. Finally, the last viscount, George Samuel Browne, met his death by drowning at the Schaffhausen falls on the Rhine in 1793 whilst trying to shoot the rapids, a foolhardy attempt which also cost the life of his companion, Charles Sedley Burdett. This sad event happened in September, and in October of the same year a conflagration took place at Cowdray entirely consuming this noble house.

Claims to the title of Viscount Montague have since the last lord's death been made by various persons, and in the Reliquary for 1888 it is said that "it is by no means impossible that the true claimant to this title is still living in very humble circumstances in Derbyshire." What grounds there may be for this assertion I know not.

ANCIENT BOOKBINDING.*

THE covers, boxes or bindings in which manuscripts or printed books have been preserved have, as a general rule, had some analogy in outward form to the inner shapes of the written or printed pages they cover.

After the rock inscriptions, which from their nature required no covering, probably came something resembling the impressed inscriptions in clay which still exist. The rock inscriptions were marked in outline on the stone by scribes or priests, and actually cut by workmen ignorant of the sense of the characters they were producing. In the case of the cuneiform inscriptions cut in stone, they were most likely written out by the wise men by means of short and long lines differently placed, the stonecutter producing the wedge-shaped form. In a country, however, where the use of sun-dried clay was well understood, it may easily be imagined that impressions made in soft clay were sometimes given to the stonecutters to copy from, and the transition from this auxiliary use to the actual preferential use of the baked tablet is easy. On the tablet of clay the "writing" has not undergone a second operation by another hand, but is impressed by the scribe himself.

A large collection of fragments of clay-bearing cuneiform inscriptions has been found by various explorers on the site of Nineveh, being the remains of the royal libraries of Sennacherib and Ashur-bani-Bal, the earliest being about the third century B.C. The majority of these "bricks" have no sort of covering, but among the later specimens are several which are enclosed in outer shells of the same clay. These curious instances of ancient "bindings" are usually impressed with a duplicate inscription, but sometimes this is shortened, so that it may indeed be considered a title of the work inside. This form of covering has not helped us in any way to our present form of book, but can only be considered as a curiosity of bygone times.

Another form that has been in use for a very long time and yet has equally not affected our present shape is that found to the present day in India, China and the East generally. It consists now as formerly in the shape of two long rectangular pieces of wood, ivory or metal, variously ornamented, enclosing separate leaves of the same shape in which the writing is done. These inner leaves are usually strips of palm-leaf, but they are variously found of gold, silver, ivory and lacquer, and are kept together by ornamental cords run right through, or metal pins. The outer pieces are ornamented in all kinds of ways; carvings, paintings, metals, *repoussé* and chased, and inlays in lacquer-work are often found, some specimens being of great beauty. In the case of sacred writings the upper cover is often found covered with small pieces of red pigment put on by worshippers, the earliest instances I think when bindings of books have come in for a share in religious ceremonies.

As well as these writings on palm-leaves, which are after all only of a limited range, manuscripts were made at a very early period on papyrus. This consists of the flattened-out fibres of a reed which grew plentifully in Egypt; the fibres were laid double, at right angles to each other, pressed, hammered and dried. The old manuscripts on papyrus are now very brittle, and often they have to be preserved between sheets of glass. The roll was the usual form for these writings, and from the Latin word *volvo*, "I roll," is derived our word for a book—"volume;" and although our books are not now rolled up,

* From the Cantor Lecture by Cyril Davenport, published in the *Journal of the Society of Arts*.

they are distinctly derived from the roll by a simple evolutionary process.

The fact that papyrus was not a very satisfactory material for writings was discovered as early as the second century, B.C., when for some reason Eumenes II., King of Pergamum, found considerable difficulty in obtaining enough of it, and he is said to have first used vellum for writing upon. Vellum is the skin of the calf or goat specially prepared with lime, and is the finest of all known materials for the reception of manuscript. It also was first used in the form of rolls. Paper was doubtless first made in China and other parts of the East, and does not appear to have been made in the Western countries until about the tenth century.

The forms in which the writings were made on these three materials are of three chief kinds, and from one of them comes our present shape of book. In the case of the prayers written upon the long strips of paper enclosed in the Buddhist "prayer-wheels," the writing is in very long lines written each of them the whole length of the roll. In the case of innumerable manuscripts on papyrus and vellum the writing is across the breadth of the roll continuously from beginning to end. In the case of later MSS. the writing is arranged in page-form, lengthwise as regards the roll, but only in short lines, and this form is the immediate ancestor of our modern page, and consequently the shape of its binding.

The rolls of papyrus were kept together by tapes wound round them, also of papyrus, and often sealed with mud seals. The rolls were sometimes kept in wooden cases in hollows cut for them, and sometimes in the bases of small statuettes of "Ptah-Socharis-Osiris;" but they do not seem to have had any special form of covering. The vellum rolls were kept in boxes, also cylindrical in shape, called "scrinia," and had frequently title-pieces attached to their ends; the wrappings used for the sacred manuscripts in the Jewish synagogues are often very rich and ornamental, as also are the ends of the rollers.

The page form of writing upon a roll was found to be the most convenient at a very early date by the Chinese, Japanese and Coreans; they also were the first to find out that if the rolls were simply folded backwards and forwards between the "pages" of writing or printing, the whole book became easier to read, and this form, known as "Orihon," is used in those countries to the present day. The leaves are apparently double and the outer edges, instead of being clean cut as with us, are only a fold, the inner sides of each double page being of course blank. The paper used in these books is usually very thin, so that no practical inconvenience is felt in reading them.

The same idea of folding the roll occurred also in the West, but was carried a step further, inasmuch as the outer fold was cut through, and so both sides of the material came into use. This of course necessitated some form of sewing or keeping together the inner folds, and the earliest form of this was equivalent to what we should now call "stabbing"—that is to say, two or more holes were pierced near the inner edge right through all the leaves, and through these holes were threaded cords of some kind, afterwards laced together in various ways. This stabbed work can be well seen on almost any modern Chinese book; the chief objections to it are that it absorbs an undue share of the inner edge and does not open very well, but for thin books not of much value it is very useful. Although this stabbed work was used for papyrus and paper, I have not found traces of it on vellum, but when the vellum rolls were cut up into leaves, as sometimes happened, and it was found necessary to fix their inner edges together, another method was adopted; this was also a very simple and obvious one, and better than the "stabbed" method, inasmuch as it took up none of the inner margin. A thread was passed through the inner fold—at first only one fold—and drawn round a strip of leather or vellum beyond: this process being repeated as often as necessary, produced at last a sewn book resembling in all material points one made at the present day. It was soon found that two or more of these doubled sheets of vellum would fit inside each other, and that one "sewing" would fix several of them, so "quiring" evolved itself.

The subsequent covering up of these exposed bands and threads at the back of the book, in order to protect them, laid the foundation of the large number of ornamental bindings which have been since produced.

It is curious that the earliest Latin manuscript existing is written upon neither of the materials hitherto mentioned, but is upon wax. In 1875 at Pompeii were discovered a collection of several small tablets of wood hollowed on one side and filled with a shallow layer of wax bearing inscriptions. One of these is the record of a payment to Umbricia Januaria, and is dated A.D. 55—the earliest Latin MS. existing. The "pugillaria" or "diptychs" usually consist of two leaves, but sometimes there are more, and in shape they are like our modern books; they are held together at the back by either leather thongs or rings, and many of them have small hollows for keeping the stilus in. These stiles were made of ivory, wood or bronze, and are generally pointed at one end and flat at the other for making erasures. Later on the diptychs became more ornamental and were made of richly-carved ivory; indeed from the third to the sixth centuries the Roman consular diptychs reached a very high degree of artistic beauty, and are especially interesting because they often have upon them portraits of the consuls who issued them, and are actually the first instances of decorative binding.

The most usual material for the bands and threads used in the sewing of books is, I think, hemp, or some vegetable fibre, but no doubt strips of vellum and leather were much used in early times; indeed, among the Hebrews the sacred writings were always sewn with some kind of animal tissue—sinew or gut. This was done in accordance with the Mosaical law as laid down in Leviticus and Deuteronomy, forbidding the use of "shaatnez," *i.e.* a material composed of woollen and linen threads mixed. So that for fear of infringing this law the animal tissues were used, and they are often so in other cases; our own Roger Payne unconsciously carrying out the tradition by always sewing his books with silk.

From the time when manuscripts on papyrus or vellum came to be cut into pages, somewhere about the fifth century A.D., the outer bindings have been used as obvious fields for the decorative artist, and some of the Byzantine and Mediæval work of this kind is almost fine enough to be considered among the finest existing specimens of this school of art. Although the so-called "Byzantine" art is not the finest school, in many ways it had immense influence, especially in the western direction, one development being especially interesting to us, namely, the beautiful Celtic work made under its inspiration.

The earliest decorative bookbinding existing, the manuscript for which is unfortunately gone, is probably a cover now kept in the cathedral at Milan. It consists of pieces of ivory carved with representations of Biblical scenes in low relief, and in the centre is a lamb within a wreath; this lamb is *cloisonné*, that is to say, a piece of metal in which flat wire is soldered edgewise in patterns enclosing small spaces, and in these spaces it is said that vitreous enamels exist. I have seen this binding, but unfortunately some time ago, and took the statement as to the enamels without question; but since then I have found that so many of these early so-called enamels are in fact small inlays of coloured stones, that I cannot possibly say whether these are truly enamels or not.

The Byzantine workmen are credited with having kept the secrets of enamelling on metal until about the second half of the eleventh century, and until this time they are supposed to have retained the monopoly of the art, which, it found in foreign countries, is supposed to have been done by Byzantine workmen who had emigrated.

At Monza, a town near Milan, is preserved a still finer and more interesting binding. It still encloses the copy of the Gospels for which it was originally made, and was sent, bound, to Theodelenda, Queen of the Lombards, by Pope Gregory the Great, in the seventh century. The letter mentioning the gift calls it "lectionem S. evang. *theca persica inclusam.*" The binding is wood covered with plates of gold, the decoration being alike on both sides.

A large straight cross occupies the place of honour, extending to the edges, and in low relief, the cross is outlined with a line of small cloisons enclosing rectangular flat pieces of garnet, sapphire and emerald. The inner part of the cross is thickly set with jewels cut *en cabochon*, that is to say rounded, not having facets, and some pearls; and at the slightly expanded extremity of each arm is a remarkable oblong jewel of greenish colour, having in the centre a yellow disc on which is a small red flower. These are usually described as enamels, but I think they are not such, being, I believe, all cut from a thick glass rod made in the same manner as the *millefiori* glass of Murano. Although I do not think they are enamels, no doubt great skill in glassworking is shown in their production. The spaces between the arms of the cross are each ornamented with a Γ (Gamma) and a cameo, the Gammas and the outer border being beautifully ornamented with cut jewels, flat, enclosed within small gold cloisons. Across the sides are added bars of gold on which is an inscription, "De donis Dei offerit Theodelenda reg. gloriosissima sancto Joanni Baptiste in basilica quam ipsa fundavit in Modicia prope palatium suum."

A similar design, a cross by itself, is found on the earlier side of the binding of the Gospels which originally belonged to the abbey of the Noble Canonesses, founded A.D. 834 by the Emperor Lewis the Pious at Lindau, on the Lake of Constance. The cross here is not so simple, but is curved in outline, resembling an elongated Maltese cross. There is no doubt that here are genuine enamels of great interest and beauty, both champlevé and cloisonné, enclosing which are lines of cloisons set with small flat garnets. The work appears to be Celtic under Byzantine influence, the spaces between the arms of the cross being filled with chiselled work in bronze of interlacing lacertine forms of pure Celtic character.

The work has been much altered and added to at various times, but the alterations have been well done and are obvious. It is suggested that probably it was originally made by Irish monks in a South German monastery. It is certainly one of

the finest bindings in existence, and now belongs to the Earl of Ashburnham. It was exhibited at the Burlington Fine Arts Club Exhibition of Bookbindings in 1891. The other side of this remarkable book is somewhat later, very ornate, having a crucifixion in gold and all thickly encrusted with jewels.

Among carved ivories, in which numerous Mediæval books were bound, one which is now in the British Museum stands prominently forward both for the beauty of its design and the wonderful skill with which the carving is executed. It covers a psalter written and illuminated for Melissenda, daughter of Baldwin II., King of Jerusalem in the twelfth century, and wife of Fulk, King of Jerusalem after him. It is bound in wooden covers in which are fine Byzantine ivories, measuring 8 inches by 6, exquisitely carved with scenes from Bible history. There are fillets interlacing with six circles in each side, in each of which a separate incident is shown, the remaining spaces being filled with scrolls and conventional figures, birds and beasts, and enclosing the whole is a beautiful border of scroll and leaf design. At the top of the under side is the name "Herodius"—doubtless that of the carver—and points are marked all over with small gems, turquoises, emeralds and rubies, the eyes of the persons and animals being extremely minute, some of them not bigger than the eye of an ordinary needle, so that it is likely some of the jewels in this binding are the smallest existing cut gems.

On the upper side are six scenes from the life of David, and between them figures showing the triumph of virtues over vices, all of these having little labels with words engraved upon them run in with red pigment. On the other side the six circles contain scenes representing works of mercy, and between them figures of birds and beasts.

In the South Kensington Museum is a splendid specimen of a Mediæval Textus, a copy of the Gospels of the tenth century, bound in oak, covered with gold, enamels and gems. The binding in its present state is much restored, but parts are undoubtedly very old and of a Celtic character. It was used at the abbey church of St. Maurice d'Agaune, from which it was stolen in the fourteenth century. Then it was kept at Sion, in the Rhone valley, and was eventually purchased at the Spitzer sale for the South Kensington Museum. In the centre is a seated figure of our Lord in *repoussé* and chased gold, round this are two hexameter lines in *cloisonné* enamels of white and green, much restored :—

"MATHEVS ET MARCUS LVCAS SCSQ JOHANE
VOX HORV QVATVOR REBOAT TE XPE REDEMPTOR."

The outer border is very broad and is ornamented alternately with rectangular *cloisonné* enamels and gold plates, jewelled. Of these the four side enamels are original, and so are some of the gold plates, in which is curious superimposed work in gold of curves terminating in heads holding pearls in their mouths. I think probably these few gold plates with the work on them are the only pieces of the binding left which are contemporary with the manuscript ; but it is likely enough that the general original design has been to a great extent preserved.

The under side of this book is probably in its original state ; it is covered in strong, red leather, studded with nails in the shape of a cross. These books were used as altar books, one at each end, and the upper cover only was usually made very ornamental. They used to be carried round the churches to receive the kiss of peace—a function which, in the western church, was transferred to the "Pax" somewhere about the twelfth century ; but in the eastern church the ornamented Textus is still solemnly kissed on State occasions.

There are several beautiful examples of Mediæval bindings in the various church or cathedral treasuries on the Continent, and some few specimens are shown in our great libraries in England ; the majority, however, are not with the manuscript they originally covered. In Russia there are some few ancient and fine examples. One of these, at Moscow, has most interesting enamels of the tenth century ; in another, also at Moscow, a copy of the Gospels in Sclavonic is the earliest dated binding I have come across ; an inscription in Russian round the edge begins, being translated, with the words "In the month of March, 1392, this copy of the Gospels was published by the order of Theodore Andreevitch."

In the Royal Irish Academy at Dublin are several fine examples of cases or covers for books adorned with metal-work and gems in a similar way to actual binding, with charming Celtic designs in bronze and silver. In England there is an absence of any specimens of this kind of work ; if any existed, as it probably did, it was destroyed because of the intrinsic value of the materials used ; much of this destruction doubtless took place under the early Tudors. Such books as now remain of English work are always simply bound in leather. The best known examples of this early work are perhaps the Winchester Domesday Book of the twelfth century, goat-skin ornamented with small impressions in blind, now in the library of the Society of Antiquaries ; the Gospel of St. John, written probably in the seventh century, but bound possibly about the tenth century, in red leather repoussé and "chased" with a little colour, now at Stonyhurst College, and the Latin Psalter of the twelfth century on which our sovereigns, from Henry I. to Henry VII., appear to have taken the coronation oath. This curious book is bound in thick oaken boards covered probably with deer-skin, and in the lower cover is a brass figure of our Lord in the attitude of the crucifixion. It is now in the British Museum.

From the twelfth to the fifteenth century, roughly, many enamelled bindings were made at Limoges in France. They are generally of the kind known as champlevé, and the same designs are often used over and over again. The later enamelled bindings from Limoges mark the beginning of the end of this kind of decorative work on books, because in the fifteenth century came the introduction of printing into Europe, which very soon caused books to become much commoner, much smaller and, as a rule, bound in a far cheaper and simpler manner.

Mr. W. H. James Weale, until lately art librarian at the South Kensington Museum, has made extensive researches on the subject of blind-tooled binding in Europe from the twelfth century onwards, and he is of opinion that the English school is pre-eminent for its work in this manner. From London, Winchester and Durham we still possess fine specimens, the various arrangements of the small dies used being most interesting and curious. In most of the English bindings of this kind oval or drop-shaped dies are found ; these combine charmingly with circles and parts of circles, a fashion carried on by Thomas Berthelet and also at Little Gidding. In France the arrangement of the small dies was often in perpendicular lines, and the designs were frequently heraldic. The stamps used on German bindings were often used in combination with beautiful cut-work on calf, and when on pigskin were also frequently tinted with colour, as they are sometimes in the bindings of John Richenbach of Gyslingen, who signed and dated many of his bindings, one existing as early as 1467. Larger and more elaborate stamps were introduced by various German binders in the fifteenth century, particularly Johannes Fogel and Anthony Koburger.

The blind stamps on early Italian books are usually of an Oriental character, Arabic knots and "basket" work. In the Netherlands the large panel stamps seem to have been first used probably during the fourteenth century ; and in the succeeding century these large stamps are plentifully found on French and English bindings. Many of them are signed with the name of the binder, *e.g.* "Ob laudem Christi hunc librum recte ligavit Johannes Bollcaert." The subjects of the panels are nearly always Biblical. In English panel stamps heraldic ornamentation is often found as well, and rarely floral designs. Saints are commonly represented on stamps of later date—St. George, St. Barbara, St. Anthony and numerous others—and in German books Lucretia is a favourite personage, Justice and other virtues also finding a place.

So that with the use of leather for binding books new methods of decoration came in play ; the earliest leather bindings both in the East and in the West are simply ornamented with plain impressions from small metal stamps, as we have seen, but after a short time a metal leaf was used as well. The earliest example of this "gold tooling" which I have been able to find exists on a copy of a part of the "Canon of Avicenna," written in Arabic in the twelfth century and bound in brown calf. The decoration is a beautiful arabesque, part of which is darkened by heat, and the outlines are marked in gold. It is in a bad state and has been rebound. There are other Arabic bindings in goat or calf, ornamented with delicate designs in blind, supplemented with small gilded rings and points. These rings are afterwards found in Italian work of the fifteenth century, copied no doubt from the earlier Oriental work, and it is supposed that from this source the beautiful art of gold tooling on leather took its rise. The gold used both on the Oriental and Italian books up to the fifteenth century is much thicker than what we use now.

The gold tooling introduced into Italy from the East rapidly grew into favour in France and England, but in Germany it did not find so congenial ground. The German work of the fifteenth century is notable, however, for the skilful cut leather, usually calf, sometimes used alone, sometimes in combination with stamped work in blind, and sometimes with colour or stain. The use of pig-skin stamped curiously and delicately is also characteristic of German work ; a celebrated binder—Jean Richenbach—not only designed his bindings but also often dated them, adding, moreover, a little delicate colour here and there on his white pig-skin.

In Persia there was a considerable output of bindings very deeply impressed with large engraved stamps having arabesque patterns upon them. These bindings are usually of paper boards covered thinly with inferior leather, and are often stamped with coloured metal leaf on which is hand colouring in places. This fashion of large coloured stamp became a favourite in Egypt and in the East generally ; the centre ornament is always an elongated oval with more or less elaboration around it. Many fine Italian bindings of the fifteenth century are copied very exactly from these Persian originals.

NOTES AND COMMENTS.

IT is no longer considered that ugliness and orthodoxy must be inseparable in a Scottish church. Tron Church, Glasgow, where Dr. CHALMERS once ministered, now belongs to the Corporation, and from time to time suggestions arise about the advantage of utilising the site for a secular building. It was reopened on Sunday after undergoing a course of repairs. One of the clergymen who officiated was frank in condemning the building :—"I cannot say," he remarked, "that the reopening of the church here gives me unfeigned joy. I would rather it had been elsewhere. It has served its day. No patching or painting will ever make it a beautiful edifice or useful in the midst of railway stations and warehouses. The taking-down of the buildings in front has revealed its black and gloomy exterior, and the little pendicles built against it seem to mock the venerable walls. It is a thing of ugliness and an eyesore for ever. It is not creditable to our administrative capacity that a building like this should stand in the very forefront of our city." The church is not remarkable as a work of architecture, but it has some historic interest. On the site was the first of the Reformed churches erected in Glasgow, and it derived its name from the tron or weighing beam which stood in front. That building was destroyed by fire in 1792. The existing building dates from that time.

THE type alone would reveal that the book on "The Decoration of Houses," by EDITH WHARTON and OGDEN CODMAN, jun. (B. T. BATSFORD), comes from America. Printing and illustrating are creditable. But the American origin is further seen in the first paragraph, which says that in Paris "it is impossible to take even a short walk without finding inspiration in those admirable buildings, public and private, religious and secular, that bear the stamp of the most refined taste the world has known since the decline of the arts in Italy." The words are, we suppose, to be interpreted in the same way as the common statement about trees being visible from every street in London. Paris has quarters which are as dreary as Pimlico. We have no wish to be hypercritical; all we wish to suggest is that the sentence about Paris resembles much else in the volume. There is no restraint on the admiration of old European work. The author's theory is that such examples should not be slavishly imitated. The spirit which inspired the decorators and cabinet-makers is to be sought after, and if attained it is to be employed to produce work that will be adapted to modern American requirements. There is a risk, however, that the effect of the book will be to enhance the importance of what is found in the mansions of English and continental grandees, and to make slavish imitations of furniture the vogue.

As a referee on all questions connected with the employment of electric power, Dr. JOHN HOPKINSON occupied a position that was almost unique. His melancholy death in the Alps on Saturday is, therefore, a public loss. Three of his children were killed at the same time. For professional success it is now necessary to possess physical strength, and no one could blame Dr. JOHN HOPKINSON as an expert mountaineer for resolving to ascend the Dents de Viesivi without other guide than his experience. He was to have returned next day to his duties in London. Dr. HOPKINSON belonged to a well-known family in Manchester, and was born in 1849. His father was Mayor; his brother is Principal of Owens College. After studying in Owens College he went up to Cambridge, where he became Senior Wrangler and first Smith's prizeman. He first applied himself to the improvement of lighthouse machinery, and was engaged by a Birmingham firm as engineer. Then he took up electricity and became an exponent of its power. His skill in mechanics served him, and he was regarded by corporations, companies and fellow engineers as a sound adviser. Dr. HOPKINSON had arranged to start for America on September 28, as representative of a syndicate of English ironmasters and engineers, to report upon the latest developments of Mr. EDISON'S new scheme for revolutionising iron mining by introducing the use of the electro-magnet—a scheme for which the syndicate has secured the European patent rights.

DURING the past year New South Wales has expended a quarter of a million on public buildings. The largest amount, 13,985*l.*, was on a court-house at Parramatta. It is constructed of brick with stone dressings, with an elaborate and handsome stone portico. The court-house contains full accommodation for all the legal business likely to be transacted at Parramatta, and extensive ranges of police buildings are attached in the rear. These comprise general lock-up, inspector and sergeant's quarters, barracks for constables and a range of stabling for mounted troopers, the whole forming probably the most complete establishment of the kind in the colony. The design, both externally and internally, is based on less stereotyped lines than is usually the case. The additions to the Supreme Court in Sydney have cost 13,244*l.*, and a court-house at West Maitland 12,157*l.* It was necessary to construct a new roof at a cost of 1,277*l.* over the central building of the Museum in Sydney, owing to the ravages of white ants, which found their way from the streets up through the interstices of the stone wall to the roof and rendered it unsafe. The new roof is mostly in iron with copper covering, while every effort has been made to eradicate the expensive and dangerous pest. Money has to be doled out in the colony, and owing to the want of attention many buildings have fallen into a state of dilapidation. No sooner is a year's vote available than nearly the whole of it is at once appropriated for requisitions brought on from previous years. Mr. VERNON, the Government architect, considers that if 50,000*l.* were granted for four succeeding years, it would be possible to place every building in a fair state of repair, and to arrange future periodical works according to a table, giving attention by rotation to all the buildings. It was proposed to hold an exhibition in Sydney in 1899, and plans were prepared for buildings to cost 183,000*l.*, but the project has been "indefinitely postponed." A similar fate has pursued Mr. VERNON'S designs for a new Parliament House in Sydney, which was to cost 500,000*l.* In 1860 there was a competition for a like building which also was as fruitless. Part of the present buildings has been in use since 1829, and taken as a whole, the building is unsuitable for present requirements, is a constant source of heavy expense for repairs, and owing to the greater portion of it being constructed of wood, is subject every day to the imminent risk of destruction by fire. By an outlay of 15,000*l.* it is considered the Houses of Parliament will be rendered less dangerous, and apparently the colony is not rich enough to erect a substitute.

THE Panthéon of Paris at present exemplifies French skill in wall decoration. Reproductions of nearly all the works have appeared in this Journal, but the building is also to demonstrate the power of French sculptors. Against the four piers of the dome will be groups to typify Mediæval France, Renaissance France, France in the seventeenth century, France in the eighteenth century. Prominent in the nave will be a group representing the French Revolution. On the right of it will be a statue or group which will be a memorial of VOLTAIRE, and on the left one of ROUSSEAU. Nearer the cupola will be a group devoted to DESCARTES, the father of French philosophy. At the entrance to the transept on one side will be M. RODIN'S group of VICTOR HUGO, and on the opposite side the MIRABEAU of M. INJALBERT. A great many busts of French celebrities will also be introduced.

THE French painters are discontented with the proposed Palace of Art which is in course of erection in the Champs-Elysées. They find that the lines for hanging are about 1,000 metres less than was anticipated. It is also asserted that the majority of the salles will be too small and that some of them will be circular, a form that is not adapted for the exhibition of pictures. If any hospitality is shown to foreigners it is concluded that French artists must suffer. Although the rival societies have debated the subject no official remonstrance from them has been sent to the authorities of the exhibition.

ILLUSTRATIONS.

CATHEDRAL SERIES.—PETERBOROUGH: WEST FRONT.—WEST FRONT IN 1827.—WEST FRONT, PLAN AND SECTION.

FEW attempts at restoration have given rise to more controversy than that of the west front of Peterborough Cathedral. We have considered it would be interesting hereafter to have a record of the front as it appeared while Messrs. THOMPSON were at work, for the character of the scaffolding will indicate that no wholesale destruction of ancient work was undertaken. Whatever was done in the course of the restoration was dictated by necessity, and the front could not be made secure with a less amount of labour. The authorities of the cathedral as well as the architect could not be indifferent to so remarkable an example of Early English work, for every inch of the masonry was a relic that was worth preservation. In a way the west front was as daring an innovation as INIGO JONES's portico to Old St. Paul's. At the beginning of the thirteenth century it was, however, probably accepted as a development that was inevitable. But it is manifest that the designer gave more attention to the front as an independent composition than to its relation with the plan of the cathedral. There are, no doubt, three bays corresponding with the nave and aisles, but the centre line of either of the aisles, if produced, does not coincide with the axis of the lateral bays of the front, and there is of course a more marked difference in the positions of the side doors. The late Mr. F. A. PALEY was of opinion that "a singular geometrical law seems to have determined the apparently anomalous place of these doorways." He assumed the whole space within the portico to be 38½ yards, which was divided into seven equal parts of 5½ yards each. Two of these, he said, are occupied by the doorway and its wall-space beyond at each side, and the three intervening parts (containing 16½ yards) are again unequally subdivided into a central doorway 2 feet wider than the others, and wall-spaces (arcaded like those at the end, in compartments resembling blank doorways), each 1 foot narrower than the end wall spaces. Internally, the west wall is divided according to a different law. The spaces are made by the vaulting piers, viz. 4½ yards at each end of the transept, 8 yards under each of the towers and 16 yards the interval between, in the middle of which the great doorway stands.

THE GUARDIAN ANGELS' CHURCH, MILE END, E.

WE published a few weeks back a view of the interior of this church, showing the contemplated decoration and alteration. We now illustrate the principal front as altered according to Mr. EASTWOOD's design.

OFFICE, COLLEGE OF ARMS.

ARUNDEL CASTLE.

THE Society of Estate Clerks of Works having visited Arundel had the satisfaction of hearing from Mr. G. Heveningham, clerk of the works at the castle, an account of the recent alterations at the Duke of Norfolk's historic home, embodying for the first time in a complete form a description of the great extensions which have been going on at the castle for a number of years.

In his introductory remarks Mr. Heveningham observed that there was a general impression among those who knew nothing about it that the rooms at the castle were highly ornamented, but as a matter of fact simplicity was their great feature and their great charm.

After briefly sketching the ancient history of the castle Mr. Heveningham dealt with the modern improvements. As to the Norman gatehouse, built by Roger Montgomery, it is interesting (says the *West Sussex Gazette*) to note that the portcullis, which was on the outer side, is about to be renewed. The buildings forming the modern castle occupy three sides of an irregular square, with courtyard between. Close to the Norman gatehouse is the chapel, which consists of nave and chancel, with apsidal end, 77 feet by 18 feet, one aisle on the west side 58 feet by 6 feet, and a small chantry 22 feet by 10 feet, a tribune at the south end, and a sacristy at the rear of the chancel. The division of nave and aisle is formed by an arcade of equilateral richly moulded arches, resting upon circular columns of alternate Purbeck marble and Painswick stone. The roof is groined with moulded ribs, chale cells and stone bands. The nave is lighted by five lancet windows, which are to be filled in with stained-glass; the chancel is similarly lighted, and two eyelets on the west side lend additional light to the aisle. The external doorway is at the south-east corner under vaulting of tribune, and an internal door at the end of the aisle gives communication to the castle. Altogether the chapel is a beautiful specimen of the Early English style. The great circular tower forms a striking feature in the west elevation. This tower, which for boldness of conception, sturdiness of outline and massive construction has probably no rival in the country, rises to the height of 100 feet to the top of the parapet, which is embattled. By far the largest and finest room in the castle is the great hall, which in length measures 133 feet and in width 38 feet, its height to ridge of roof 57 feet. It has a massive oak hammer-beam roof open throughout, with which it is covered. Over the fine screen at the north end is the minstrel gallery; there is a smaller gallery at the opposite end. The fine two light windows and the great bay window with their Geometrical glazing and armorial bearings are most effective.

Leaving the hall the main gallery of the south front is entered. This gallery is in the centre of the block, and runs from east to west throughout its entire length. It is 197 feet long, 11 feet wide, and has an arched and groined ceiling. At the south-west angle is another fine tower. From the ground to top of parapet it measures 138 feet, and when finished, unlike its neighbour, it will have a bold machicolated overhanging embattled parapet. The first room of importance on the south side, traversing the gallery eastward, is the new dining-room, which, again, is unfinished; in length it is 60 feet, in width 23 feet, with a height of 34 feet to the highest point of the semi-octagonal ceiling. It is divided into seven bays, the ceiling being of panelled oak with moulded ribs. Underneath is a smoking-room, with lavatory adjoining, and above are bedrooms. Opposite the dining-room is the grand staircase, which occupies a space of about 24 feet square; the stairs are 6 feet in width, and run round three sides of the square, carrying a richly moulded marble handrail in newel posts, surmounted by shields and supporters. The roof is groined with moulded ribs and chalk. On the west side is a beautiful niche for a statue, and above, in the centre bay of groining, are life-size statues of St. Henry and St. Flora. The staircase is lighted by lancet windows; the height to springing of groin is 33 feet and 46½ feet to point of same, and the staircase is flanked externally on the two angles projecting into court by a turret with stairs from ground floor to roof. Next in order comes the large drawing-room, 54¾ feet by 24½ feet, and 19 feet 9 inches high. It is lighted from the south by three deeply recessed two-light cusped and transomed windows, in a wall 7 feet in thickness. The ceiling is flat and of panelled and carved oak, and the massive oak cornice is richly embellished with shields and armorial quarterings of the Duke of Norfolk and the Earldoms of Arundel and Surrey; the smaller drawing-room adjoining is similar to the room just described.

There is a marked difference internally as regards the style of architecture in the east wing of the castle. The ante-room of the library is 27 feet by 22 feet and 15 feet high, the ceiling being of plaster of the Tudor period. The library measures 117 feet in length and 21 feet wide; it has a gallery running all round, and contains perhaps one of the largest private collections in the country. The whole of the internal fittings are of mahogany, and mahogany columns divide it into bays, each bay having a three-light window above the gallery on both the east and west sides, with the addition on the latter of a fine oriel window the whole height of the room. Next to the library is the billiard-room, which is lighted by fine lancet windows, and the ceiling is of oak. The breakfast-room adjoining is finished in a style corresponding with that of the billiard-room. The north drawing-room is a fine room, 50 feet by 23 feet 3 inches, lighted on the east side by lancet windows and by a fine bay window at the north; the ceiling is of oak. At the north-east angle is a tower, 19 feet square and 66 feet high, dating probably back to the sixteenth century. At the opposite or north-west angle is an octagonal turret, with spiral staircase, giving access to a small terrace garden, from which a flight of stone steps leads to the flower garden, which was probably the old tilting-ground of the castle. The space is enclosed on three sides by a curtain wall with rampart wall, having embattled parapet and small towers on the south-west, and within a short distance of the keep stands "Bevis's Tower," which, together with the curtain wall, has been carefully restored.

The Fitzalan Chapel, founded by Richard Fitzalan, Earl of Arundel, about 1375, has lately been most carefully restored, and is full of interest, containing the tombs of many Earls of Arundel for the last five centuries. The chapel suffered much wanton destruction during the siege of Arundel by Waller's army in 1643. On the south side is a small mortuary chapel, scarcely yet complete, and erected by the present Duke in memory of his father, Henry Granville.

The Bishop of St. Asaph has resigned the office of vice-president of the Cambrian Archæological Association, and has also withdrawn his name as a member.

HAIGH HALL LIBRARY.

THE members of the Library Association were invited to Haigh Hall, Wigan, the Lancashire seat of their president, the Earl of Crawford. The magnificent library was examined with great interest. The chief features of the unique collection of which the Earl of Crawford is the possessor are the manuscripts, early printed books and examples of metal and ivory bindings. In view of the visit of the Association a special catalogue had been printed.

After the luncheon the Earl said it might be appropriate that he should give them a short summary of the history of the Haigh Library. Practically the library was commenced by Mr. John Lindsay, who was one of the Octavians of Scotland, about 1580. When he had retired from the active part of his life (he was, as one of the Octavians, one of the eight rulers of Scotland in the time of the minority of James the Sixth of Scotland and First of England) he went into the kingdom of Fife, and bought a small place near Cupar. Ever since that time everybody in Scotland had a small place near Cupar; the phrase across the border was well known. He had a certain number of books which he brought to the old place, and also a very large number of manuscripts of distinguished men of Europe with whom he had had to do in his official capacity. He was succeeded in due time by his eldest son, Sir David Lindsay, of Balcarres, who was greatly devoted to book collecting. He amassed a very large number of books, of which they had seen specimens in the billiard-room of the hall that day. He was practically the last book collector of the family. So the library went on, and in 1680, or thereabouts, it was considered one of the greatest libraries in that part of the country. Sibbald, in his "History of Fife," mentioned the Lindsay Library as the great "bibliotheca" in Scotland. Drummond, of Hawthornden, sent the first copy of his "Flowers of Zion" to Lord Balcarres, with the hope that "he would receive it and allow it to stand upon the shelves at Balcarres—no unworthy place—the place where he had been so well received, and where he had seen so many old books." Things went on and succeeding Earls of Balcarres were soldiers and spent the greater part of their time abroad. The Rebellion came and passed. The growth, again, of the Stewart feeling in Scotland arose and culminated about 1715. It found his ancestors arrayed on the side of the Stewarts. Casting about as to what would be the best thing to do in order to save somewhat in case there was a wreck of his political prospects, the then head of the house gathered his most valuable papers and letters, and, making a parcel of them, went with them in his arms to the Advocates' Library in Edinburgh. He made them over to that library, and as the Balcarres papers they might still be seen there. There was no doubt whatever that had they been in his own library they would have provided an unrivalled field for the autograph collector, for they included, for instance, sixty or seventy letters of Mary Queen of Scots, all addressed to members of the family. The period of 1715 was a bad time for Scottish nobles who kept with the rightful sovereign. Afterwards, what between fines, the breaking down of commerce of every description and the poorness of the country, everybody was very low, and, still worse, there was a new outbreak a few years later in 1745. It was a fortunate thing for the family that the representative at that time was a minor, and consequently they were able to tide over without further disaster. That earl was afterwards a soldier, and spent the greater part of his life in foreign service fighting against the Turks in the Austrian and Polish forces, and founding a career for himself as a general. Towards the end of the last century, or rather before that, James Earl of Balcarres married at a very late period of his life and had a large family. Amongst them was the Lady Ann Lindsay, who subsequently became Lady Ann Barnard, whose picture they had seen, but who had better claim for their recognition as the authoress of the ballad "Auld Robin Gray." Her elder brother, Earl Alexander, again a soldier, a leader in politics and a governor in foreign parts, passed most of his time abroad, and during the time he was away he regretted to say that his mother, the old Countess of Balcarres, practically allowed the whole of the great library at Balcarres to be dispersed, broken up and given to the buttermen, who used the books for packing, &c. The result, he believed, was that there were not more than sixty volumes of the old collection in existence. The books had the arms upon them, and those present could imagine that whenever any of them happened to come into the market he made a struggle to get them. His grandfather, Earl Alexander, when he came to Haigh, had about 3,000 books which came to him by his wife. They were brought there, and practically formed the nucleus of the collection which the members of the Association had been able to see that morning. His father commenced collecting books at an early age. He prepared lists of what was desirable to collect and organised arrangements all over the Continent whereby he was enabled to get the books he was looking for. The library, as they would have seen, had a little of everything in it. His father desired to lay the foundation of a library practically of universal knowledge, so that any person wishing to acquire any information upon any subject might be able to go to its shelves and find the foundation of that subject. In a great public library such as that in the British Museum, and in others worthy of the name, they not only obtained the foundation of a subject, but they could follow it through all its ramifications. He held that the beginning of a big private library should be of such a character that they could obtain guidance upon any subject, leaving it to the individual who came after to develop special points which he desired to make his own. Acting on that principle, his father spread his net very widely, and he acquired anything he could find as a foundation, leaving it to his successor to fill out and develop it on such especial lines as he desired. It was of course a great advantage to any library that there should be two possessors of it consecutively who took the same interest in it. He was proud to think that he had been allowed to follow in the steps of his father, and still more proud was he to think that his eldest son would follow in his steps. They would have seen a fine collection of Oriental manuscripts in one of the rooms. They were there for the reason that a knowledge of the literature and learning of the East could only be found in manuscript. At the time the books were collected, and indeed at the present time, they could number the Oriental presses on their fingers, and fifty years ago there were but two Oriental presses in the world. At that period even the books were prepared by a process of lithography. Since then there had been a great advance in the reprinting of Oriental works, brought about by the Asiatic Society of England and of other nations of Europe. Still, however, as he had said, the vast proportion of knowledge of the literature of the East could only be found in manuscript, and therefore they had done their best to keep up the literary side so far as Orientalism was concerned in its original form, in manuscript. Again, a great portion of the library was in far-off languages, such as Chinese and Japanese. He believed he was right in saying that, so far as private individuals were concerned, his Chinese library was the largest in existence. If they were to speak of it as a Chinaman would, they would be able to say it consisted of 120,000 volumes, but, according to our more modest western diction, he might tell them that it contained about 12,000 volumes. With regard to manuscripts, his father, in his collection of manuscripts, contented himself with very few; he did not desire to go in for many Occidental manuscripts. There was, he thought, no necessity to go to those manuscripts in order to find learning, because probably all of them, whether in the Latin, Greek or other civilised language, would be found somewhere in print. He (Lord Crawford) took a rather different view of the matter. He felt great interest in palæography—in the history of writing and illumination—and he looked out for good specimens of handwriting from the earliest times, in all languages and all characters. Another matter he was interested in was what he called broadsides—things that were printed to-day, stuck on the walls in the afternoon, and torn down the next day and lost. There was no doubt that there were more materials to be found for the history of a country in the small things printed—little pamphlets, broadsides, &c.—than in other directions. They first became an item of local news, then they got into papers and pamphlets, and then into the county history, but the county history did not give the authority. He had found the greatest pleasure in going into byways, small shops, paper factories and such places and finding these things. He had thus become possessed of a large collection of proclamations, including seven proclamations that were issued in connection with the Gunpowder Plot. There was also in the library a large collection of Papal Bulls, amongst them one by Pius IV., in 1580, excommunicating Queen Elizabeth. That Bull was absolutely denied by historians at the time. An idea got abroad in this country that Queen Elizabeth had been excommunicated when she came to the throne, but it was strenuously denied by Rome at the time because she did not feel powerful enough to issue it. However, there it was at the present time. He had also in his own way developed the history of the French Revolution, and he possessed thirty or forty proclamations relative to the wars of Napoleon, printed in the language of the particular country and in the language of France in parallel columns.

Mr. Alderman Rawson proposed the health of the Earl of Crawford. He said the present was a very remarkable year in the history of the Library Association. It was remarkable for three things. First, it completed its twenty-first year. Secondly, it had been able to secure a charter of incorporation; and thirdly, they had as their president the noble lord who had entertained them so munificently that day. They had to thank him for many kindnesses, intellectual and physical, and in their name he tendered to his lordship their warmest acknowledgments.

The Earl of Crawford replied, and the company adjourned to the grounds, where a photograph of the party was taken.

CUMBERLAND AND WESTMORLAND ARCHÆOLOGICAL SOCIETY.

ON Wednesday, August 24, the Cumberland and Westmorland Antiquarian and Archæological Society visited Warwick, Wetheral and Corby.

Warwick Church.

When the party had reached Warwick Church by the picturesque walk under the trees, says the *Carlisle Journal*, the Rev. W. Blake gave a short account of the edifice, after which Mr. C. J. Ferguson read the following paper :—

The interesting church of Warwick is remarkable in more characteristics than one. It is remarkable in England to find a church of so completely developed type of primitive plan finished with an apse or circular east end in the Italian manner. It is remarkable to find a church of its simple plan laid out on so large a scale. It is remarkable to find a country church with a western arch of Norman type of such great size on so large a scale and completely encased in stone. It is remarkable to find a country church with a battered or sloping plinth after the manner of a castle. As regards its plan. It is generally accepted that the plans of our churches came to us from two sources : from the early Celtic Church in Ireland, where they built in stone and wood, and naturally adopted rectangular forms, and from the influence of the great Roman civilisation where they built in concrete a monolithic form construction with roofs of like construction, which took the form of semicircular vaults, domes and semi-domes, so that in ancient Rome after the time of the Republic, whenever a place of honour was to be formed beyond the main lines of the building, it took the form of a semicircular projection roofed with a semi-dome or half-saucer of concrete. Many of the primitive buildings of the Celtic church still remain in Ireland and Scotland :—1st, a rectangular building of one chamber only ; 2, a similar chamber with the addition of a sanctuary to it ; 3, a similar chamber with the addition of an enclosed space between the nave and sanctuary for a choir. The Celtic manner of building eventually prevailed in England. After the close of the missionary period which followed the mission of St. Augustine no churches were built on the Italian plan, but the Italian influence still showed itself in the occasional use of the apse, the wider sanctuary, the wider arch. At the earlier churches of Reculver, St. Pancras, Canterbury, St. Martin's, Canterbury, the apses have no chancel between them and the nave, neither had the greater apses of the monastic church of Carlisle. As regards the great scale on which it is laid out and its magnificent western arch, I have here a couple of dozen plans of ancient churches of the diocese—small churches like Over Denton and Cliburn and Crosby, great churches like Brough in Westmorland, Hawkshead. Only one, the great church of Hawkshead, exceeds this church in the width of its nave. Warwick Church is 21 feet 6 inches wide ; the monastic church of Carlisle 22 feet 6 inches. Hawkshead is 23 feet ; whilst of the smaller ones Newton Arlosh is 12 feet wide, Wastdale is 13 feet 6 inches wide, Over Denton 15 feet wide. We all know the process of development, how first the chancel was lengthened, then a north, a south aisle, a clerestory, a lengthening of the nave, a western tower, and so forth, but none of these things happened to Warwick Church. It was laid out on what you may call the largest scale of the primitive churches of the district, but after the twelfth century it made no increase. I take it, therefore, that Warwick was an important place in the twelfth century and earlier, and was outrivalled later on. As regards the great western arch, if you look at the sizes of the chancel arches of the smaller churches of the diocese of the twelfth century, though sufficient for such churches, you find that they vary from about 4 feet 6 inches at Isell, Kirkbampton, and Gilcrux, which are respectively 7 feet, 5 feet and 4 feet 6 inches wide. We find at Warwick an arch of 9 feet in width and 4 feet thick. At the less important position at the west end its existence can, I think, only be accounted for on the supposition that it was intended to convert the church at Warwick into a great church, with a great west tower, and aisles and arcades along its sides—a project that was never accomplished, but that later on they found it necessary to curtail the scheme and to rebuild the nave with no further additions to it. Not only so, but they found it necessary to make those walls defensible with few and narrow windows, with a battered base and with parapets. The church is dedicated to St. Leonard, the patron saint of prisoners and slaves. The only other churches dedicated to this saint in the diocese are the churches of Cleator and Crosby Ravensworth, the latter being rather doubtful. The introduction of the cultus of this distinctly Gaulish saint must, in the opinion of the late Canon Venables, be ascribed to Norman influence. A point to be further noticed is that on the face of the buttress on the south side of the church is to be found the rebus of Will Thornton, some time prior of Wetheral, and afterwards, I think in 530, abbot of St. Mary's, York.

Wetheral Church.

The party drove by the Plains Road to Wetheral Church. Mr. C. J. Ferguson read the following paper :—

Wetheral Church is thoroughly English. In no other country than England, as far as I know, is a building like this to be found, not even in the sister kingdom of Scotland, for after the fourteenth century the practical side of the English character developed a method of building in stone peculiarly fitted for stone construction which, from the mechanical arrangement of its piers, has been called Perpendicular. In this no other nation followed us, and although I do not propose to claim for Wetheral that it is an example of that particular phase of Gothic, it goes a step further, and at a time when other nations had with the revival of learning adopted a Renaissance of Classical architecture, England still stood to its guns, and created that charmingly domestic style of building a further development of Gothic architecture which we call Tudor, the last phase of Gothic—the term that gave us Hampton Court, that gave us Tamworth Hall, that under the influence of Thomas, Lord Dacre, converted Naworth Castle from a fortress into a domestic hall. Here then we find it as a church, and although at first sight we might imagine that with the exception of certain modern additions to it Wetheral Church had been built anew under the influence of Abbot Thornton, this is not the case, for if we examine carefully its plan we find that its walls are of different thicknesses which imply a difference in date, and if we compare it with other plans of the ancient churches of the diocese, which I again exhibit here, we find that Wetheral had another English characteristic. It attained its present size and completeness by a process of growth and development. It began probably as a church of two chambers only, much like to Upper Denton Church, and the first addition to it would be the lengthening of the chancel, when it became like Kirkbampton church in plan ; it then had a north aisle added to it, when it became like the great church of Brough-under-Stainmore. It then had a south aisle added to it, when it became like Irthington in plan. I take it that then it had attained to very much of its present plan without the modern additions since made to it—that from its great width and the absence of a clerestory it was dark and gloomy, and much repaired and patched up, and that under the influence of Abbot Thornton, whose name we find writ in full on the south door of the chancel, the chancel was rebuilt, a clerestory was added, new windows were inserted in the aisle walls and the aisle walls were refaced. Later on a poor little tower was built at the west end, poorer than any of the towers of the ancient churches of which I have a record.

Canon Bower next gave a full description of the recumbent effigies of Sir Richard Salkeld and Dame Jane his wife, only child and heir of Roland Vaux, of Tryermain, about the year 1500, which are in the church.

St. Constantine's Cells.

After having thoroughly inspected the church and the Nollekens statue therein the party proceeded on foot to Wetheral Abbey and on through the woods to St. Constantine's Cells. When the party had reached the cells, Mr. Hesketh Hodgson contributed the following paper on the subject :—

Little is known of the construction or early history of these caves. They are not mentioned in the register of Wetheral, and it is hardly to be expected that they would be. They are, however, as you see, excavated by the hand of man, being hewn out of the rock, and are clearly not natural caves. A letter from Mr. Milbourne, of Armathwaite Castle, then Recorder of Carlisle, which is printed in "Archæologia," vol. i., and in Hutchinson's "Cumberland," vol. i. pp. 160-62, was read before the Society of Antiquaries in London on April 17, 1755, in which he says that "Mr. Camden says that 'here (*i.e.* near Wetheral) you see a sort of houses dug out of a rock, that seem to have been designed for an absconding place.'" To which his annotator and editor, Dr. Gibson, Bishop of London, adds, "If not for some hermit to lodge in, being near the monastery." It is clear, however, that Camden had not seen the cells, and was misinformed about them, as he writes of them as consisting of two rooms, one within the other, whereas there are, as you see, three rooms, each having an independent entrance from the gallery in front. Mr. Milbourne says that they were generally called St. Constantine's Cells (Wetheral Priory being, according to Denton, dedicated to St. Constantine), or, by the country people, Wetheral Safe-gaard, which he thinks confirmatory of Camden's opinion. Dr. Prescott in his edition of the Register of Wetheral also thinks that their position "points to their occupation as a place of concealment and safety." When Milbourne wrote they were, as he says, "difficult of access, the only way to come at them being by a steep descent of several yards along a narrow and difficult path." They are approached by a gallery formed by a wall which is built before the cells, which Mr. St. John Hope, the assistant secretary to the Society of Antiquaries, considers to be probably of the fourteenth century. There were three windows and a chimney in it; probably the space between it

and the rock was covered by a roof, which would render the cells a tolerably comfortable dwelling. It is likely that these cells may be as old as the time of the Romans, who probably quarried the rock here, and that they have subsequently been improved by the monks. There are marks of bolts which show that the cells had doors. A little to the south of the caves, and about 12 feet above the river, there is a Latin inscription which Dr. Bruce read ("Lepidarium Septentrionale," p. 233, No. 468) as

MAXIMVS SCRI(P)SIT
and
LEG XX VVCODICIVS SIVS

which he interprets in part as Legio Vicesima Valens Victrix, but he gives the rest up. The Corpus Inscriptionum suggests CONDRAVSIVS. In Milbourne's time the inscription was followed by a rude figure of a buck or stag. He thought that the first line, MAXIMVS SCRI(P)SIT, was modern, and observes that "it is a yard distant from the rest of the inscription." In July, 1868, the *Carlisle Journal* published an interesting collection of the names and dates inscribed on the rock, which had been made by a gentleman (Mr. Wake of Cockermouth) then residing at Wetheral. They begin in 1573, and are continued by the collector to 1796. Among them occur many names which are still familiar to us; for instance, Salkeld, Skelton, Sibson, Brisco, Maxwell, Dixon, Railton, Dobinson and others still known in the neighbourhood.

Subsequently the members retraced their steps and crossed the river Eden to view the Dovecote at Corby Castle.

Excursion to Borcovicus.

The programme for the second day's proceedings had been arranged to include a visit to Borcovicus (Housesteads), on the invitation of the Society of Antiquaries of Newcastle, to meet the members of that Society and of the Durham and Northumberland Archæological Society, for the purpose of inspecting the excavations which have been made during the past two months under the superintendence of Mr. R. C. Bosanquet, of Rock, by the Society of Antiquaries of Newcastle. Borcovicus is in a better state of preservation than any of the other military stations that were built to defend the line of the great wall of Hadrian. It covers an area of about 5 acres, and has all its walls standing to a considerable height. The station is in the form of a parallelogram, with the corners rounded, and has a fortified entrance situated midway along each wall. There are numerous remains of foundations of buildings both inside the station and on the ground lying to the south, while chiselled stones and broken columns lie scattered about. Borcovicus was garrisoned by the First Cohort of the Tungrians. The modern name of the station is Housesteads, and it lies about 30 miles west of Newcastle-on-Tyne, near the main road to Carlisle.

The excavations were carefully inspected, and a visit was paid to the Roman wall itself, which at this place seems to be in a perfect state of preservation so far as the eye can see over the ridge. Subsequently the party met in the prætorium, where Dr. Hodgkin described the camp. He said that at one time there were a great many statues at that place, and the museums in Newcastle, and no doubt Carlisle as well, had been enriched by the things found lying ready to hand about 100 years ago. Unfortunately the excavators of that period did not go to work scientifically. They thought they had discovered the prætorium at this camp during the excavations of the past two months. The work had been superintended by Mr. Bosanquet, who had had much experience in the Greek island of Melos. It so happened, however, that the camp was the site of the richest pasture on the whole farm, and naturally the tenant did not want to see all the best pasture taken from him. Mr. Bosanquet had also had the assistance of Mr. Dickie, a Scotchman, who had done the excellent plans of the camp which they saw before them.

Mr. R. C. Bosanquet next described the excavations. He said there was a Roman well east of the camp, and with regard to the so-called amphitheatre to the north-east, they had run a trench through it which showed that originally it was a free-stone quarry. It had been used, however, as it contained a fair amount of Roman pottery. There was the usual mile-castle, a third of a mile to the west of the camp, and there was the old cave which was opened at the beginning of the century and robbed of its altars. They had now obtained a plan of it and had secured some antiquities which the original explorers missed, viz. three figures and two altars. They had also attempted to pump out the largest Roman well in the valley, and by cutting a trench had discovered parts of Roman oak piles and Roman oak floorings. In the camp itself most of the streets ran east and west. The prætorium corresponded closely with the forum at Chester. The official building, the headquarters—the orderly room, as they might call it—was always in the middle of these camps. They had found a sculptured door head with a design representing two birds and two snakes, which had not yet been properly interpreted. They had also come upon a granary, at one side of which an oven had apparently been constructed at some time or other. There also appeared to be another granary and a block of buildings composed of small rooms. In some other camps an underground strong room had been found, but at Borcovicus there had apparently been no attempt to construct one. The columns in the prætorium found here were unique on the Roman Wall. No two bases were exactly alike. Among the antiquities they had found in the prætorium were a silver brooch, a bracelet and some coins, which helped them to date parts of the building. In one corner of the building they had found the whole floor of the north-western room strewn with arrows. They had already counted over 1,100, and probably there would be about 1,200. Most of them had a small portion of wood adhering to them, and they were of various sizes. An astonishing quantity of nails were found with the arrows, and it seemed as if during some siege an arrow-smith had been engaged converting scrap iron into arrows. It was certain that after the chamber fell in it could never have been again regularly occupied. Two small inscriptions had been found, one having two names at right angles, while the other, a small altar not more than 8 inches high, had an inscription which had still to be deciphered.

After Mr. Bosanquet had described the excavations the antiquarians dispersed.

THE SANITARY WORK OF THE ROMANS IN LINCOLN.*

FROM the numerous Roman remains which have come under my observation during my residence in Lincoln, I have arrived at the conclusion that the old masters of the world had good and sound ideas on sanitary matters. I therefore venture to lay a few facts to show my reasons for this opinion before the learned members of the Royal Institute of Public Health. Although Julius Cæsar invaded Britain 55 B.C., the Romans had not penetrated into Lincolnshire until about the year 70 of this era, but no sooner had they settled down after subduing the country than, with their usual skill and energy, they began to build stations and houses, to till the soil, to raise sea-banks, to make roads and to cut dykes and canals. Many of the towns and villages built by the Romans in Lincolnshire remain to the present day, and several of their great works are used for the purposes for which they were made. The Roman dykes and drains, such as the Great Carr Dyke which ran from Lincoln to Peterborough, forty miles, parts of which are still in use, and the Foss Dyke that connects Lincoln with the river Trent, were not only works of the greatest utility, but were also land cuttings of vast sanitary importance, and must have immensely improved the health of the people through whose districts they were engineered, by drawing off stagnant and decomposing water. As makers of roads the Romans were hardly ever surpassed, and many of their old highways remain notable examples of their skill in the art. They generally laid the foundations with large stone slabs or concrete, which in a great measure prevent the road rutting deeply. Even in the construction of roads the Romans in their day rendered good services towards the advancement of the sanitation of the country. These old world highways are still the best we have, and are much used, especially by bicyclists.

Of the numerous towns built by the Romans Lindum Colonia was one of the most important. In these days Lincoln is divided into uphill and downhill, but in the time of the Roman occupation it was altogether uphill, and from its elevated position looked down southward on the valley below and the river Witham flowing tranquilly towards the sea. The form of Lindum Colonia was that of a parallelogram divided into four equal parts by two streets which crossed each other at right angles. At the extremity of each street there was a massive gate, one of which still remains at the north end of Bailgate. Bailgate is the northern of the four original streets, and is one of the oldest streets in England. It was the Sackville Street of Lindum Colonia, for in it were most of the principal buildings, the great basilica among the rest. The station was encompassed by an embattled wall, about 12 feet in thickness and from 20 to 25 feet in height. On three sides there was a deep ditch, but on the southern side the steepness of the hill rendered a fosse unnecessary. In the course of time the Romans advanced the southern wall as far as the present Stonebow. Roman Lindum possessed two of the ingredients necessary for perfect sanitation, namely, a good drainage and an abundant supply of fine water. The drainage, indeed, seems to have been perfect, if we may judge from the number of sewers that are found wherever deep diggings are made. The large sewers were constructed of bricks and cement, and the smaller drains of glazed earthenware pipes of about 2 feet in length, joined together by rings of cement placed outside. Standing, as Lindum did then, for the most part on the top of a hill, it was advantageously placed for the escape of sewerage into the river below, which probably was a tidal river at the

* A paper read at the Congress of the Royal Institute of Public Health by William O'Neill, M.D., of Lincoln.

time of the Roman occupation. Water was conveyed into Lindum by conduit pipes from springs on the high grounds in the neighbourhood. I had an opportunity, a few days ago, of examining some of these conduit pipes. They are made of dense well glazed red pottery of a superior kind. The pipes are about 4 feet in length, 8 inches in diameter, and are united by joints similar to those of a flute. Watercourses constructed of pipes like these could hardly, I think, be surpassed in a sanitary point of view. One of the springs which was utilised by the Romans is two and a half miles from the city. The water is splendid, and the engineering skill displayed to raise the precious fluid a sufficient height to force it through the pipes is most remarkable, and can even now be appreciated. Several large cisterns have been discovered for the storing of water, and I am inclined to think that water was even laid on in some of the principal houses.

Lindum Colonia had its vast granaries against the time of need, its hypocausts for heating and warming purposes, and its sudatories or Turkish baths. Two of these latter have been found, one of which had been a grand place. It had its stone pillars, its plastered walls painted red, blue and other colours, and its floorings decorated with white tesseræ worked into various patterns. The Roman youths of Lindum, and perhaps some of the British young men also, engaged a good deal in out-of-door healthful and invigorating exercises. They indulged in chariot-racing and foot-racing on the Carholme, where at the present time sportsmen hold the great horse races. The Roman youths were also given to the sport of hunting wild animals, and of coursing the hare. I have a vase of Roman ware, made at Upchurch, in our country, on which is represented in relief two greyhounds in pursuit of a hare. The Romans did all they could to preserve the health, as well as the olfactory nerves of the people who had to come in contact with the dead. It would appear, however, that there was some diversity of opinion as regards the merits and demerits of burying and burning. Cremation was practised by the Romans in Lincoln and so was burial, for stone coffins have frequently been dug up, and some of them have been lettered and dated in the Latin language, almost similar to the way tombstones are engraved at the present day. The Romans seem to have been firm believers in disinfectants, and especially in lime and charcoal, for they used them in great abundance in coffins and other places where disagreeable smells and decomposition were likely to take place. I have observed that several coffins discovered in Lincoln, although very massive, were generally too short for the bodies deposited in them, but to obviate the difficulties arising from this, the bodies were laid prone or sideways with the legs bent on the thighs.

In 1884 an interesting discovery of Roman remains was made about 100 yards north of the cathedral. Workmen, whilst clearing out the foundations of an old house for the purpose of rebuilding it, laid bare a crematory furnace, near the door of which lay a quantity of charcoal ready for use. The charcoal looked as fresh as if it had only been made the day before. About 8 feet distant from the furnace, but on a lower plane, the men next brought into view a small chamber or sarcophagus 6 feet long, 4 feet broad and 5 feet deep. It was built of stone, and had a heavy stone lid. When the lid was raised there were found underneath a layer of fine sand 14 inches thick, under this a layer of pulverised charcoal, and under the charcoal a layer of lime, embedded in which were ten one-handled vessels, in shape somewhat like a water-jug or coffee-pot. They were in an upright position excepting one, and all contained charred bones and ashes of the dead. The vessels were in various colours, but none of them in the slightest degree approached in form the conventional shaped cinerary urn. Eight or 10 feet north of the sarcophagus the workmen next laid bare an arched stone doorway 6 feet high and 2 feet wide that opened into a small room in which were found five or six very large handsomely shaped urns. They also contained charred bones and ashes, and were of a dark colour, and some of them had ornamental designs impressed on the pottery. The vessels were embedded in lime, and the contents were covered over with powdered charcoal firmly pressed down. On closely examining one of the urns I came to the conclusion that it had been twice fired. It was, therefore, probable that after the body had been cremated in the ordinary way, the remains were collected and placed in this large urn, and it, with its contents, again subjected to the fire of the furnace.

Of the sanitary arrangements of the private house of a country gentleman I am happy to be able to give a few particulars which I gathered from having inspected the remains of a fine villa that was discovered a few years ago in the Greetwell Fields, about a mile east of Lincoln. The villa was situated on a hill and looked southward, and the main body of the buildings formed a square, each side of which measured 40 yards. The remains were 2 or 3 feet below the surface of the ground, and consisted of little more than the floors of the basement apartments. The southern or front of the house was composed of four apartments of about 30 feet each in length. But the front was extended by a corridor (south corridor) 10 feet broad, which ran 40 yards eastward. In the back or north of the front rooms there were several others, all the floors of which were beautifully inlaid with white, red and blue tesseræ, in carpet-like patterns, no two being alike. There was one large square room, I should say a business room, that was floored with red tiles, 15 inches by 10½ inches. These tiles bore a checkered impressed pattern, and were similar to those mentioned by Pliny. It was difficult to ascertain the kind of material that formed some of the partition-walls of the inner rooms owing to decay, but I think that they were constructed of wood and plastered with cement. From one of the front apartments I have endeavoured to describe, three or four neat stone steps led down to a bath-room, a room which was considered of importance by the Romans, who frequently received visitors whilst in the bath. This room was the most advanced structure of the villa, and faced southward. From east to west the room measured 15 feet, and from north to south 10 feet. From the east end of the north wall the bath extended 7 feet southward along the east wall. The bath was 3 feet 6 inches in breadth, and its sides rose about 2 feet from the floor. The floor of this handsome little room was made of white china clay tesseræ of about 1½ inch square, and which were firmly set in concrete. Similar tesseræ were extended up the sides of the walls to form a dado, and tesseræ were also placed on the outside of the bath, but the surface of the inner side was quite smooth. Two or three feet north of the bath-room was a very deep well 7 feet in diameter; the water of this well no doubt was used in the bath-room, and from the bath-room a well-constructed drain pipe carried off the waste water. I have seen the same sanitary contrivance in the basement room of a Roman house that was laid bare in Exchequer Gate, Lincoln, near the west front of the cathedral. The walls of the bath-room in the Greetwell villa were painted a creamy white, and the decorations were executed in reds, yellows, blues, greens and black. Another bath and well were found on the premises, but these I did not see. The most peculiar features of this beautiful residence were the apartments designated by the late Precentor Venables "corridors." There were four corridors, which extended from the main buildings. One of them ran east and the others extended north for a distance of 50 or 60 yards. In breadth they averaged 10 feet, and their tesselated pavements were beautifully executed. The tesselated pavement of the east corridor showed high artistic skill, and was the finest piece of work of the kind I have ever seen. It is difficult to say for what purpose these corridors were built, but most probably they were intended for healthful exercise and recreation. Men and women coming from sunny Italy must have felt the variable climate of Britain most trying to their constitutions, but in corridors like these they could take their constitutionals in defiance of cold fogs and rain, without much risk of catching what is now called a "chill.' This villa must have been the house of a Roman gentleman of taste and opulence. He built it in a good situation on a bed of concrete, in some places 3 feet thick, roofed it with the finest tiles and made the drainage of the premises, as skilled workmen said, "perfect."

TERRA-COTTA IN ARCHITECTURE.*

IN speaking of the treatment of terra-cotta in architecture I would commence by using the remark of one who has said, "One of the most essential functions of architecture is expression, and all architecture should be, as far as possible, expressive of two things—its purpose and its construction. The question of purpose affects the general design of a building; the question of construction affects the special uses of the several materials composing it," and terra-cotta really demands a special treatment at the hands of architects in order to produce the most satisfactory results. The uses to which terra-cotta can, with more or less propriety, be applied are so many and so various that it is somewhat difficult to define where its application should commence and where it should cease. The plasticity of the material, whilst it gives great liberty and freedom to the designer and modeller, and as to artistic execution is capable of almost endless variety of treatment, yet from the nature of the manufacture it would, looking at it from the most successful and economical point of view, demand a limit as to the size of the individual blocks themselves. Terra-cotta should not be made in too large pieces, as the larger the piece the more difficult it is to handle in the manufacture and the greater the risk in the burning, and although I have seen some extraordinarily large columns and other work made by the North-Western Terra-Cotta Company and other companies, and which, as special pieces to suit a special purpose, were very good, they must have cost much

* From a paper read before the Cincinnati Chapter of Architects by Mr. J. Joiner.

labour and trouble and time in producing. I would not advocate pieces that would cube up more than 6 feet or 7 feet, unless it is absolutely imperative for the sake of construction, and as much under this as possible, and the more readily and more easily a terra-cotta block can be handled in the manufacture the better the result, and I think the architect would be much helped in making his design and application of terra-cotta work generally by paying an occasional visit to terra-cotta factories and becoming acquainted in some measure with the manufacture, if only on the score of the old adage that "Ignorance is expensive, but knowledge is power." The most pleasing effects from the use of terra-cotta will most surely come from those buildings that have been especially designed for terra-cotta, because much can be done by the architect in studying his design to counteract and allow for any little irregularity of shape and outline contiguous to the material, for whilst it would be very difficult to design anything in terra-cotta that could not be built in stone, yet a building could be designed for stone which could not be reproduced in terra-cotta in the same way, and right here is where the co-operation of the manufacturer would be of much assistance to the architect. The matter of design and the manner of treating terra-cotta are subjects for much thought, and require not only artistic ideas but the exercise of good judgment, for if terra-cotta is made to imitate stone it immediately becomes a counterfeit; it is a deception, hence it is an error, and one of the greatest pleasures which arise from the use of terra-cotta in architecture is the satisfaction engendered by the simple merit of the material.

Relation to Brick and Stone.

In speaking of terra-cotta in combination with brick and stone, or in comparison with either one or the other, I would say that terra-cotta has in itself more the nature of brick than stone. It can be used very successfully in combination with either one or the other or both, according to the scope of the design, but its effect is often marred by the attempt to make it an imitation. Mr. Wagner, of the North-Western Terra-Cotta Company, says:—"The great difference between terra-cotta and stone is that stone is ready for its designation after receiving the finishing touch by the carver or mason, whereas terra-cotta, when it leaves the hands of the modeller or presser, has yet to be dried and burnt, and this is a slow process, and one that is not always crowned with success, as a piece of terra-cotta will sometimes warp and twist and crack and be off colour. When stone is in the building it can be adjusted and worked up and the face wrought upon with a chisel, because the body of stone is homogeneous throughout, so that the same identical surface may be produced *ad libitum*, whereas terra-cotta has but one surface, which, once destroyed, can never be restored. Ends and unexposed parts may be trimmed like stone, but the face cannot be touched after burning." In the matter of smaller pieces, in comparison with stone, and the necessary frequency of joints in terra-cotta work, and which may be a point of objection with some architects, I would say this is remedied and overcome by making a lap or cover joint on all washes, and it must be conceded that the class of modelling and ornamentation that is now being produced in terra-cotta is far ahead of the general character of all stone carving, for terra-cotta modellers are not mere mechanics, but artists, and appreciate the value of beautiful figures and graceful lines. And as to the surface finish of terra-cotta, whilst terra-cotta should have its own particular finish, yet, if so desired, any kind of masonic finish can be placed upon the surface of it. Mr. Sullivan, of Chicago, the eminent architect, says, "The artistic possibilities of this fine material are limitless." There are several other important characteristics relating to terra-cotta, and which make it stand pre-eminently to the front as building material, viz. colour, strength, durability, fireproof quality, adaptability for steel and iron construction, and economy.

In speaking of colour there is always a peculiar brightness in the general appearance of all terra-cotta, which I think is due somewhat to the metallic condition of the ware after having been subjected to the high temperature of heat in burning, that lends a more cheerful aspect to buildings than any other building material known. Some twenty years ago two or three colours seemed to predominate, principally buff and red, but in the "eighties" an agitation of colours commenced, and demands for various colours were constantly being made, which demands were met as soon as they could be permanently and practically responded to by the manufacturers, until to-day enough colours can be produced to satisfy the most fastidious taste. I think a mistake is made where the terra-cotta is required exactly to match the stone or brick in colour. If the terra-cotta part of the design has a special "motif" or expression, which it should have, that part of the design should most certainly be expressed in a slightly different shade of colour to the brick or the stone, not too much to make it conspicuous, but enough to bring out the expression of the design readily, and here it would be well to add that architects must not expect perfection in the uniformity of colour in every block of terra-cotta, any more than the same expectation can be fully realised in the use of stone. Much has been said of late upon the subject of "white" or "cream" as a colour, and many buildings have been erected with terra-cotta of these shades of colour, but it has yet to be proved whether these very light colours are the most serviceable to adopt in the atmosphere of our large cities.

As to strength, whilst terra-cotta in itself has immense strength, both by way of support and resistance, yet it is never advocated that it should be placed into buildings in the same hollow condition that it comes from the factory, but, on the other hand, every block should be filled up solid with concrete or brickwork. The first crushing tests of terra-cotta, as far as I can gain any information, were made in the city of London by David Kirkaldy on June 17, 1868, at the instance of Charles Barry, the architect, who had been using 140,000 dols. worth of terra-cotta in one building, Dulwich College, and amongst the many tests that were made I would present this one to your notice:—A 6-inch cube of Bath stone crushed at 88 tons per square foot; a 6-inch cube of Portland stone crushed at 283 tons per square foot; a 6-inch cube of solid terra-cotta crushed at 442 tons per square foot. And which at once declared, at that time, the superiority of terra-cotta over stone in this respect. Mr. James Taylor, in an article in the *Clay-Worker*, reports some crushing tests made in May 1885 by the Boston Terra-Cotta Company, which were eminently satisfactory, and which, in fact, showed a better result than the tests on the English-made terra-cotta of previous years. Mr. Meyenberg, in the same paper, also bears testimony to the crushing strength of this material. Mr. Wagner, in the same paper, says:—"The tensile strength of terra-cotta is about 1,000 lbs. per square inch, compressive strength about 10,000, and if the voids and the solid portions of a hollow piece of terra-cotta were as one to one, it would compare favourably with good stone." Thus it will be seen that terra-cotta is fully competent to sustain its proper proportion of weight in a building. The weight of hollow terra-cotta with braces or reinforcements at intervals, made in the ordinary way, is about 70 lbs. to the cubic foot, but when filled in solid it would weigh about as much as brickwork.

The advantage that terra-cotta has in this respect needs no special proof in this paper, for they are all around us, and if we need a century proof in all ocular demonstration, we must surely wait a little longer. We know that timber will rot, stone will disintegrate, iron will oxidise, and other materials will more or less yield to the destroying influences of the elements, but hard-burned terra-cotta will stand in defiance of all weather.

Terra-cotta is claimed to be fireproof, and from what I understand of the results of our many recent fires terra-cotta did all that was claimed for it in this respect, and this is a very important matter, for in these days of tall buildings, under the present method of steel construction, it is very necessary that such materials be used, and in such a way as to render these "mammoth structures" or modern "beehives" as nearly as possible fireproof; hence the proper thing is to encase the iron-work of the front of the building with terra-cotta entirely, or brick and terra-cotta combined, for stone is not a good fire-resisting material, and encase the iron framing with what is called "fireproof terra-cotta," so as to prevent the heat arising from a fire affecting it, for we know that if iron is not properly protected it becomes the frailest possible material in the event of a fire, but if properly protected it becomes an important factor in all high buildings.

As to the cost of terra-cotta in comparison with stone, and which is the only building material that it legitimately comes in contact with in this respect (for galvanised iron, though much used, cannot be recognised in the category of constructional building materials), I would say that in perfectly plain work it is a sharp tussle between the terra-cotta and the stone, and if it is a work of no repetition stone is liable to be somewhat cheaper, for although the cost of terra-cotta, from increased experience and improved methods on the part of the manufacturers during the past few years, has been much reduced, the cost of stonework, from improved methods of cutting and planing, has been reduced also; but where there is much repetition of the same form, and where any amount of ornamentation is introduced in the mouldings, then the cost of terra-cotta is far below that of stone, and the effect of all such ornamentation is, from the plasticity of terra-cotta as a material in its clay state, far superior to anything that can be produced in stone.

In conclusion, I would like to say a word about setting terra cotta. Much terra-cotta is marred by imperfect setting down by common brickmasons, and it can be at once seen that a good stonemason is the best man to set terra-cotta. He can use a chisel, has been accustomed to set blocks of stone in alignment, and would be much more skilled in this connection with terra-cotta than any ordinary brickmason. Hence a better job could be expected from a workman of this character. Terra-cotta when it arrives at the building should be laid down on

some floor to ascertain the jointing that will be necessary to bring all the pieces together in good form, and thus the setter will become acquainted with each individual block and what it requires at his hands before he puts it into the wall. If a stonemason cannot be obtained, the next best man is one who has been accustomed to lay up best front brickwork. This is the final operation, and requires just as much care and attention as any part of the manufacture.

TESSERÆ.

Charles II. and the Arts.

THE restoration of royalty brought back the arts, not taste. Charles II. had a turn to mechanics, none to the politer sciences. He had learned to draw in his youth ; in the imperial library at Vienna is a view of the Isle of Jersey, designed by him, but he was too indolent even to amuse himself. He introduced the fashions of the court of France, without its elegance. He had seen Louis XIV. countenance Corneille, Molière, Boileau, Le Sueur, who forming themselves on the models of the ancients seemed by the purity of their writings to have studied only in Sparta. Charles found as much genius at home ; but how licentious, how indelicate was the style he permitted or demanded. Dryden's tragedies are a compound of bombast and heroic obscenity enclosed in the most beautiful numbers. If Wycherley had nature, it is nature stark naked. The painters of that time veiled it but little more ; Sir Peter Lely scarce saves appearances but by a bit of fringe or embroidery. His nymphs, generally reposed on the turf, are too wanton and too magnificent to be taken for anything but maids of honour. Yet fantastic as his compositions seem, they were pretty much in the dress of the times, as is evident by a Puritan tract published in 1678, and entitled, "Just and reasonable reprehensions of naked breasts and shoulders." The court had gone a good way beyond the fashion of the preceding reign, when the gallantry in vogue was to wear a lock of some favourite object ; and yet Prynne had thought that mode so damnable that he published an absurd piece against it, called "The Unloveliness of Lovelocks." The sectaries, in opposition to the king, had run into the extreme against politeness ; the new court, to indemnify themselves and mark aversion to their rigid adversaries, took the other extreme. Elegance and delicacy were the point from which both sides started different ways, and taste was as little sought by the men of wit as by those who called themselves the men of God. The latter thought that to demolish was to reform ; the others, that ridicule was the only rational corrective : and thus, while one party destroyed all order and the other gave a loose to disorder, no wonder the age produced scarce any work of art that was worthy of being preserved by posterity. Yet in a history of the arts, as in other histories, the times of confusion and barbarism must have their place, to preserve the connection and to ascertain the ebb and flow of genius. One likes to see through what clouds broke forth the age of Augustus.

General and Particular Ideas in Painting.

Nothing in the art of painting requires more attention and judgment, or more of that power of discrimination which may not improperly be called genius, than the steering between general ideas and individuality ; for though the body of the work must certainly be composed by the first, in order to communicate a character of grandeur to the whole, yet a dash of the latter is sometimes necessary to give an interest. An individual model, copied with scrupulous exactness, makes a mean style, like the Dutch ; and the neglect of an actual model, and the method of proceeding solely from idea, has a tendency to make the painter degenerate into a mannerist. In order to keep the mind in repair it is necessary to replace and refreshen those impressions of nature which are continually wearing away. A circumstance mentioned in the life of Guido is well worth the attention of artists. He was asked from whence he borrowed his idea of beauty, which is acknowledged superior to that of any other painter ; he said he would show all the models he used, and ordered a common porter to sit before him, from whom he drew a beautiful countenance. This was undoubtedly an exaggeration of his conduct, but his intention was to show that he thought it necessary for painters to have some model of nature before them, however they might deviate from it, and correct it from the idea of perfect beauty which they have formed in their minds. In painting it is far better to have a model, even to depart from, than to have nothing fixed and certain to determine the idea. When there is a model there is something to proceed on, something to be corrected ; so that even supposing no part is adopted, the model has still been not without use. Such habits of intercourse with nature will at least create that variety which will prevent any one from prognosticating, on being informed of the subject, what manner of work the painter is likely to produce, which is the most disagreeable character an artist can have.

Figure and Canopy Windows.

Whenever the figure and canopy window is adopted, the canopy, which is as much an integral part of the picture as the figure or group, ought to be represented, not as in old glass, as a mere flat panel of peculiar form, but as an object covering the figure or group, and into which the latter casts a shade, so that the figure or group may be as completely disengaged from the sides of the canopy as it appears to be in sculpture. It is not necessary that the back of the canopy should be made black as the back of a chimney, as in many modern works—there is a notable example of this mode of treating the canopy niches in the ante-chapel of Wadham College—but that an idea of hollowness should be conveyed by perspective and transparent shadow. There is no reason why the back of the niche should not be pierced with open windows, as in many ancient examples, provided a sufficiently strong shadow were thrown under the roof to bring the figure forward, according to the Cinque Cento arrangement of shadows. The old Decorated canopies are frequently so large as completely to overpower the subject placed under them, whilst many of the Perpendicular examples are too rigidly architectural to be pleasing. It would certainly be very desirable to make the canopies in all cases contribute to the effect of the picture as thoroughly as in Cinque Cento glass paintings. Whenever a figure and canopy window, or any design containing large figures, is intended to be seen from a great distance, it is advisable that the figure should either be light on a dark ground, or else richly coloured on a white ground ; for however strongly shaded it may be, the outline of the masses of colour only will be seen from a great distance, consequently the effect will be confused if the outline of the mass of colouring does not coincide with the outline of the figure. This defect is observable even in many Cinque Cento figure and canopy windows, in which it is impossible at a distance to distinguish the figure from the background. Windows so constructed, when the details of the painting are lost in distance, are apt to appear, not like a mosaic, for the pieces of which they are composed are of too large a size, but like a mere congeries of ill-shapen pieces of glass. With regard to small pictures inserted into pattern windows, it would be better to treat them as pictures on mere coloured panels, as, for instance, in the chapter-house at York, than as groups or single figures under canopies, as in Merton Chapel.

Louis Laguerre.

As the assistant and imitator of Verrio, Louis Laguerre's name will be preserved through being immortalised by that unpropitious line of Pope, "Where sprawl the saints of Verrio and Laguerre." The same redundancy of history and fable is displayed in the works of both, and it is but justice to say that their performances were at least in as good a taste as the edifices they were appointed to adorn. Laguerre's father was a Catalan, who settled in France and became master of the menagerie at Versailles. The son being born at Paris in 1663 Louis XIV. did him the honour of being his godfather, and gave him his own name. He studied in the royal academy of painting, and for a short time under Le Brun. In 1683 he came to England with one Ricard, a painter of architecture, and both were employed by Verrio. Laguerre painted for him most part of the large picture in St. Bartholomew's Hospital, and succeeding so well when little above twenty, he rose into much business, executing great numbers of ceilings, halls and staircases, particularly at Lord Exeter's at Burleigh, the staircase at old Devonshire House in Piccadilly, the staircase and saloon at Buckingham House, the staircase at Petworth, many of the apartments at Burleigh-on-the-Hill, where the walls are covered with his Cæsars, some things at Marlborough House in St. James's Park, and, which is his best work, the saloon at Blenheim. King William gave him lodgings at Hampton Court, where he painted the "Labours of Hercules" in chiaroscuro, and being appointed to repair the "Triumphs of Julius Cæsar," by Andrea Mantegna, he had the judgment to imitate the style of the original instead of new clothing them in vermilion and ultramarine, a fate that befel Raphael even from the pencil of Carlo Maratti. Laguerre was at first chosen unanimously by the commissioners for rebuilding St. Paul's to decorate the inside of the cupola, but was set aside by the prevailing interest of Thornhill, a preference not ravished from him by superior merit. Sir Godfrey Kneller was more just to him, though from pique to Thornhill, and employed him to paint the staircase of his house at Witton, where Laguerre distinguished himself beyond his common performances. On the union of England and Scotland he was ordered by Queen Anne to make designs for a set of tapestry on that occasion, in which were to be introduced the portraits of her majesty and the principal ministers ; but though he gave the drawings the work went no farther. A few pictures he painted besides, and made designs for engravers. In 1711 he was a director of an academy of painting erected in London, and was likely to be chosen governor on the resignation of Kneller, but was again baffled by his competitor Thornhill. In truth he was, says Vertue, a

modest unintriguing man. At a tavern in Drury Lane, where was held a club of virtuosi, he painted in chiaroscuro round the room a Bacchanalian procession, and made them a present of his labour. Vertue thinks that Sir James Thornhill was indebted to him for his knowledge of historic painting on ceilings, &c., and says he was imitated by others, as one Riario, Johnson, Brown, and several whose names are perished as well as that gaudy style. Laguerre towards his latter end grew dropsical and inactive, and going to see the "Island Princess" at Drury Lane, which was acted for the benefit of his son, then newly entered to sing on the stage, he was seized with a stroke of apoplexy, and died before the play began, April 20, 1721. He was buried in the churchyard of St. Martin's-in-the-Fields.

Expressiveness of Lines.

Lines differ either in regard to their nature or their direction. 1. Lines differ in regard to their nature according to the different degrees of their consistence or strength. Strong and vigorous lines are expressive to us of strength and stability when perpendicular, and of some degree of harshness or roughness when horizontal or in an oblique direction. Fine and faint lines are expressive to us of smoothness, fineness, delicacy. In any given number of straight lines, that is always most beautiful which is finest, or which, while it preserves its continuity, has the appearance of the smallest quantity of matter employed in the formation of it. Hence, in every subject, either of art or nature, one of the principal causes of the beauty of delicate outline. 2. Lines differ in their direction in two ways. They are either even or uneven; that is, straight or irregular. Irregular lines differ again; they are either in angles or curves. 1. Even lines are expressive to us of softness and smoothness. 2. Uneven lines are either angular or winding. Angular lines are expressive of harshness, roughness, &c. Winding lines of pliancy, delicacy, ease, &c. The real and actual beauty of lines will be found to correspond to those associations, and those are in fact the most beautiful which have the most pleasing or affecting expression. 1. Strong and even lines express strength and smoothness. They have, therefore, a degree of beauty. Fine and even lines express delicacy and smoothness. They are accordingly more beautiful than the former. 2. Strong and angular lines express strength and harshness. They are therefore very seldom beautiful. Fine and angular lines express delicacy together with roughness. They are beautiful, therefore, only when the expression of delicacy prevails over the other. 3. Strong and winding lines express strength and gentleness or delicacy. Their effect is mutually destroyed, and they are accordingly indifferent, if not unpleasing. Fine and winding lines express delicacy and ease. They are accordingly peculiarly beautiful. 4. The least beautiful lines are strong and angular lines. The most beautiful, fine and winding lines. Considering, therefore, lines in this abstracted view, and independent of the nature of the bodies which they distinguish, it seems very natural to conclude that those forms will be the most beautiful which are described by the most beautiful lines, and that of consequence the serpentine or winding form must necessarily be the most beautiful. It was this view of the subject which seems to have influenced Hogarth in the opinions which he published in his "Analysis of Beauty." He saw clearly, and his art afforded him continual proofs of it, that the winding line was of all others the most beautiful. He conceived, therefore, that all forms must be beautiful in proportion to the predominance of this line in their composition; and his opinion falls in so much with the general observation of mankind that it has been very universally adopted.

The Soul's Awakening in Artists.

How and at what period the love of art came upon Romney has not been clearly shown. Cumberland asserts that it was inspired by the cuts in the *Universal Magazine*. Hayley, who probably had the story from the painter, says that he consumed the time of his fellow-workmen in sketching them in various attitudes, while the artist's son states that Da Vinci's "Treatise on Painting," illustrated by many fine engravings, was early in his hands. All these stories may be true; genius draws its materials from many sources. The sight of a few fine prints in an obscure village in Yorkshire awakened the spark in Stothard, the carved figures in an old picture-frame did as much for Chantrey, and Wilkie's sense of the mingled comic and serious was first shown in drawing the head of one of his schoolfellows, who sat to learn his neglected lesson on that bad eminence the stool of shame. Romney himself used to relate that one day in church he saw a man with a most singular face, from which he could never take his eye. He spoke of it when he went home, and his parents desired him to describe the man. He took a pencil and from memory delineated the face so skilfully and with such strength of resemblance that they immediately named the person he meant, and the boy was so pleased with this that he began to draw with more serious application.

Scamozzi.

Concerning the professional merit of Scamozzi judgments have been different and extreme. Some, disgusted perhaps with his ostentation of extraneous erudition, his intimations of his own superiority and reticences concerning other artists, have refused him the praise justly due to him. The title of his work on architecture, "Idea dell' Architettura Universale di V. Scamozzi," and many passages in it, certainly indicate an extravagant opinion of his own sufficiency, but this does not prove that it had no support in real ability. His sixth book on the orders was thought to deserve a translation into French by Daviler, magnificently republished, with additions from other parts of the author's works by Du Ruy at Leyden, 1713. Of Scamozzi's book of antiquities the Marquis Maffei affirms that it is the only one where anything is said on the internal repartition and distribution of amphitheatres, and contains information on the subject never before given or sought for. Count A. Pompei praises Scamozzi's orders, and pronounces the designs in his book and many of his buildings highly commendable; among the latter he specifies the Palace Cornaro as a masterpiece of art. When he succeeded tothe direction of fabrics that were to be continued upon settled and well-concerted plans, it must be allowed that he was too prone to indulge his self-opinion in the attempt to do more than enough and better than well.

Doors.

According to the Italians, the principal door of a building has no determinate dimensions, but varies according to the grandeur of the building and its possessor or its use. Palladio agrees with Vitruvius that the height from the floor to the ceiling should be divided into three parts and a half, that two parts should be given to the height of the aperture, and to its breadth one, after deducting from it the twelfth part of the height. Muet proposes the least breadth of the principal door to be 7½ feet, the largest 12 feet. The height to be one and a half of the breadth, or rather the double of it. With regard to rooms, Palladio has laid down these rules for the doors. The least breadth of the aperture should be two feet, the greatest 3 feet, and the height agreeable to the least 5 feet; to the greatest 6½. Muet is of opinion that the least breadth should be 2½ feet, and the height, suitable to it, 5½. The breadth, from 3 to 4 feet, requires the height to be twice as much. In a royal palace the breadth of 5 or 6 feet may be allowed to the opening, and the height may be double of it, or sometimes less than double by a fifth or fourth part of the breadth.

GENERAL.

The Owen Jones Prizes have been awarded by the Society of Arts to Emmet Brady, School of Art, Glasgow, for design for wall-paper; William F. G. Brown, School of Art, Glasgow, design for printed velvet; James Grimstone, School of Art, Glasgow, designs for wall-paper; Ethel Hedgland, School of Art, Dover, designs for parasol cover and Zouave jacket in cut linen; Florence S. K. Joyce, School of Art, Birmingham, modelled design for a finger-plate; Fred. Charles Kiefer, School of Art, Battersea, designs for printed muslin. The next award will be made in 1899, when six prizes will be offered for competition.

The Trustees of the National Gallery have purchased two Rembrandts from Lady de Saumarez. They are life-size portraits, one of an old man and the other of an old lady, both being seated and dressed in black.

Mr. Frederick Ashmead, consulting engineer to the Corporation of Bristol, has expired in his seventy-third year. He was borough surveyor for a long period.

The Gloucester School Board lately invited local architects to compete for a new school. Mr. Martin, of Birmingham, was appointed referee, and by his award the first prize was awarded to Mr. A. J. Dunn. By a majority of one it was, however, decided to appoint Mr. Medland to carry out the work.

The Papers on Perpendicular architecture as exhibited in the churches of Somersetshire, which were read before the Somersetshire Archæological Society by the late E. A. Freeman, are to be reprinted in a forthcoming book on "The Church Towers of Somersetshire."

Castle Visconti, near Treviglio, which Manzoni adopted as the residence of the heroine in his romance of "The Betrothed," has been sold to a society for the sum of 102,000 francs. The castle is very ancient, and is surrounded on all sides by broad moats.

Mr. John Simmons, of Doncaster, has been appointed consulting engineer for the Ongar Drainage Scheme.

Madame Garnier has presented to the treasury of the Paris Opera House the collection of painters' sketches for the adornment of the building. They are to be arranged in the library about a medallion in mosaic of Charles Garnier.

The Exhibition of French pictures in the Guildhall Gallery has been visited by 203,000 people.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITIONS OPEN.

LIVERPOOL.—Oct. 3 (time extended).—Designs for new buildings for Royal Institution (50 guineas, 20 guineas). Mr. Harold Waterhouse, hon. sec., 3 Cook Street, Liverpool.

REIGATE.—Oct. 6.—Designs for Municipal Buildings (limit 15,000*l.*, premiums 50*l.*, 30*l.* and 20*l.*). Particulars from C. J. Green, town clerk, Station Road, Redhill.

WIVENHOE.—Sept. 29.—For water supply and drainage schemes. Particulars from C. W. Denton, 8 East Stockwell Street, Colchester.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For additions and alterations to the Station Hotel, Warrington Street. Messrs. John Eaton, Sons & Cantrell, architects, Ashton-under-Lyne.

BARRY.—Sept. 5.—For erecting new girls, boys and infants' schools at Hannah Street, Cadoxton-juxta-Barry, for the Barry School Board. Messrs. J. P. Jones, Richards & Budgen, architects, 18 St. Mary Street, Cardiff.

BLACKBURN.—Sept. 12.—For alterations at the slaughter-houses, for the health committee. Mr. William Stubbs, borough engineer, Municipal Offices.

BLYTH.—Sept. 3.—For new theatre at Blyth, for the Blyth Theatre Company, Limited. Messrs. Wm. Hope & J. C. Maxwell, architects, Newcastle-on-Tyne.

BURY ST. EDMUNDS.—Sept. 10.—For erection of buildings, chimney shaft, &c., for the electric-lighting station. Mr. F. Hastings Medhurst, Westminster Chambers, 13 Victoria Street, S.W.

CARDIFF.—Sept. 12.—For erection of three new pavilions, lodge and contingent works at the sanatorium, for the Corporation. Mr. W. Harpur, borough engineer.

CROMER.—Sept. 10.—For erection of public conveniences, comprising accommodation for both sexes, with cloakroom and adjuncts, on the sea front. Mr. A. F. Scott, surveyor to the Council.

CUMBERLAND.—For reslating and lathing of a large mill at Egremont. The Wyndham Mining Company, Limited, Egremont.

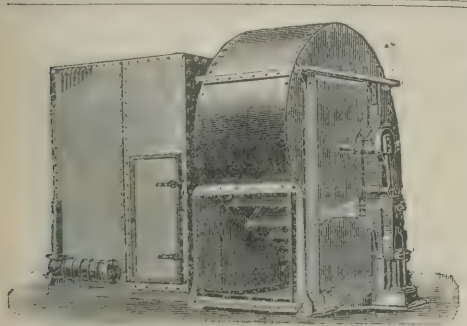
DARTMOUTH.—Sept. 10.—For converting house and premises in Foss Street into shops, &c. Mr. E. H. Back, architect, Dartmouth.

DERBY.—Sept. 7.—For erection of brick boundary wall on north side of land recently acquired for extension of Nottingham Road cemetery. Mr. John Ward, surveyor, Babington Lane, Derby.

DEWSBURY.—Sept. 5.—For works required in alteration of the West Riding Union Bank premises. Messrs. John Kirk & Sons, architects, Dewsbury.

DEWSBURY.—Sept. 6.—For whole or any portion of the works required in the rebuilding of the Dyer's Arms, Westgate, Dewsbury. Mr. J. Lane Fox, architect, Bond Street, Dewsbury.

DEWSBURY.—Sept. 12.—For various fittings, counters, cases, &c., required for fitting up the drapery and millinery departments, for the Dewsbury Pioneers' Industrial Society, Limited. Messrs. Holtom & Fox, architects, Dewsbury.



DOVER.—Sept. 13.—For erection of workshop, &c., adjoining car shed at Maxton. Mr. Henry E. Stilgoe, Town Hall, Dover.

DUKINFIELD.—For erection of the Town Hall. Messrs. John Eaton, Sons & Cantrell, architects, &c., Stamford Street, Ashton-under-Lyne.

DURHAM.—For erection of three shops and two houses in Front Street, Stanley. Mr. William Forster, architect, Clifford Road, Stanley.

EDINBURGH.—Sept. 7.—For erection of public baths, Portobello. Mr. R. Morham, city superintendent of works, Public Works Office, City Chambers, Edinburgh.

ELLON.—Sept. 10.—For erection of an addition to the Gordon Hospital, Ellon, from plans by County Engineer.

STURTEVANT SYSTEM
OF
Warming and Ventilating.
NO RISK OF FIRE.
PERFECT CONTROL OF TEMPERATURE.
STURTEVANT ENGINEERING CO., 75 QUEEN VICTORIA ST., LONDON.

Enfield.—Sept. 20.—For erection of a junior mixed department and an infants' department at the Board school, Bush Hill Park. Mr. G. E. T. Laurence, architect, 181 Queen Victoria Street, London, E.C.

Epping.—Sept. 14.—For erection of a new ward at the isolation hospital, Theydon Garnon, and sundry works to existing buildings, with heating and hot-water supply. Mr. E. Egan, architect, Holmdale, Loughton.

Falmouth.—Sept. 10.—For erection of country residence at Swanpool, Falmouth, for Mr. T. J. Bouch-Tremayne. Mr. Horace W. Collins, architect, Redruth.

Godalming.—Sept. 20.—For erection of cemetery chapels and lodge at new cemetery grounds in Eashing Lane. Messrs. Welman & Street, architects, Church Street, Godalming.

Halifax.—Sept. 10.—For additions to premises of Campbell Gas-Engine Company, Limited. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

Hull.—For erection of a saleroom for Messrs. Lewendon & Son. Messrs. Smith, Brodrick & Lowther, architects, York Chambers, 77 Lowgate, Hull.

Kew.—Oct. 3.—For removal of existing bridge and construction of new masonry bridge over the river Thames, together with alterations of approaches and construction and subsequent removal of temporary bridge over the river. Sir John Wolfe Barry, K.C.B., and Mr. C. A. Brereton, engineers, 21 Delahay Street, Westminster.

Kidderminster.—For additions to the Park Wharf Carpet Manufactory, Park Lane. Mr. J. M. Gething, architect, Oxford Chambers, Kidderminster.

Ladywell.—Sept. 3.—For the formation of a new exit, alteration in existing doorways, and other works at the public baths. Mr. Edward H. Oxenham, clerk, Lewisham Town Hall, Catford, S.E.

Leeds.—For alterations and additions to 115 and 117 Burley Road. Mr. Fred. Mitchell, architect, Safe Deposit Chambers, Albion Street, Leeds.

Leeds.—For extension of Messrs. Harding, Richardson, Rhodes & Co.'s premises, including engine and boiler-houses, and covering 5,200 yards. Mr. William Bakewell, architect, 38 Park Square, Leeds.

Leek.—Sept. 21.—For erection of municipal science and technical school and county silk school. Messrs. William Sugden & Sons, Leek.

Lewes. — Sept. 23. — For erection of two temporary buildings for 100 patients, and for other works in connection therewith, at the East Sussex County Lunatic Asylum. Mr. Henry Card, county surveyor, County Hall, Lewes.

London.—Sept. 12.—For erection of 12 cottages at Winchmore Hill, N., for the Southgate Urban District Council, from plans by Council's surveyor.

London —Oct. 12.—For erection of a new laundry at the workhouse in the Fulham Road, West Brompton, S.W. Mr. Edwin T. Hall, architect, 57 Moorgate Street, E.C.

London.—Sept. 17.—For erection of a block of school buildings and appurtenances for infants on site adjoining the existing schools, Cuckoo Lane, Hanwell, Middlesex, for the managers of the Central London School District. Messrs. J. T. Newman & Jacques, architects, 2 Fen Court, London, E.C.

Manchester.— Sept. 7. — For alterations at schools at Swinton, for the Guardians. Mr. A. J. Murgatroyd, architect, 23 Strutt Street, Manchester.

WANSFORD.

For alterations and additions to a house in Wansford. Mr. J. C. TRAYLEN, architect, Stamford.

L. C. Gilbert, Wansford	£235 0 0
COATES & SON, Thrapston (*accepted*)	210 0 0

ELECTRIC NOTES.

AN agreement has been arranged between the Leeds Corporation and the Yorkshire House-to-House Electric Supply Company for the transference of the company's business. The capital expenditure from which the company shall benefit is to cease on September 1. From that date all capital expenditure will be for and on behalf of the Corporation. The second provision is that the company shall receive all the earnings up to September 30, which is the usual quarter end. This being the case, the company will only begin to receive interest on any unpaid purchase-money from October 1. The date definitely fixed for handing over Corporation scrip and cash to the company in payment for their concern is November 15. The worth of the stores is to be ascertained by valuation, the Corporation and the company each appointing a valuer. It is further provided in the agreement that the Corporation shall take and pay for the book debts, the latter being guaranteed by the company. The Corporation will take over contracts, wayleaves and other matters. In regard to the purchase-money the Corporation have, as is known, obtained Parliamentary sanction to the issuing of Five per Cent. Irredeemable Stock for the amount properly expended on capital account and cash for book debts, stores, &c.

THE minutes of the joint committee of the Kirkaldy Town Council and the promoters of the local company on the subject of tramways and electric light have been issued to the members of Council. The minutes contain a report from Professor Kennedy, in which he recommends that a tramway route should be limited to that beginning at the public park, proceeding to near the station, down Wemyssfield to High Street, thence proceeding along High Street, Nether Street and St. Clair Street to the northern end of Sinclairtown. The length of the route is three miles. The total cost, including plant, buildings and mains required for electric lighting, he puts down at 60,000*l*. The committee, however, after examination of the figures, are of opinion that they did not see their way to make any recommendation to the Town Council in regard to the proposed scheme. They resolved to lay before the Council an abstract of the figure that they had before them, and the clerk was instructed to prepare such an abstract, and to issue it to the Council along with the minutes. The town clerk has also issued a long letter to the members of Council expressing his opinion that he would strongly recommend the Council not to take up at the present time a combined scheme of tramways

and electric lighting, but to consent to private companies taking up the scheme of electric lighting and tramways.

THE Grimsby Corporation have adopted an electric-lighting scheme at an estimated cost of 40,000*l.*, which sum includes provision for an electric tram service.

AN inquiry has been held before Colonel A. C. Smith, R.E., representing the Local Government Board, at Leyton, as the Urban Council have applied for authority to borrow 5,000*l.* for electric lighting. Already the expenditure amounts to 29,480*l.*, and the demand for the light is increasing.

ELECTRIC light is now employed in the library and assembly hall of the French Institut in Paris. It is anticipated that the light will be introduced by degrees in other parts of the building.

THE electric lighting of the committee-rooms of the Houses of Parliament will be completed during the recess. The delay was caused by a doubt as to the best method of placing the incandescent lamps. It has now been practically demonstrated that the fixed electroliers near the ceiling give a more satisfactory result for writing purposes than shaded lamps which can be lowered at will, and consequently the former will be fixed wherever more light is needed.

MOUNT EPHRAIM, Tunbridge, has been illuminated by electric light, and has therefore gained in attractiveness. There are ten lofty pillar lights on each side of the promenade alternately, and twenty lesser lamps, half as high, on the same pillar posts. This triple method of lighting the whole length of Mount Ephraim floods the paths and carriage drive with light, and the nightly scene is a striking one in all directions. It is said that the lights on Mount Ephraim can be seen distinctly as far into East Sussex as Crowborough Beacon one way and Frant village by way of the Forest.

TRADE NOTES.

MESSRS. W. SCUPHAM & SONS, LIMITED, have just perfected their patent drawer knob machine, and can now promise prompt delivery of the largest orders. They already do a large shipping trade in addition to the home factors.

THE new workhouse infirmary, Merthyr Tydfil, is being warmed and ventilated by means of Shorland's patent Manchester stoves (some double-fronted and some single-fronted) and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

BUILDING AND BUILDERS.

MESSRS. G. & R. COUSIN, contractors, Alloa, have been successful in securing the contract for a large addition to the Waverley Station Hotel, Edinburgh. The estimated cost is stated at between 50,000*l.* and 60,000*l.*

WORKMEN'S dwellings are to be erected in Southampton according to plans to be prepared by Mr. Hair.

A STATION hotel costing 4,000*l.* is to be erected by the South-Eastern Railway Company at Whitehall, Crayford, for the accommodation of the men employed at the engine works.

A LARGE hotel, to cost nearly 70,000*l.* and accommodate 160 guests, is about to be erected at Lowestoft by Spiers & Pond, Limited.

THE Lichfield Guardians are now considering plans by Mr. W. H. Woodroffe for an extension of the workhouse buildings.

THE Great Western Railway Company have sanctioned the erection of the proposed Jubilee Memorial clock tower at the railway station approach, Maidenhead, and have approved of Mr. E. J. Shrewsbury's design for the memorial.

THE New Schultze Gunpowder Company, Limited, of 28 Gresham Street, London, and of Fritham, Lyndhurst, manufacturers of explosives, have applied to the Hants County Council for their assent to the establishment of a factory for explosives on the premises known as the Ballast Hole, or Old Gravel Pit, at Rumbridge, Totton.

THE old town hall, Henley, has been sold, as a new building is about to be erected. The town hall was built in 1796 by Mr. William Bradshaw, a member of the then local authority. Possession for the purpose of pulling-down and clearing the site will be given on September 12, and the whole is to be absolutely cleared on October 8.

THE public health committees of the local authorities of the burgh of Arbroath and the Arbroath district of Forfarshire, to whom the matter was remitted, have approved of erecting a joint epidemic hospital to supersede the present hospital belonging to the burgh, which is closely environed with dwelling-houses and by the Infirmary. A sub-committee has been appointed to look out for a suitable site.

ACTON Church, Nantwich, which is one of the oldest edifices in the country, has been reopened after undergoing extensive alterations. The nave has been completely restored at a cost of nearly 6,000*l.*, which is being defrayed by an old parishioner,

77 OXFORD STREET, W.
PRICE LIST AND ESTIMATES ON APPLICATION.

Mr. Sutton Timmis, of Liverpool, to whom the parishioners are presenting valuable silver plate. Lord Tollemache, patron of the living, has borne the cost of restoring the chancel, and Mr. Henry Tollemache, M.P., has defrayed the expense of the erection of the new organ-chamber.

THE Worcester plasterers are out on strike. They asked for an additional penny per hour, which was refused by the employers on the ground that the state of the trade does not warrant it. The strike has caused some inconvenience to the builders. The men for some time past have been agitating for the employers to agree to a new code of rules, which would entitle them to an advance of wages for overtime, and would place them upon the same terms as regards rules as masons and bricklayers. The masters were willing to sign this code, and are still willing to do so, but they do not see their way to give the increase of one penny per hour, and they also consider it unreasonable at this time of the year.

VARIETIES.

THE Corporation of Aberdeen have paid the purchase price 84,734*l*, for the tramway system in use in the city.

A HIGHER Grade school has been opened at Heckmondwike which cost 18,000*l*. The architect is Mr. A. A. Scott.

AN illustrated pamphlet is being issued by the Great Eastern Railway Company descriptive of the beauties of the Cromer district.

IT is proposed to reconstruct the Aberdeen Graving Dock at a cost of 125,000*l*. The project comes from the works committee and awaits the approval of the Harbour Board.

THE Dundee Foresters have purchased a large property in the town and intend to erect a capacious hall for public meetings, besides suitable halls for the use of the order, shops, &c.

MESSRS. P. & W. MACLELLAN, of Glasgow, have obtained the contract for supplying 1,000 tons of tramway rails to the Glasgow Corporation. There were several German tenders.

THERE are at present in London 37,000 people living five in one room, 17,000 people living six in one room, 6,000 living seven in one room, 1,800 living eight in one room, 32,000 living eight in two rooms, and 14,000 living nine in two rooms.

THE Clacton-on-Sea Urban Council have resolved that any householder requiring a supply of salt water for the purposes of baths, flushing, &c., shall be allowed to connect with the sea-water main, where convenient, free of charge.

A PROJECT is under consideration for securing the waters of the Upper Derwent for the supply of Mid-Derbyshire, the Corporation of Derby, Nottingham, Leicester and Sheffield, at a cost of 3,000,000*l*, to yield 14,000,000 gallons per diem.

COLSTON HALL, where the Trades Union Congress was held in the early part of the week, was destroyed by fire early yesterday morning. The meetings of the British Association were to be held in it on Wednesday next and succeeding days.

ABOUT 150 of the employés of Messrs. W. Scupham & Sons, Limited, the well-known timber merchants, &c., have just had their annual outing. This year Bridlington was visited, and fine weather contributed to a very enjoyable day. There can be no doubt that these little outings place employers and employed on a better footing.

THE River Wear Commissioners at Sunderland adopted on Wednesday a scheme for quay and dock extensions to cost 261,000*l*. This is in addition to the works in progress, which raise the total cost to 375,000*l*. The object is to provide accommodation for the large steamers which are now being generally ordered by shipowners.

THE Master Plumbers and Plumbers' Union of Ottawa have appointed a committee to interview the Council and learn why the plumbing by-law passed in 1893 has not been enforced. The by-law calls upon every master plumber to take out a license at 2 dols. per year, and to give a bond of 200 dols. as a guarantee of good work; the license fee for journeymen plumbers is 25 cents. It is claimed that the health of the citizens has suffered because of defective plumbing-work done by incompetent and irresponsible firms, and the Council will be urged to enforce the law for the future and to incorporate in it a provision that iron pipe in houses should be carried through the foundation and protected by a stone arch, so that when the foundation sets the drain still remains unimpaired.

MR. G. FRAMPTON, A.R.A., has had the honour of submitting for the Queen's inspection a small plaster cast of the colossal statue of Her Majesty to be placed in front of the Government House, Calcutta, by the British and native inhabitants of India, in commemoration of the Queen's Diamond Jubilee.

OFFICE, COLLEGE OF ARMS.

WIRELESS TELEGRAPHY.

A LECTURE was delivered in the theatre of the Royal Dublin Society by Monsignor Molloy, D.D., D.Sc., on "Signalling through Space by means of Electric Waves, without the aid of Wires." He began by observing that in the ordinary electric telegraph the electric energy generated at one station was conveyed to another by means of a wire, through which it was conceived to flow as a river flowed through its channel. But in the system of wireless telegraphy as developed by Signor Marconi, the electric energy went out in all directions from the sending station and travelled freely through space in the form of electric waves as light went out from the candle, or as the sounds of the human voice went out from the organs of speech. It seemed to him therefore that he should best meet their wishes if he began by trying to give them some clear conceptions about the nature of these electric waves, sketching briefly the history of their discovery, and bringing forward some experimental evidence to prove their existence. Afterwards he would show how these waves might be used to convey signals through space, and he would explain the construction and action of Signor Marconi's apparatus. At the end they would have an opportunity of seeing the apparatus at work and of sending messages through it. It would help them very much to form a distinct conception of electric waves if they first glanced for a moment at the more familiar phenomena of the waves of sound and the waves of light. It was by means of waves of sound that they heard his voice. As he spoke he put the vocal cords of his throat into vibration; each swing of the vocal cords produced a disturbance of the air in contact with them; and as vibration followed vibration, a succession of disturbances or impulses was produced which travelled outwards and away, in all directions, until they reached the ears of the audience, and there awakened the sensation of sound. In like manner, light was transmitted from a luminous body through space, in the form o a series of impulses or waves, which, passing through the pupil of the eye struck upon the retina, and awakened the sensation of vision. In both cases a medium was necessary through which the vibrations could be transmitted; the medium for the waves of sound was air, the medium for the waves of light was a far more subtle medium, which was supposed to pervade the whole universe, and which was called ether. Sound waves travelled at the rate of 1,100 feet a second; light waves at the rate of 186,000 miles a second. Turning then to electrical energy, the lecturer showed how the existence of electric waves was, at first, only a conjecture or hypothesis, based on the analogy of sound and light and radiant heat; then, in the hands of Clerk-Maxwell, it was raised to the dignity of a theory, supported by mathematical reasoning; and, lastly, it was conclusively demonstrated by the experiments of Hertz. He explained the general principles on which the experiments of Hertz were conducted, and exhibited in a manner visible to the whole audience the well-known experiments on electrical resonance. This principle afforded a very delicate means of detecting the presence of electric waves. Various forms of apparatus had been devised which responded to the action of electric waves, and which might be called by the general name of electric resonators. The most sensitive of all was due to Professor Branly, of Paris, and was discovered, in the first instance, by a sort of lucky accident. It consisted simply of a glass tube filled with brass or copper or iron filings. In its normal condition the tube was practically a non-conductor, but when struck by the electric waves it became a fairly good conductor. Hence if it were placed in the circuit of a battery no current would pass so long as the metal filings remained in their loose, incoherent condition. But no sooner did the electric waves come in from a distant station than the filings were welded together by the action of the waves and they became a conductor. The current then passed, and might be used to ring a bell, to deflect a galvanometer, or to work a Morse instrument at pleasure. This marvellous little piece of apparatus was called a coherer. The lecturer then showed a coherer at work, and used it for transmitting signals from one part of the platform to another. But this, he said, was only a laboratory or, at most, a lecture-room experiment. It required the genius of the inventor to lift it up into the sphere of practical utility and to extend the distance over which signals could be sent from a few yards to many miles, and the inventor appeared in the person of Signor Marconi.

AMERICAN FIRE PROTECTION.

A REPORT, by Consul-General Sir D. Colnaghi, on the fire department of the city of Boston, Massachusetts, has been issued. The Boston Fire Department, of which Colonel Russell is the present head, has control over an area of about 43 square miles, containing a population of about 500,000, or, roughly speaking, about the same as Birmingham. This area is divided into twelve "fire districts." The fire department, as at present constituted, is headed by a fire commissioner, appointed for three years by the mayor and eligible for reappointment. A chief of department is the executive officer of the commissioner, and when present has command at all fires. After him follow a first assistant chief, second assistant chief (acting also as district chief), eleven district chiefs, the superintendent and assistant-superintendent of fire alarms, and the usual clerks and officers required to carry out the work of the department. The active force comprises forty-five engine companies, including two double companies, two fire boats, seventeen ladder companies, twelve chemical engines, two water towers, one independent hose company, two combination waggons, chemical and hose, and three combination ladder companies, chemical and ladder. These companies are distributed through the twelve fire districts, each district being under the supervision and command of a district chief. The total force of the department in uniformed and ununiformed men is 849. A captain, lieutenant and ten men constitute an average engine or ladder company. Every man is ready for duty at a moment's notice for twenty-one hours out of the twenty-four, the three remaining hours being reserved for meals. Implicit obedience to superior officers is required, and men, horses and apparatus are kept under constant inspection and drill. In joining the Boston Fire Department to-day a man enters upon a life profession. The thorough preparation that he goes through insures, as far as possible, a man perfectly fit, physically and otherwise, for the duties he will have to perform. After the candidates have been conditionally appointed they enter the department drill school, where each new member must serve thirty days, being put through the whole manual of apparatus and equipment, and his courage, strength and endurance tested by actual experience in the line of his duty, with the exception of the fire and smoke. These drill schools are considered imperative for the training of firemen in all large American cities.

Distributed throughout the city in convenient localities are 601 fire-alarm boxes, connected electrically with the fire-alarm office in the department headquarters, where night and day two operators are on duty to receive all alarms of fire sent from the boxes and repeat them to the different engine-houses. The keyless fire-alarm boxes are painted a bright red, and many have also a lamp showing a red light. On turning the large handle on the outside of the box a loud gong sounds in the inside. This is simply a warning to citizens that the box is being opened, so as to guard against false alarms by mischievous persons. The turning of the handle opens the door, but inside is a second door with a hook projecting from a slot in the centre. By pulling down this hook once and letting it go the alarm is sent into department headquarters, whence it is at once notified to all the department houses in Boston. In order, however, that the men may not be unnecessarily disturbed, in many of the engine-houses in the city proper there is a small bell, just loud enough to be heard by the house patrol. When the alarm comes in this bell strikes the box number, and the patrol immediately ascertains whether the number is one to which the company does or does not respond. In the latter case the gong is switched off, and the company is not disturbed, otherwise the gong rings. At its first blow the patrol pulls a lever which mechanically opens the stable doors and releases the horses, so that they may run out under the harness of the apparatus to which they belong. The men come rushing down the sliding pole and stairs. Drivers take their seats, the collars are snapped on the horses' necks, and by this simple action and the pulling of a cord they are harnessed; the patrol announces the box number, the engineer lights the fire under the boiler, the captain gives the word "go," and jumps on to the engine with the two engineers, the lieutenant and the rest of the company following on the hose waggon. All this is done in about ten seconds. One and a half minutes have elapsed since the first alarm was sounded when the man at the box sees an engine followed by a hose waggon, ladder truck and chemical coming towards him, and he indicates the position of the fire. The captain of the engine, who is thoroughly acquainted with the hydrants in his district, immediately places his engine. In the meantime the district chief has arrived, and his driver, who is a telegraphist, goes to the box, and, by means of the Morse key it contains, notifies fire alarm headquarters that he is there. In this way the officer in chief command at the fire has communication by telegraph with the rest of the department. If the fire threatens to get beyond control the officer in command orders a second alarm. The operator at headquarters repeats it by striking

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.

two blows on the gong followed by the box number, to warn the houses. Again, the officer in command at the fire can telegraph from the alarm box for any number of companies he may want.

With the apparatus on duty at a large fire a section of the city would be left unprotected were it not for the system in force of covering the denuded territory. Thus, in the event of a fire requiring a second or third alarm, the companies in the adjacent districts move to the houses of those companies which have responded to the call. There are two maps of the city with pegs in them indicating the location of the companies at the engine-houses, one at the night headquarters of the chief of department and one at the fire-alarm office. The pegs in these maps representing the companies that have responded to the first, second, third and perhaps following alarms are taken out, and the pegs representing the covering companies are put in their places. Thus by means of these maps and a running card (which is an assignment of companies) it is easily to be seen how the city has been left protected. Care is taken not to leave any one district absolutely defenceless.

The Consul-General gives a list of the engines, steam and chemical, hose, ladder, trucks, water-towers, &c., in service. The new horseless propellers, which have given very satisfactory results, have a capacity of 1,350 gallons per minute. The ladder trucks are a very useful arm. They carry ladders from 10 feet to 65 feet in length, and are fully equipped with medicine chests, life-lines and a complete assortment of fire appliances. Five of these ladders are of the aerial pattern, which can be raised to a height of from 85 feet to 100 feet by means of cranks and a screw on a turntable. Fire-escapes of the English pattern are not in use, but life-saving nets are employed in the event of persons having to jump from a burning building. The water-tower consists of a cylinder set in a square case like a telescope and mounted on wheels. It can be raised perpendicularly by chemical or water pressure. The inner tube is then elevated by a gearing until it reaches the height of about 55 feet. Inside the tubing is a double length of hose, 3½ inches in diameter, connected at the lower end with six lines of hose from three engines, and at the top with a hollow arm or pipe which can be worked up and down and to the right and left by a man standing on the platform of the tower. When a fire is raging in the upper part of a high building water can be directed to each or any portion of its interior with great efficiency. Fires along the water front are difficult to handle, and it is here that the fire-boats render valuable service; their respective capacity is about 7,000 gallons per minute. Chemical engines form another useful piece of apparatus. They are always ready to go to work, the hose being light and easily handled. The capacity of the chemical engines in this department is from 50 to 100 gallons. They generally consist of two tanks, with the necessary appliances, hung on four wheels. On account of their lightness they are drawn with great speed to a fire. Carbonic acid is both the working and extinguishing agent. The total number of fires extinguished by the chemical engines in 1897 was 241. During the same year 472 fires were extinguished by the little hand or portable extinguishers. These are filled with water, soda and a small bottle of vitriol. By turning a small valve on the top of the extinguisher the bottle is broken, which causes a pressure sufficient for the play of water on the fire through a small hose. All appliances must be ready at all times for service and at any hour of the day or night. When through accident or otherwise anything becomes unfit for service the department repair-shop is ready at a moment's notice to repair or replace it. Connected with the repair-shop is a school of engineers, where the men with a liking for machinery are drilled in the handling of an engine. A school of telegraphy at which members of the force are educated in writing with the Morse key is also attached to the department.

SANITARY ASSOCIATION OF SCOTLAND.

THE annual Congress of the Sanitary Association of Scotland will be held this year in Rothesay. Opening on the evening of September 7 next with the annual business meeting, the Congress will extend over three days. On Thursday, September 8, after the presidential address has been delivered, a paper will be read and a discussion will take place on the vaccination question, and in the evening the annual dinner of the Association will take place. On Friday a paper will be read on "Women as Sanitary Workers" by Dr. Elsie Maud Inglis, Edinburgh, and a discussion will take place on the amendment of the Food and Drugs Acts, and in the afternoon Mr. A. MacKay Trotter, Glasgow, will read a paper on "The Housing of Cattle." Thereafter there will be a sail round the island of Bute, and next day the Congress proceedings will be brought to a close by a garden party at Mount Stuart House on the invitation of Lord and Lady Bute.

THE AVIEMORE RAILWAY.

AFTER being about seven years under construction, writes a special correspondent of the *Glasgow Herald*, there is now a prospect of this short cut over the Monaleadh mountains, between Inverness and Aviemore, being opened for through traffic in the first days of October. The delay in the completion of this railway is attributed to a variety of causes, the first perhaps being that the Highland Railway management were not for several years in too great a hurry to open a line which will have, in the first place, the effect of diminishing the annual revenue for passenger traffic. However that may be, the line has been a difficult as well as an expensive one to make, traversing as it does a wild and mountainous tract of country, and the substantial manner in which the work has been carried out to no small extent compensates for the delay which has taken place. The route selected means practically the saving of an hour in the journey from Perth to Inverness and *vice versâ*, so that henceforth the principal mail trains will take three hours instead of four to accomplish the journey. In other words, the total mileage between the two cities has been reduced by over 30 miles. Viewed as a whole, this railway, which is 34 miles long, is interesting from an engineering point of view, and it also takes the traveller through a stretch of country which has many attractive features. The first section of the line—that between Aviemore and Carrbridge—was opened as long ago as 1892. It passes through a finely-wooded undulating country, views being obtained on both sides of some of those huge plantations of fir by which the Earls of Seafield have done so much to bring back this region to something like its pristine sylvan grandeur. The only obstacle encountered by the engineers in this section was a peat moss in Crannich Wood, near the village of Carrbridge, which consumed 50,000 cubic yards of extra material before a solid foundation was obtained for the permanent way. Carrbridge, where the line attains the altitude of 914 feet above sea-level, already shows many signs of prosperity owing to the railway facilities which have now been supplied. Enjoying a bracing atmosphere, surrounded by dense pinewoods, built on a dry substratum of gravel and supplied with an abundance of fine spring-water, the situation is altogether a very desirable one, and is specially recommended for asthmatic people, for whom the aroma of the pine is considered beneficial. Villas are springing up rapidly, and the summer population of the village is this year considerably larger than in former seasons.

Beyond Carrbridge the expensive character of the line is at once apparent. First comes a bridge with a span of 180 feet, and standing 56 feet above the bed of the river Dulnan; then a long embankment 45 feet high, composed of 140,000 cubic yards of material, followed by an extensive cutting 50 feet deep, the excavation of which took about three years, the material cut through being almost exclusively hard mountain clay. The first bridge of any note on the route is that which carries the line through and across the gorge known as the Slochdmuick, a gloomy and desolate scene, which so recently as the middle of last century was infested by Highland banditti. The last leader of one of the gangs was the son of a small Highland proprietor, Mackintosh of Borlum, three of whose companions in crime were hung at Inverness in 1770 for an attempt to rob Sir Hector Monro of Novar. The railway crosses the gorge at right angles by a viaduct of eight arches, of 37 feet span each, at a height of 105 feet, and on a rising gradient of 1 in 70. It is 400 yards long. The granite of which the viaduct is built is native, and the sombre appearance of the structure is pleasingly relieved by the introduction of red sandstone facings. On emerging from the gloom of the pass the railway traverses a tract of wild, uninhabited country, which has little interest except for the sportsman. Five miles from Carrbridge, near the march between the parishes of Duthil and Moy, the summit level of the line (1,323 feet) is reached, and here occurs the Drumbain cutting, the largest on the whole line between Aviemore and Inverness, which means a work of great magnitude indeed. For a considerable portion of its length the depth is 56 feet, and by the time it was completed the amount of material excavated was calculated at 350,000 cubic yards. As the winter in this elevated region is generally so tempestuous that the work had to be suspended for four or five months at a time, it was a very formidable and protracted undertaking. At the upper portion of the cutting a great bed of moss was encountered, in which, at a depth of 25 feet, three successive crops of fir could be traced, each buried 3 feet under the other, showing that even in this exposed and inhospitable region, where there is not a twig now to be seen, Scotland was once tree-clothed. Skirting the hill-side, with a falling grade, the line enters the heart of the Mackintosh country and the beautiful valley of the Findhorn. To carry the railway across the Findhorn river and valley two viaducts were necessary, the first being exceptionally large and lofty. It is formed by a steel superstructure resting on granite piers, and is 445 yards in length. There are nine spans each of 130 feet, with landward

MACKIE'S PATENT "DEFIANCE" HYDRAULIC WATERTIGHT FLOOR SPRING AND CHECK.

Size of Plate, 12 × 8 in.
Size of Box, 10¾ × 6 × 3¾ in.

906
80/-
With top centre and brass shoe any size.

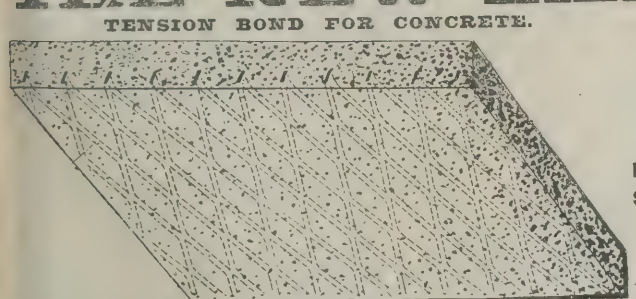
This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

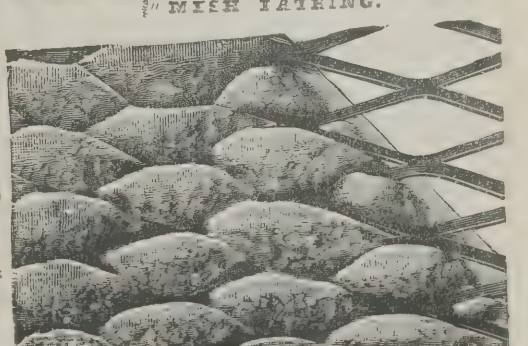
The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT E.C.
Architects and Buyers are respectfully invited to inspect same.

arches of 36 feet at each end. The height from the bed of the river to the rail level is 140 feet. The whole viaduct is on a curve of half a mile radius, and has a grade of 1 in 60, falling northwards. Farther on is another viaduct constructed of stone and consisting of nine arches of 36 feet span, with lengths varying from 40 feet to 80 feet. The style adopted for these two viaducts is rather ornate, with the result that they add to rather than take from the picturesque appearance of the valley. Near by, embowered among trees, is Tomatin station, the offices, like all the other stations on this line, being built of stone and substantial and commodious. A mile or two further on is Moghall station, situated opposite one of the entrances to the policies of the handsome residence of the Mackintosh of Mackintosh. Glimpses of the mansion and the historic loch close by are obtained from the railway. The Mackintosh has, by the way, done much by judicious planting to improve the appearance of the country round about, there being several flourishing in plantations. Between Moy and Devoit, in the Nairn Valley, there is a stretch of bleak country, famous, however, in local history, one point, known as the threshold of the highlands, being the scene of the rout of Moy after the battle of Culloden. Davoit station is perched on an embankment 30 feet in height (135,000 feet of material) high up on a spur of the Monadhliadhs, and commands one of the grandest and most extensive views of scenery to be found on the Highland Railway.





With the huge bulk of Ben Wyvis as a centre-piece, the panorama embraces the Caithness hills and the great expanse of the North Sea, while the dome-like top of Mealfournie closes in the picture in the west. Up to this point the line is a single one, although all the viaducts and bridges are made for a double set of rails; for the remaining ten miles to Inverness it is double, so as to facilitate the departure and arrival of traffic. Rounding the shoulder of the hill, now in deep cutting and now on high embankments, the line descends into the Nairn Valley, which it crosses by a viaduct of a remarkably striking character. It is approached on each side by embankments 50 feet high, and containing between them 300,000 cubic yards of material. The viaduct is 600 yards long and consists of twenty-eight arches of 50 feet span and one of 100 feet, the latter being over the bed of the river, above which the rail level attains 120 feet. The viaduct is entirely built of stone, the greater proportion of which was obtained from a quarry near by. Half of the structure is built straight and the other half on a curve of half a mile radius, with a grade of 1 in 60. Altogether it is a formidable and very graceful piece of stonework, in which the late Mr. Murdo Patterson, the company's engineer—who died within sight of it—justly took great pride. About 600 yards farther on is Culloden Moor station, itself being about three-quarters of a mile to the west. A mile of cutting, 30 feet deep on an average, takes the line through the Culloden woods, after which, on an embankment which at places is 50 feet in height, the descent is made into the Highland capital. The approach is far more picturesque than by the present route along the shore level of the firth, and is sure to strike the visitors with admiration, the old description of Inverness as a town cradled among mountains being vividly realised. In the whole length of 34 miles there are no fewer than 150 bridges of various sizes, four viaducts, two of them being exceptionally large, while the total amount of earth material dealt with was over two million cubic feet. Though the gradients up and down are frequently 1 in 60, the curves have been made on an easy radius, and fast running with through trains is intended. This season there was a great congestion of traffic, the number of visitors to the Highlands being much in excess of previous years, and this alternative route will afford a much-needed relief, while it opens up a stretch of country which is sure to attract persons in search of bracing health resorts.

NEW DOCK AT GRANGEMOUTH.

THE Caledonian Railway Company are at present completing arrangements for increasing their dock accommodation at Grangemouth to an amount equal to treble its present extent. The new dock will be situated between the old dock and the Forth, and will occupy the foreshore lying immediately to the south of the river Carron. Between the old dock and the entrance the extreme distance is about a mile and a half. Included in this space, besides the new dock, there will be two channels, one called the eastern channel, connecting the dock with the Forth, as above stated. In this channel, about half-way between the entrance lock into the dock and the sea, there will be a large canting basin. Above the new dock the other or western channel will be made, giving access from the new dock to the old docks. About one-half the area to be thus occupied consists of foreshore, which is under water at full tide. The first operation therefore to be performed in the construction of the dock will

be the excavation of the dry material lying to the west above high-water mark, and the driving of an embankment around the whole of the space to be reclaimed from the firth, and which will be occupied by the channels, canting basin, sidings, and other accommodation necessary for the working of the railway traffic. When the tide has been thus excluded, and the impounded water pumped out, the building of the dock walls and the entrance channel will be commenced. The method of building the enclosing walls of the entrance channel leading directly into the Forth will be different from any of those hitherto adopted in similar undertakings in this part of the country. On each side of the entrance a series of monoliths will be placed and sunk to a depth of from 40 to 50 feet. These monoliths, to be composed of concrete, will be rectangular in shape, of varying lengths up to about 40 feet, and about 20 feet in width. In constructing these monoliths a steel shoe with cutting edges is first placed on the surface, a piled platform having been previously erected to enable the process of sinking to be properly carried out. Two iron screw rods are then fastened to the shoe, and a brick kerb having been built inside the shoe a little above the level of the steel sides, the screws are brought into use for the purpose of lowering the steel shoe into the layer of mud forming the upper surface of the bed of the Forth. The operation is continued by removing the earth inside, and as the steel shoe gradually sinks, concrete walls are built, the concrete being poured in in a plastic state. This process goes on gradually, earth being removed from inside the monoliths, and concrete being added to the walls until the required depth has been attained. The screw rods in the meantime maintain the connection between the steel shoe and the brick kerb and concrete of which the monoliths are composed, and also prevent them from going off the line either laterally or vertically. The entrance to the channel at the sea end will be trumpet-mouthed, and the monoliths will extend for a considerable distance into the channel of the Forth. The same method will be followed in the construction of the inverts of the locks. But the remaining portions of the channels and the sides of the canting basin will be formed by a slope of 3 to 1. The quay walls will be composed either of concrete or rubble masonry, and the total quantity of concrete and rubble to be used, including the concrete in the monoliths, will amount to from 300,000 to 400,000 cubic yards. The material for the concrete will be procured from the slag heaps at Carron Ironworks. Similar slag was employed in the construction of the first dock formed by the Caledonian Company, and has proved thoroughly satisfactory. It is what is known as cold-blast slag; it was put out probably a century ago red hot, and, no doubt, was on fire afterwards for many years. After the dock walls are formed the interior excavation will be begun, the earthwork being removed partly by steam navvies and partly by dredging. The total quantity of earthwork to be thus disposed of, including that in connection with the sinking of the monoliths, will be from 3,000,000 to 4,000,000 cubic yards. The coping and ashlar for machinery beds, roller paths, ashlar pointing, square quoins, hollow quoins, sills, caisson sills, &c., will be of granite, of which material about 120,000 cubic feet will be employed. Altogether the dock will contain between 32 and 33 acres of water space, and will give at least treble the accommodation contained in the last dock. For the safety of the dock walls dry material will be placed and carefully rammed in the space behind the walls, and the whole of the earth to be excavated will be needed, it is expected, for raising the ground about the dock to the level of the coping of the dock walls. Around the reclaimed ground an embankment will be raised at the eastern end, thoroughly pitched and protected against the action of the sea. In extent this space will measure from the old dock to the sea about a mile and a half in length, while it will have a breadth of about half a mile. It will be utilised for railway sidings, hoists, shoots and the various appliances requisite for the working of the traffic of the port. The work of making the dock will be begun forthwith, and it is expected to be completed in about four years.

THE AUCTIONEERS' INSTITUTE.

THE autumn provincial meeting of the Auctioneers' Institute will be held at Brighton on Thursday and Friday, September 8 and 9. On the first day the council will be received by the mayor, Sir John Blaker, and will hold its business meeting in the Pavilion. The second day will be occupied in visiting the waterworks, the electricity generating station, the School of Technology, and other works connected with the Corporation. In the evening there will be a banquet in the Pavilion, when the president, Mr. Edward Dobson, of Bradford, will occupy the chair, and will be supported by the Mayor, members of the Corporation, local Members of Parliament and others.

CENTENARY OF GAS-LIGHTING IN BIRMINGHAM.

IT is interesting to record the fact, says the *Birmingham Post*, that this is the centenary anniversary of the time when William Murdoch first applied gas-lighting for illuminating purposes on an extensive scale in Birmingham. Murdoch was the inventor of gas-lighting, and thus became the founder of one of our most useful industries. He was a great public benefactor, how great can only be adequately appreciated by our oldest citizens, who can remember the days when tallow-chandlers abounded, the rushlight was the principal illuminant within the economic means of the working-classes, and gas was an expensive luxury. Those times have happily changed, and now gas is not only rapidly superseding oil and the wick in the humblest households, but more powerful illumination by electricity is gradually taking the place of gas in public buildings and prominent business establishments. What a difference has been effected in the lighting of Birmingham during the past hundred years. The manufacture of coal-gas in these days may be similar to that carried on by Murdoch, but the methods of producing it have been immeasurably improved. Man's ingenuity has given us superior buildings better appliances, improved machinery, and we enjoy the advantage of a more brilliant light at a cost of which our forefathers could not possibly have dreamed. Murdoch came to Birmingham in 1777, and accepted an engagement with Boulton & Watt, at Soho. Then he was sent by them to Cornwall, and it was while he resided at Redruth that he first applied coal-gas to economic purposes. This was in 1792, and in 1798, a century ago, when he returned to Soho and saw the flickering hand lamps which the workmen used, he carried out an installation of gas-lighting on a much larger scale than he had previously attempted. William Matthews, in his historical sketch of the origin and progress of gas-lighting, says that Murdoch's experiments at Boulton & Watt's works "were sedulously continued with a view to ascertain, not only the best modes of making, but also of purifying and burning the gas so as to prevent either the smell or the smoke from being offensive. The Peace of Amiens, which took place in the spring of 1802, afforded him an opportunity peculiarly favourable for making a more complete display of these brilliant lights than had ever been exhibited. The illumination of Soho works on this occasion was one of extraordinary splendour. The whole front of that extensive range of buildings was ornamented with a great variety of devices that admirably displayed many of the varied forms of which the gaslight was susceptible. This luminous spectacle was as novel as it was astonishing, and Birmingham poured forth its numerous population to gaze at and to admire this wonderful display of the combined effects of science and art." Murdoch had many difficulties to overcome before he attained the perfection which he exhibited on that occasion, but as he united scientific knowledge with great practical skill his perseverance enabled him to triumph. With the sanction of Boulton & Watt he extended the apparatus at the Soho foundry so as to give light to all the principal shops, and it was used by some of the leading tradespeople to the exclusion of other artificial light. Gas was not long, however, confined to this district. Its advantages were demonstrated in other towns, and eventually companies were formed to supply the public with this new and invaluable means of enhancing their domestic comfort. The first use of gas in London was in 1807, and the first gas company established was in the Metropolis in 1810.

Birmingham, strange to say, was very slow to move in the same direction, but private use was made of the invention by several persons. In 1817 Mr. John Gostling erected gasworks, and laid pipes for the supply of gas by agreement with the Street Commissioners and with private consumers. The first shop lighted was Pulteney's, at the corner of Moor Street, in 1818, but the streets were not lighted by gas until April 19, 1826. In 1819 Mr. Gostling's business was converted into a company, under the name of the Birmingham Gas Company, and in 1825 the Birmingham and Staffordshire Gas Company was established, the former supplying the town only, while the latter extended its area almost to Wolverhampton. These two companies remained in existence until 1875, when the undertakings were purchased by the Corporation on behalf of the town. Curiously enough there are no available records which would enable a comparison to be made of the amount of gas manufactured and distributed by the Corporation and by the old companies, but the prices charged are an eloquent testimony to the advantages we enjoy now as compared with the time of our forefathers. From 1819 to 1825 two methods of charging the consumers were adopted, namely, by contract and by meter indication. At first the number of consumers was small, and, according to their agreements, they were expected to turn out their lights within ten minutes of the time

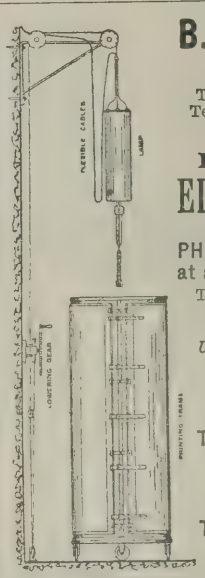
specified in the contracts, except on Saturday nights, when they were allowed an extra hour. Argand burners were used, and those who burned gas from dusk until nine o'clock at night were charged 3*l.* 10*s.* per annum if the burners had 16 holes, but if they only had twelve holes the price was 2*l.* 12*s.* per annum. If the gas was not extinguished until ten o'clock the prices were 4*l.* 10*s.* and 3*l.* 8*s.* respectively, eleven o'clock 5*l.* 10*s.* and 4*l.* 4*s.*, and twelve o'clock 6*l.* 10*s.* and 5*l.* This scale was in respect to six days a week, but if the seventh day was contracted for the prices were proportionately higher. When the meter system was solely adopted the consumption was the more easily checked, and the scale of charges was altered. In 1825 the price was 15*s.* per 1,000 cubic feet, less 5 per cent. discount for prompt payment, but it was subsequently reduced to 12*s.*, and in 1834 to 10*s.* per 1,000 feet. In 1837 a scale was introduced whereby the consumers of under 5,000 cubic feet of gas paid 9*s.* 2*d.* per 1,000, under 25,000 cubic feet 8*s.* 4*d.* per 1,000, under 75,000 cubic feet 7*s.* 6*d.* per 1,000, and above that quantity 6*s.* 8*d.* per 1,000, in each case a discount of 7½ per cent. being allowed. As years rolled by the scale was frequently revised, invariably in favour of the consumer. In 1850 the price varied between 5*s.* 6*d.* per 1,000 for a consumption under 10,000 cubic feet and 3*s.* 6*d.* per thousand for a consumption of 200,000 feet and upwards, the discounts being 5 per cent. In 1873 the price was 2*s.* 7*d.* per thousand for a consumption of 25,000 feet and under, and 2*s.* 3*d.* per thousand where the consumption reached 100,000 cubic feet. Then, in consequence of the prosperity of the times, higher wages and dearer coal, the price was slightly raised, and when in 1875 the Corporation acquired the undertakings the charges ranged from 3*s.* to 3*s.* 6*d.* per thousand feet, with a discount of 5 per cent. The next year the price was reduced 3*d.* per thousand feet, and other reductions were subsequently effected until 1887, when the scale ranged between 2*s.* 3*d.* and 2*s.* 7*d.* per thousand—prices which rule to-day. Although it is not possible to compare the development of the undertaking under the Corporation with the business done by the old companies, the growth of the gas department will be apparent by contrasting the first year under municipal government with that which expired in March last. In 1875 the amount of coal carbonised was 296,000 tons, but last year it had risen to 509,481 tons; and whereas the amount of gas sold and used in 1875 was, in round figures, 2,327,000,000 cubic feet, last year the total had reached the enormous amount of 5,074,000,000 cubic feet. The surplus profit in 1875 was 25,339*l.* and last year 50,336*l.*



LIABILITY FOR COST OF MAIN SEWERS.

JUDGMENT has been given by Lord Pearson of the Scottish Courts in an action taken by the Corporation to recover 337*l.* 7*s.* 5*d.* from Mr. David V. Wyllie, architect, Bath Street, Glasgow, as his proportion of the cost of a sewer constructed by the Corporation in 1895. The sewer was laid in Crow Road, which now forms the westmost boundary of Glasgow, the ground on the west side of the road being in Renfrewshire. The defender is proprietor of land adjoining Crow Road, which he acquired early in 1890. In 1890 the only drain was a 9-inch one. It served for some of the earlier plots, and still served for one of the streets, but it was obviously inadequate, his lordship said, for an extensive building estate. In 1891, when the area including Crow Road was annexed to Glasgow, the Corporation entered into an agreement with Partick and the Upper Ward of Renfrewshire for the formation of the Whiteinch Drainage District. The Glasgow Police Commissioners constructed the sewer, the total cost of which was a little over 11,000*l.* The Corporation founded their claim on their Police Act of 1866, and on the invariable practice in Glasgow as to defraying the cost of public sewers. The Act lays the first cost on the Corporation, but they are to be relieved of it (as to streets in which no ordinary public sewer previously existed) by the proprietors of lands and heritages adjoining the street in proportion to their frontage thereto. They had charged Mr. Wyllie according to this rule. He maintained that the Corporation were in error in appealing to their Police Act of 1866; that the sewer in question was not, and could not have been constructed or assessed for under that Act, even so far as it lay within the city, and that the Public Health Act, 1867, under which the Police Commissioners are the local authority, furnished the true standard of liability. It was urged that in the 1866 Act a public sewer was a sewer for carrying off the surface-water of a road or street, and that in so far as this one did more it was not a public sewer within the meaning of that statute, whatever else it might be. The Act was consistent with that view when it laid the burden on frontagers. But if a costly main sewer admittedly larger than was needed for street drainage in the limited sense ran down one street in a drainage area, the frontagers to that street might well complain if they had to pay the whole cost of it, and to pay it not even by instalments but all at once. It was also said that it was impossible to ascertain how much of the cost the Corporation would have to bear until the lapse of 33⅓ years. The Corporation had power to construct this sewer from end

to end under the Public Health Act, 1867, in which case the cost would have been defrayed by a general assessment spread over a series of years. His lordship said he had found the case presented attended with difficulty, but on the whole he was not satisfied that what the Corporation proposed to do in the way of charging for the Glasgow part of the sewer was not beyond their power. It was true that the Glasgow part of the sewer would not in itself have been available for want of an outfall, and that the Glasgow Police Act, 1866, afforded no solution of the difficulty. It might also be true that the difficulty might have been overcome under the Public Health Act, 1867, which would have resulted in an annual charge on the general assessment. But the thing having been done under an agreement confirmed by statute, and Glasgow being simply left to apply her own rules as to assessment, his lordship thought the Corporation were warranted in treating the sewer so far as within the city as if it were a new public sewer. All along since 1862 the cost of sewers such as this had been borne by the frontagers. Although it might not be the fairest method of providing for the cost of main or trunk sewers, it was the Glasgow method, and this his lordship thought was the true answer to the defendant's complaint, that the frontagers in Crow Road were suffering exceptional hardship. The defendant also pleaded that the burden on frontagers only applied to the case of a road or street in which no ordinary public sewer previously existed, and that such a sewer did previously exist in Crow Road, namely, the 9-inch drain above referred to. His lordship thought this plea failed upon the facts, and he was not convinced that that drain ever ceased to be a private drain. It must be remembered that until 1891 this drain was not in the city, and the Glasgow Police Act had no application to it. But it was said that at the moment of annexation in 1891 the definition clause of the Act of 1866 attached to it, and made it a public sewer. This seemed not quite consistent with section 52 of the Annexation Act of 1891, by which private drainage works could only be acquired by the Corporation after certain procedure, including the payment of compensation. His lordship next dealt with an argument stated for the defendant, to the effect that the Corporation had so dealt with the drain as to commit them to the view that it was a public sewer, and said he could not hold that the Corporation were barred from contending that the drain was not a public sewer. With regard to the pleas stated against the principle on which the allocation had been made, his lordship said the defendant carried his contention this length, that each frontager should be dealt with in the calculation quite apart from the others; and that one whose property happened to be situated where the sewer was near the surface, or where there was no rock cutting or no manhole, was to get the benefit of that in the calculation. His lordship thought the method followed by the Corporation was in every way more reasonable and equitable, and on the whole matter he thought the Corporation were entitled to prevail. They were willing to take the frontage at 232 yards instead of 240, which brought down the sum claimed to 337*l.* 7*s.* 5*d.*, and as this was only conceded at the proof, he thought interest should only run from that date as on an ascertained amount.

PATENT AND MERCHANDISE MARKS.

A PARLIAMENTARY paper was issued on Saturday containing correspondence and reports relating to the recent International Conference at Brussels on the subject of industrial property and merchandise marks. The British delegates, in concluding their account of the proceedings, observe :—"We may state that, if the positive results of the conference are not great, the thorough discussion to which the disputed points have been subjected may possibly clear the ground for the establishment of a general accord. It is evident that the German Government will not join the union unless satisfaction is given to them on two points, viz. (1) Agreement to three years as the minimum period for the forfeiture of patents for non-working; and (2) the extension of the period of priority for patents from six to twelve months. Great Britain could grant the former of these concessions without any fresh legislation. Not so, however, as regards the latter. It will be for Her Majesty's Government to consider whether, if an agreement can be reached between Great Britain and France and the other contracting States as to Article VI., relative to the registration of a trade mark *telle quelle*, it is desirable or not to undertake the legislation which would be required to give effect to an extension of the period of priority for patents from six to twelve months. If this could be done every obstacle, so far as Great Britain is concerned, would apparently be removed to the adhesion of Germany to the union."

CHRIST CHURCH, BIRMINGHAM.

was to determine the value of the property, right and interest of Miss Elizabeth Homer in and to certain catacombs and vaults under Christ Church, and the compensation to be paid to her for the acquisition thereof. Mr. Frank Smith, of Cannon Street, was the arbitrator on behalf of the claimant, Miss Homer (instructed by Messrs. Jacob Rowlands & Son), and Mr. Edward Bettridge, Waterloo Street, was the arbitrator on behalf of the church trustees (instructed by Messrs. Milward & Co.), and they appointed Mr. George Spencer Mathews, Waterloo Street, to act as umpire. The arbitration proceedings took place in June last, and Mr. Smith and Mr. Bettridge having failed to agree the matter was referred to the umpire. Mr. Mathews has recently published his award, and the amount works out a little more than 10*l.* a catacomb. The catacombs are built in tiers of three, and each catacomb averages 7 feet 9 inches long, 2 feet 9 inches wide and 1 foot 8 inches high, and contains approximately 19 superficial feet.

TRINITY HOSPITAL, LEICESTER.

THE construction of a new bridge over the canal and the making of a new road from the Western Boulevard into the Newarke at Leicester, necessitated an interference with the ancient buildings of the Trinity Hospital. Not only had the Corporation to take a portion of the front garden for the purpose of widening the thoroughfare, but to straighten the street line some of the rooms in the institution had to be taken down, the Town Council making an exchange of land by way of compensation. The alterations had raised the question of increasing the accommodation at the hospital, where the inmates had now no day room, but must live and sleep in the same apartment. Two schemes are at present under consideration, with the object of giving the hospitallers two rooms each, and one of them will ultimately be adopted. The hospital, with an oratory, was founded in 1330 by the Duke of Lancaster, and enlarged by his son, then benefiting about 100 alms people, who were attended by some ten nurses, and the oratory having been transformed into a collegiate body. Eventually the college was disbanded, but the hospital continued, and in 1770 was renovated at the expense of the Duchy of Lancaster. It is one of the most ancient places in the borough, the chapel of the hospital being the same as was used in the days of John o' Gaunt. This it is proposed to leave untouched.

SWIVEL WINDOWS.

A BUILDING ordinance was recently passed by the City Council of Chicago compelling the use of swivel windows above the second storey of all new buildings. The purpose of the law is declared to be the prevention of the numerous accidents attending the cleaning of stationary windows. The new law provides that upper storey windows must swing on horizontal or vertical pivots, otherwise a balcony must be built in front of every window. Opposition has arisen to the law on the ground that it was designed to benefit the owners of patents on swivel windows, and also that the size of windows will have to be reduced owing to wind pressure, and accidents will result from falling window-sashes.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

17614. Edward Lloyd Pease, for "Improvements in structural arrangements in a manner applicable to roofing and the like structural purposes."

17663. Andrew Kesson, for "Improvements in brick-making machinery."

17696. John Cameron Swan, for "Improvements in kilns for burning cement-making materials and for similar purposes."

17792. James Carr, for "Improvements in ventilators for ventilating rooms, buildings and the like."

17863. John L. Stevenson and John Evans, for "Checkering bricks for hot-blast stoves."

17933. Thomas Constantine Fawcett, for "Improvements in the method of feeding duplex brick-making machines."

17951. George Hodgkinson, for "Improved means for glazing roofs and similar parts of buildings or structures."

19273. Quoclin, for "System of sheet roofing."

CATHEDRAL SERIES, No. 164.—PETERBOROUGH: WEST FRONT. PLAN AND SECTION.

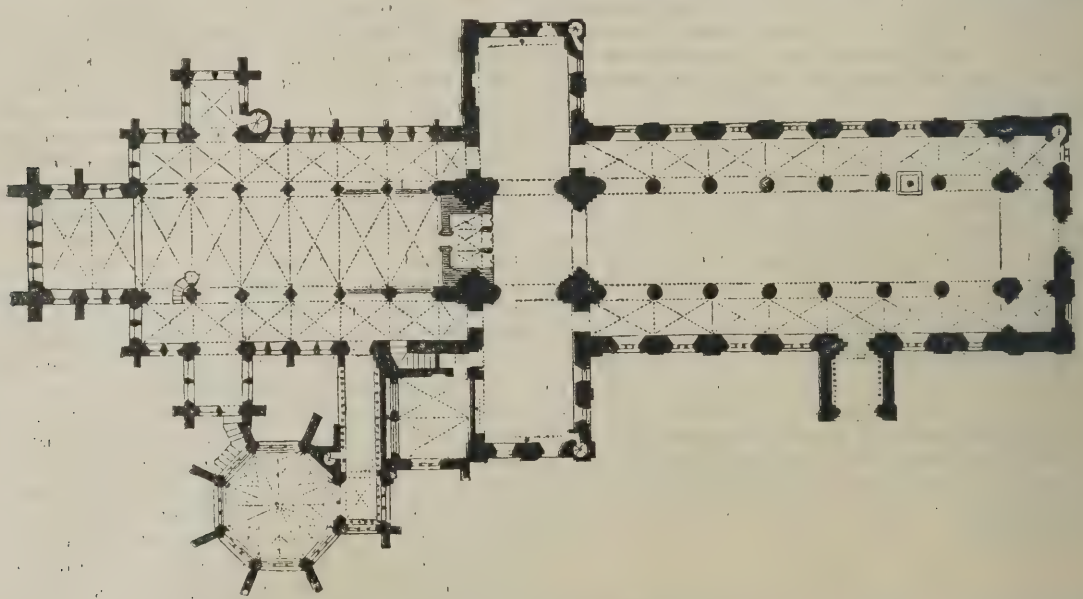
The Architect.

THE WEEK.

IT was right on the part of Sir J. WOLFE BARRY to draw attention at Bristol to the unnecessary cost which is imposed on those who have to erect large structures in order to meet the requirements of the Board of Trade in providing for wind pressure. TREDGOLD ascertained that the pressure was equal to 40 lbs. per square foot, and was similar with areas of all dimensions. But when at Christmas, 1879, the Tay Bridge broke down, owing, as was supposed, to wind pressure being more than 40 lbs. a foot on the exposed surface, the Board of Trade enacted that all railway bridges and similar structures should be made able to resist a pressure of 56 lbs. There was a belief that small gauge experiments were not to be relied on. It was found by experiments at the Forth Bridge on two wind gauges, one of 300 square feet and the other of 1½ square feet, that with an increase of area the unit of pressure fell off in a very marked degree. Under the same conditions of wind and exposure the larger gauge registered a pressure 38·7 per cent. less per square foot than the smaller gauge. Sir J. WOLFE BARRY instituted experiments at the Tower Bridge by observing the pressure on the surface of the bascules of the bridge as evidenced by the power exerted by the actuating engines. In that way a wind gauge of some 5,000 feet in area was obtained, and it has been shown that, while small anemometers placed on the fixed parts of the bridge adjoining the bascules register from 6 to 9 lbs. per square foot, the wind pressure on the bascules is only from 1 to 1½ lbs. per square foot. The amount fixed by TREDGOLD was therefore more than sufficient. "It is difficult to imagine," said Sir J. WOLFE BARRY, "the amount of money which has been wasted in unnecessary provision against wind strains of 56 lbs. per square foot on large areas in consequence of this hurried generalisation from insufficient data. I know something of what the provision for 56 lbs. on the square foot for wind cost at the Tower Bridge, and I do not wish to mention it; but if the public had been told that the dictum of experts, arrived at however hastily in 1880, was to be set aside in the construction of that bridge, all confidence would have been beforehand destroyed in it, and I suppose no committee of Parliament would have passed the Act." It is well occasionally to make assurance doubly sure, but in construction excessive strength imposes other charges besides those of cost.

ON Monday the Cheltenham Town Council passed the following resolution:—"That whereas the present distribution of the fund available for technical instruction in Cheltenham secures inadequate results for the money spent, this Council is of opinion that the time has arrived when steps should be taken to establish a school of technical instruction under the control of the Corporation of Cheltenham, and hereby requests the technical education committee to forthwith consider and prepare a scheme for the establishment of such school." In many other corporations a similar resolution would be adopted if as much care were taken in the investigation of results. The "education" which is given in most of the provincial towns can hardly be taken seriously. But it serves the purposes of a host of officials at South Kensington, and to uphold them at all costs is, we suppose, one of the inevitable misfortunes to which the country is doomed.

IT is expected in modern warfare that public buildings will not suffer by cannonading if they can be avoided, and the French console themselves for some of their losses in the war of 1870-71 by charging their opponents with indifference to a regulation which was dictated by advanced civilisation. The great victory of Friday last in the Soudan —one in which all Britons can rejoice—has caused more or less injury to the Mahdi's tomb, but it is not apparently an example of architecture which does much credit to the modern Arab artists. It was apparently designed by an ex-Government official, and those in Egypt are not of more refined taste than the officials of the West. According to SLATIN PASHA it is "a square building, was erected some 30 feet high and 36 feet each way, and the stone for this construction, of which the walls were upwards of 6 feet thick, had to be brought all the way from Khartoum. About this a hexagonal wall 15 feet high was built, from which rose a dome 40 feet high. On the corners of the main building were four smaller domes. This was called Kubbet el Mahdi (Mahdi's dome). It was furnished with ten large arched windows and two doors, and in the hexagonal portion were six skylights. It was whitewashed all over and surrounded by a trellis-work fence. The windows and doors were made by the workmen in the Khartoum arsenal, while directly beneath the dome and over the Mahdi's grave a wooden sarcophagus was erected, covered with black cloth. On the sides of the walls candelabra were hung, while suspended by a long chain from the centre of the dome was an immense chandelier taken from the Government Palace at Khartoum. The sombre appearance of the inside of the building was relieved by some gaudy painting on the walls." Probably it was supposed the tomb of the Mahdi would rival MOHAMMED'S as a goal of pilgrims, but after the downfall of the Khalifa a week ago the tomb had better vanish like other "dangerous structures."



WHEN describing GIOTTO'S frescoes at Sta Croce, and especially that which represents the contest between St. FRANCIS and his father, Mr. RUSKIN says, "I have read the picture to you as, if Mr. SPURGEON knew anything about art, Mr. SPURGEON would read it—that is to say, from the plain, common sense, Protestant side." The volume of the Pastor's autobiography which has just appeared reveals that, in spite of his indifference to art, Mr. SPURGEON'S common-sense Protestantism at one time fascinated Mr. RUSKIN. He was a regular attendant at the services in the concert-hall of the Surrey Gardens. The catastrophe of 1856 was not without its effect on the minister, and in 1858 he was dangerously ill. On the very first day Mr. SPURGEON was able to leave his room he was visited by Mr. RUSKIN, who exclaimed on seeing him, "My brother, my dear brother," and, casting himself on his knees beside the sofa, kissed him tenderly. But he did not come empty-handed. It was characteristic of Mr. RUSKIN that as the most efficient aids to recovery he brought with him a pair of engravings and some bottles of rare wine. Mr. SPURGEON regained his strength and throughout his life remembered the writer's impulsive tenderness. But common-sense Protestantism, like many other common-sense theories, lost its interest for Mr. RUSKIN, and indeed a clergyman who was indifferent to art had little chance of prevailing with him. He acknowledged that he would have accepted the teaching of the Catholics if their clergy had shown more respect for masterpieces of painting. But questions of doctrine could not overcome Mr. RUSKIN'S good nature, and he would be as moved by the sight of a sick monk as he was by that of the Surrey pastor.

THERE does not appear to be much progress made in the arrangements for the new Salle des Séances in the French Chambre des Députés. A committee of eleven members has been formed and an architect appointed, but the plans have not yet obtained approval. It was necessary to study foreign legislative buildings, and to undertake a series of soundings. Preliminary inquiries always are tedious, and it is not anticipated the works can be commenced before next year. It will be remembered that the new salle is to be erected in the Cour de Bourgogne, the existing salle being converted into a conference hall. The galleries, to which the public are now admitted, will not be required for that purpose hereafter, for the deputies would not gain by deliberating before the crowd, so it is intended to use them as an annexe to the libraries. Works which are rarely consulted can be placed there. The new salle will be adorned by the foremost painters of Paris, but it is premature to consider decoration when the ground remains unexcavated for the foundations.

SOUTHWELL CATHEDRAL.

IT will take some time before Southwell Cathedral is as familiar a title as Southwell Minster. We may also add that the view of restored building, and especially the spires with which the western towers are now crowned, and the low roof, will appear less attractive than vanished view. Old associations count for much in judging an English church, and Southwell Minster in its former condition was accepted as one of the most interesting examples of architecture in England. Any changes which have taken place were required in order to adapt the building to cathedral purposes and to increase its durability, but none the less the works which were carried out altered the character of a building that by many people was accepted as approaching the ideal of its class.

Southwell was a collegiate church, and its privileges as such appear to have existed at least from the ninth century. They may have had an earlier origin. Tradition assumes that a church was founded on the site by St. Paulinus, which was collegiate as well as parochial. The Roman missionary appears to have traversed the district in which Southwell stands, and might therefore select a site which then, as now, possessed many advantages. But the creation of a collegiate establishment was hardly feasible in a new district in the seventh century. That would mean the possession of capital in some form, most likely landed property, while the early missionaries appear to have lived from hand to mouth among their flocks. At the

time of the Reformation the representatives of the church claimed that the foundation dated from the reign of "the Righte famous of memorye Edgare the Kinge ma^{ties} moste noble p'genitor." Edgar came to the throne in 959, and the collegiate foundation at Southwell probably was not of older date.

But the institution existed before Christianity. In ancient Rome a collegium, or corpus, was a legalised association consisting at least of three members. It was necessary to obtain the sanction of the senate or of the emperor. Each association could possess property and receive legacies or gifts. The worshipful companies of London retain many of the characteristics of the old Roman collegia. But some were for religious purposes, and it has been assumed by German archæologists that the Christians in Rome were allowed to take advantage of the conditions in order to have meetings for divine service. The Roman origin was suggested when the canonists insisted on having at least three canons attached to every collegiate church. Southwell could therefore start when a provision for that number of clergy was secured. But if so, there was soon an increase. At the Conquest Southwell possessed ten prebends, and at the end of the thirteenth century there were sixteen. A collegiate church was an auxiliary to a cathedral, and having several able men must often have been a centre where counsel was to be obtained without the necessity of a long and toilsome journey to the cathedral. It is known that on one occasion the Archbishop of York announced that the duty of the annual visitation could be performed by the people of Nottinghamshire through a visit to Southwell equally well as by a visit to York. A concession of that kind is evidence of the importance which was recognised as belonging to the collegiate church. The prebendaries were invested with episcopal privileges, and they were even authorised to excommunicate all those who injured them or their property. They were likewise exempted from many of the onerous duties which devolved upon the possessors of landed property by English law. What is more remarkable, the hardships of the forest laws did not afflict them, for they were allowed to have the woods of their prebends in their own hands and custody, and the king's foresters were forbidden to take or sell anything found under the trees.

There appears to be no peculiar cause for the power of the canons of Southwell Church. The building was not the scene of any remarkable event. It did not possess extraordinary relics. Princes or great nobles were not numbered among its clergy. Yet there can be no doubt the collegiate body was wealthy and influential. Let us suppose the members were careful in attending to their duties and were sympathetic with all the sorrows which were found in the district, or in other words, that canonries were bestowed only on such men as by repute were model priests.

The church by itself is the best memorial of the power of the clergy. It is manifestly a costly building, and no one can doubt that it was adapted to become a nineteenth-century cathedral. The laity of the district must have provided the funds required for its construction. Apparently the greater part was erected in the early years of the twelfth century, and it is believed the work was carried out during the episcopate of Thomas II., Archbishop of York, 1109-14. Some parts of earlier buildings have been exhumed from time to time. There seems to be little doubt that in the building which preceded the existing structure the aisles, if not the nave, terminated with semicircular apses, and the flooring of the apses was much below the level of the aisles. The choir of the nave, on the contrary, must have had a floor on a higher level. At Southwell we have advanced Norman, and the style has little of that heaviness if not clumsiness which made Gothic so welcome an innovation.

The question of floor levels was one which received much attention when the restoration of the building was undertaken. The late Mr. Ewan Christian, who was entrusted with the work by the Ecclesiastical Commissioners, considered it was difficult to decide what was the original level, although he had no doubt the present floor had remained in *statu quo*, the pavement being very ancient. It was, he said, generally supposed that the floors of old churches had sunk below the level of the churchyards simply because the latter had risen. No doubt that was so to a certain extent, but it was impossible for churchyards to have risen to such an extent as he had seen in some places. In old times the floors of churches

often were laid below the level of the adjacent ground, and he believed the church at Southwell was an example. No doubt a great deal of mischief had been done in modern churches by lifting up the floors. There were many churches in the country the floors of which rose or fell according to the level of the ground, notably in St. David's Cathedral, which was built into a hill, and where there was a strong slope from one end of the church to the other of 3 feet 6 inches. In Southwell, as in many other cases, the bases of the pillars showed that they had been built upon a slope to suit the level of the ground.

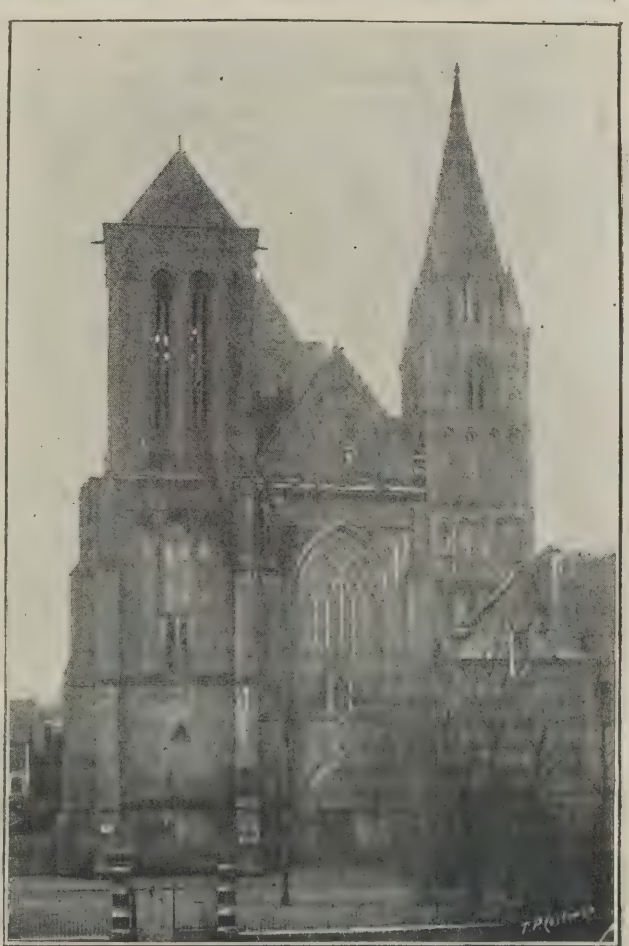
The choir is Early English, and is believed to have been erected during the time when WALTER GREY ruled the See of York. Apparently the funds possessed by the canons were not able to meet the expenses, and it was necessary for the archbishop to appeal to the whole diocese for aid. The canons, it must be said, arranged to contribute one-fifteenth of their incomes towards the work. The choir would, therefore, appear to be erected between 1230 and 1250. There is a deed dated 1241 relating to a chantry which is said to be in the new work "in novo opere," and the words are taken to mean the choir. In the thirteenth century there was enthusiasm for building from which Southwell could not escape. Although there appeared to be some difficulty in finding money for the choir, that work was scarcely concluded when the *custos* arranged for the undertaking of other parts. A general resolution was therefore come to which stipulated that the *custos* was not to commence any new work in the church or outside without the consent of a convocation of the other canons. As it is believed from the character of the work that the north transept chapel, the cloister and the chapter-house and vestibule all belong to the thirteenth century, we cannot believe that the convocations of Southwell were opposed to new works, although it might be considered desirable to exercise control over the *custos*. According to Mr. PARKER the choir and chapter-house of Southwell "contain some of the richest and most beautiful details of Early English and Early Decorated work that we have remaining."

The rood-screen was constructed in the fourteenth century, and windows were inserted in the nave aisles. The west window is supposed to date from A.D. 1430, and BOOTH'S Chapel (which was taken down in 1847) from 1440.

SAINT PIERRE SUR DIVES.

By JOHN A. RANDOLPH.

IT is worth the tedium of the journey *viâ* Havre, the direct route, to visit this rather out of the way place.



Lisieux is well known to architects who have "done" their Normandy, but those who have failed to see the church of St. Pierre sur Dives have failed to make themselves acquainted with what is in all probability the largest

—and certainly the finest—village church of the whole of France.

It is now the village church, but formerly belonged to the abbey, part of whose buildings, simple and of solid construction, still remain, but adapted as modern habitations for a not wealthy set of the villagers. This part abuts on and partly masks the lower half of the south-west tower, and faces a very narrow and atrociously paved thoroughfare of about 60 yards, or perhaps 70 long, leading into a small open space in front of the great church, possessing a few

healthy trees. The south-west tower, as it clears the roof of the abbey remains, shows three storeys of Romanesque

style with shallow arcading, two in fives and one in four. Above this is a stage of thirteenth-century date, having a small twin-light belfry window under a deeply recessed shafted arch, and two ornamented round panels on each side. A set of small brackets supports the cornice, and the whole is surmounted by a stone spire with stone corner spirelets. The west gable, which is minus its cross, was crocketed, but those ornaments on one side are nearly all gone. There is a beautiful bit of blind tracery, not unlike a window in Lincoln Cathedral, over a deep and ornate string-course over the Flamboyant west window. At the base of this window is a Late Gothic niche, with the MADONNA placed on the great sill of the window. The west doorway is thirteenth century, ornate and shallow. The north-west tower is very plain in its lowest stage, but the storey above has three sets of cusped lancets, the two outside ones being under large three-cusped heads, and the centre one under three small-cusped circles, the whole forming blind tracery and under a straight head. The top stage of this tower is a replica of the north-west tower of St. Pierre at Lisieux. At the junction of the nave, choir and transepts rises a magnificent square tower of two storeys, with shallow buttresses to the tower stage only, and the upper stage ornamentation being almost identical with that of the north-west tower, only not so high. It is surmounted by an equilateral roof.

The choir is apsidal and of three bays, with Late Gothic tracery in the upper windows. The chancel arch is pointed, but that from the nave to the transepts is a richly-moulded round arch. The nave vault is cross-ribbed, with the key-stones carved and the cross-ribs painted ornamentally for about a clear yard. The clerestory has traceried windows, but the nave arches and triforium are of an early date in the thirteenth century. The aisles are narrow and simple. The church sadly needs repair.

The fittings and the tone of the organ are positively distracting, as also the singing, especially after that of St. Pierre at Lisieux.

The "Halles," at a short distance east of the church, has probably the largest timber roof in the world, but the building is low and very plain.

THE BRITISH ASSOCIATION.

ON Wednesday the British Association for the Advancement of Science met for the third time in its history in Bristol. The former meetings were in 1836 and 1875. The address which was delivered by Sir William Crookes, the president, on Wednesday, was mainly occupied with the important question of the supply of bread to the inhabitants of these islands. It was a scientific upholding of the theory of Malthus, which was derived from Hume and Price, that population increases in a different ratio to the means of subsistence. Sir William Crookes admitted that his statements were of the alarmist order and were certainly depressing, but they were founded on stubborn facts. They were intended to show that England and all civilised nations stand in deadly peril of not having enough to eat. The wheat-producing soil is totally unequal to the strain put upon it. The way out of the colossal dilemma would be shown when the chemist came to the rescue of the threatened communities. It was through the laboratory that starvation might ultimately be turned into plenty. In connection with this subject the President drew attention to the startling fact that in the United Kingdom we are content to hurry down our drains and water-courses, into the sea, fixed nitrogen to the value of no less than 16,000,000*l.* per annum. This unspeakable waste continues, and no effective and universal method is yet contrived of converting sewage into corn. Of this barbaric waste of manurial constituents Liebig, nearly half a century ago, wrote in these prophetic words:—"Nothing will more certainly consummate the ruin of England than a scarcity of fertilisers—it means a scarcity of food. It is impossible that such a sinful violation of the divine laws of nature should for ever remain unpunished; and the time will probably come for England sooner than for any other country when, with all her wealth in gold, iron and coal, she will be unable to buy one-thousandth part of the food which she has, during hundreds of years, thrown recklessly away."

In conclusion the President said:—

These, then, are some of the subjects, weighty and far-reaching, on which my own attention has been chiefly concentrated. Upon one other interest I have not yet touched—to me the weightiest and the farthest reaching of all.

No incident in my scientific career is more widely known than the part I took many years ago in certain psychic researches. Thirty years have passed since I published an account of experiments tending to show that outside our scientific knowledge there exists a force exercised by intelligence differing from the ordinary intelligence common to mortals. This fact in my life is of course well understood by those who honoured me with the invitation to become your President. Perhaps among my audience some may feel curious as to whether I shall speak out or be silent. I elect to speak, although briefly. To enter at length on a still debatable subject would be unduly to insist on a topic which—as Wallace, Lodge and Barrett have already shown—though not unfitted for discussion at these meetings, does not yet enlist the interest of the majority of my scientific brethren. To ignore the subject would be an act of cowardice—an act of cowardice I feel no temptation to commit.

To stop short in any research that bids fair to widen the gates of knowledge, to recoil from fear of difficulty or adverse criticism, is to bring reproach on science. There is nothing for the investigator to do but to go straight on, "to explore up and down, inch by inch, with the taper his reason;" to follow the light wherever it may lead, even should it at times resemble a will-o'-the-wisp. I have nothing to retract. I adhere to my already published statements. Indeed, I might add much thereto.

Confirmation of telepathic phenomena is afforded by many converging experiments, and by many spontaneous occurrences only thus intelligible. The most varied proof, perhaps, is drawn from analysis of the sub-conscious workings of the mind, when these, whether by accident or design, are brought into conscious survey. Evidence of a region below the threshold of consciousness has been presented since its first inception in the "Proceedings of the Society for Psychical Research," and its various aspects are being interpreted and welded into a comprehensive whole by the pertinacious genius of F. W. H. Myers. Concurrently, our knowledge of the facts in this obscure region has received valuable additions at the hands of labourers in other countries. To mention a few names out of many, the observations of Richet, Pierre Janet and Binet (in France), of Breuer and Freud (in Austria), of William James (in America), have strikingly illustrated the extent to which patient experimentation can probe subliminal processes, and can thus learn the lessons of alternating personalities and abnormal states. Whilst it is clear that our knowledge of subconscious mentation is still to be developed, we must beware of rashly assuming that all variations from the normal waking condition are necessarily morbid. The human race has reached no fixed or changeless ideal; in every direction there is evolution as well as disintegration. It would be hard to find instances of more rapid progress, moral and physical, than in certain important cases of cure by suggestion—again to cite a few names out of many—by Liébeault, Bernheim, the late Auguste Voisin, Bérillon, (in France), Schrenck-Notzing (in Germany), Forel (in Switzerland), Van Eeden (in Holland), Wetterstrand (in Sweden), Milne-Bramwell and Lloyd Tuckey (in England). This is not the place for details, but the *vis medicatrix* thus evoked, as it were, from the depths of the organism is of good omen for the upward evolution of mankind.

A formidable range of phenomena must be scientifically sifted before we effectually grasp a faculty so strange, so bewildering and for ages so inscrutable as the direct action of mind on mind. This delicate task needs a rigorous employment of the method of exclusion—a constant setting aside of irrelevant phenomena that could be explained by known causes, including those far too familiar causes, conscious and unconscious fraud. The inquiry unites the difficulties inherent in all experimentation connected with mind, with tangled human temperaments and with observations dependent less on automatic record than on personal testimony. But difficulties are things to be overcome even in the elusory branch of research known as experimental psychology. It has been characteristic of the leaders among the group of inquirers constituting the Society of Psychical Research to combine critical and negative work with work leading to positive discovery. To the penetration and scrupulous fairmindedness of Professor Henry Sidgwick and of the late Edmund Gurney is largely due the establishment of canons of evidence in psychical research, which strengthen while they narrow the path of subsequent explorers. To the detective genius of Dr. Richard Hodgson we owe a convincing demonstration of the narrow limits of human continuous observation.

It has been said that "nothing worth the proving can be proved nor yet disproved." True though this may have been in the past, it is true no longer. The science of our century has forged weapons of observation and analysis by which the veriest tyro may profit. Science has trained and fashioned the average mind into habits of exactitude and disciplined perception, and in so doing has fortified itself for tasks higher, wider and incomparably more wonderful than even the wisest among our ancestors imagined. Like the souls in Plato's myth that follow the chariot of Zeus, it has ascended to a point of

vision far above the earth. It is henceforth open to science to transcend all we now think we know of matter, and to gain new glimpses of a profounder scheme of cosmic law.

An eminent predecessor in this chair declared that "by an intellectual necessity he crossed the boundary of experimental evidence and discerned in that matter, which we in our ignorance of its latent powers, and notwithstanding our professed reverence for its Creator, have hitherto covered with opprobrium, the potency and promise of all terrestrial life." I should prefer to reverse the apophthegm and to say that in life I see the promise and potency of all forms of matter.

In old Egyptian days a well-known inscription was carved over the portal of the temple of Isis:—"I am whatever hath been, is, or ever will be; and my veil no man hath yet lifted." Not thus do modern seekers after truth confront nature—the word that stands for the baffling mysteries of the universe. Steadily, unflinchingly, we strive to pierce the inmost heart of nature, from what she is to reconstruct what she has been, and to prophesy what she yet shall be. Veil after veil we have lifted, and her face grows more beautiful, august and wonderful with every barrier that is withdrawn.

ITALIAN, FRENCH AND GERMAN BINDINGS.*

THE chief difference between the books of the latter half of the fifteenth century and those that preceded them is that caused by the introduction of printing, and although to some extent the tradition of rich jewelled and enamelled bindings was carried on in England in the form of books bound in velvet and adorned richly with small pearls, enamels and rare jewels, generally speaking the bindings became far simpler. But, as has been shown, these simple bindings in leather paved the way for the developments of the beautiful art of gold tooling, which, used in an elementary and accessory way by the Orientals, in the hands of their Italian copyists reached a high point of art and technique. It is generally considered that the gold tooling on early Italian books was first done on those issued from the press of Aldus Manutius, but there seems little doubt that the art was known and practised by Italian binders before him. Indeed it is difficult to say positively whether Aldus bound any of his books himself. On one of those attributed to him occurs, in blind, the device of a dolphin, and on many what is known as the Arabic knot. This knot, copied directly from Oriental work, is sometimes impressed in blind and sometimes in gold. The early Venetian and Florentine bindings are remarkable for the consummate skill and taste with which the few tools used upon them are designed. They have, I think, never been surpassed in these qualities, although later work is technically of greater excellence. Many of the borders found on early Italian bindings are repeated and modified again and again, both in English and French work.

So much cannot be said for the Italian bindings made with sunk panels, also after an Oriental pattern. In these instances the Italian love of colour has resulted in work that is very brilliant, but often over-coloured. The boards are not of wood, but pasteboard, and the sunk panels are often made by means of double boards, the upper of which is pierced. The edges of the double boards often show a depression along their centres where the two boards join, and curiously enough this depression is often artificially produced in later Italian, French and English work as a decorative feature in itself. The ornamentation upon these books is frequently finished by hand painting in gold and colours, and on such of them as contain official documents the lion of St. Mark is often shown in the centre oval. The art of the Venetian binders, however, is considered to have reached its highest point in the bindings made for Jean Grolier, Vicomte d'Aguisy, who spent some time in Italy as ambassador from Francis I. to Pope Clement VII., and was afterwards Treasurer-General of France. He was a scholar and a man of taste, and is well known as being not only the first great collector of books, but also the first amateur to have his books bound for himself in a particular manner. The designer of his bindings is unknown. It has been suggested that Geoffrey Tory may have had something to do with them, and it has also been thought that Grolier himself gave the general idea of the decoration. The earlier "Groliers" were no doubt bound in Italy, and on them the small fleurons and tools are cut solid. At a later time the tools were cut with lines across them; these are usually considered to be French work, but it is difficult to decide, as it is likely that Grolier took an Italian finisher with him on his return to France. The backs of Grolier's books are sometimes ornamentally treated. On one board, at the lower part, is the legend "Io. Grolierii et amicorvm," and on the other board are usually the words "Portio mea domine sit in terra viventium" stamped in the centre. Many of the brown morocco bindings are marbled with a dark stain, and at the beginning and end of each volume is a section of vellum, making the joint very strong, and sometimes stiff to open. The fillets on some of Grolier's bindings are stained black, but with this exception no colour besides the gold is used on any of his Italian bindings, although red and blue occur on some French examples.

Tommaso Maioli, another great collector, used a similar inscription to that of Jean Grolier, and put on most of his books the words "Tho. Maioli et amicorvm," and on some of his books inlays of coloured leather are found; one, a copy of the "Hypnerotomachia Poliphili," printed in Venice in 1499, but bound later, is in dark blue morocco with the centre panel of the upper board inlaid with citron morocco. Several of the simpler bindings made for Maioli have the grain of the morocco slightly filled in with gold, and the leathers are sometimes marbled with a dark stain. Many of his bindings are picked out with background thickly powdered with small gold dots.

The early Italian bindings are sometimes ornamented with "cameo" impressions on the leather. These impressions are themselves often made in a hollow cut or dressed into the side of the board. One of the most tasteful instances of the use of this kind of ornament occurs on the red morocco binding of a Greek "Anthology," printed at Florence in 1490. On one side, in a circular hollow, is a cameo portrait of Alexander the Great, and on the other Philip of Macedon—the gold and blind tooling in this book is most charming. Other instances of portraits made in a similar way are found, but the best known are the stamps found on books which belonged to Demetrio Canevari, physician to Pope Urban VII. These stamps vary in size according to the shape and size of the books on which they are used—the bindings were probably made in Venice between 1534 and 1560—the rest of the gold tooling is distinctly of Venetian character, but they were not made for Canevari himself, who was not born until 1559.

The design on the "Canevari" stamps represents Apollo driving a golden chariot, with a white and a black horse, towards a hill on which is a silver Pegasus, the colour being added by hand. Apollo has a golden helmet and a golden cloak, and holds a golden whip in his hand. On the larger stamps some silver clouds are shown in the sky, but these do not occur on the smaller stamps. Round the stamps on a ribbon are the words "ORTHOS KAI ME LOXOS," and gold tooled work of fine design usually encloses the whole, with sometimes the title of the book in an ornamental cartouche. The colouring on the cameo is frequently very faint, but some of it can generally be found in protected corners. Traces of all the original colour can be still seen in the splendid copy of "Polydorus Vergilius de Historia Anglica," now exhibited in one of the binding show-cases in the King's Library at the British Museum.

The later Italian bindings are largely heraldic. From the interesting sixteenth-century embroidered book with the arms of Cardinal Perretti, afterwards Pope Sixtus V., to those made for Henry Benedict, Cardinal York, there are numerous examples. The papal bindings are, some of them, decorative enough, with the tiara and cross keys, the arms in each case being those of the family of the Pope. But generally the art of decorative bindings in Italy, from the sixteenth century onwards, suffered a rapid and remarkable fall, which it has never recovered. The Italian work not heraldic of this period is frittered away in minute stamps, inferior in design and weak in combination. A little inlay of coloured leather is sometimes found, and also there are instances of stained and painted leathers.

2. *France.*

In France the art of bookbinding has been highly appreciated for a long time, and many beautifully illustrated books treat of the subject.

Heraldry plays an important part in the history of French bookbinding, and for this division of book decoration a most valuable text-book exists in the "Armorial du Bibliophile" by J. Guigard.

Such a book of reference for English "super libros" is much wanted. To French workmen we in England owe, no doubt, much of our excellence in book decoration, as in many instances there have been large accessions to our native workmen, due to the immigration of Frenchmen, especially about the time of the revocation of the Edict of Nantes in 1685, and these workmen prospered here so well that I believe without exception they came to stay.

From 1401 until 1791 there existed in Paris a guild known as that of St. Jean Latran—an account of it will be found in Thoinan's "Les Relieurs Français"—and no doubt the encouragement given to "booksellers, printers, scribes, illuminators and binders" by this guild has largely contributed to the generally high level of French bookbinding, both from the technical and decorative points of view. An interesting outcome of the existence of this guild, which was equivalent to our trade unions, was the fact that the art, its secrets and special styles, were often preserved from father to son in the same family continuously for several generations.

* A Cantor lecture on "Decorative Bookbinding," by Cyril Davenport, published in the *Journal of the Society of Arts.*

The early sixteenth-century French bindings are generally in calf, stamped in blind. The smaller stamps are often arranged in perpendicular lines, and this characteristic is found in the few existing bindings made for Louis XII. A commoner form is the large panel stamp, usually of some scriptural subject, and often bearing the name of the binder on a border. Such are the works executed by Jean Norins, Louis Bloc, André Boule, R. Macé and several others, and in these bindings, always in blind, is no sign of Italian influence.

But from the earliest introduction of gold tooling in French bindings the designs are strongly of Italian character, the actual workmanship rapidly becoming of the highest technical excellence.

Francis I. possessed several fine bindings ornamented with gold toolings; they bear his badge of a salamander, and often also his crowned initial. They are sometimes supposed to have been bound by the artist Geoffrey Tory, who was "engraver and royal printer," and also bound books ornamented in gold with his own special designs, largely taken from Italian models, but nevertheless characteristic of himself. Whether Tory bound any of the fine bindings of Francis I. is not certain, but he is credited with having to some extent designed for Grolier. Indeed, in his "Champfleury" he mentions that he had been employed by Grolier to design some letters. On Tory's bindings is sometimes found his badge of a vase "qui est cassé, par lequel passe ung toret," the "toret," a play upon his name, being the instrument with which the china was pierced previous to putting in the rivets.

The French bindings executed for Jean Grolier are like the Italian ones, but have some small differences—the most notable being that the small leaf-shaped tools which are "solid" in the Italian examples are "azurés" or scored across with lines in the French. Another peculiarity is that the fillets in ribbons which interlace so effectively in many of these bindings are sometimes marked in the French examples with colour, black, red or blue.

The love of colour probably reached its strongest manifestation in the bindings made for Henry II., Catherine de Médicis, and Diane de Poictiers, Duchesse de Valentinois. On the bindings of each of these collectors the heraldic element enters largely. The colour is some kind of enamel when used simply as an additional ornament to the gold tooling, but when an entire coat of arms is painted, as in the case of Catherine de Médicis's copy of the works of Dionysius Areopagita, printed in Paris in 1562, now in the British Museum, then simple oil colours alone are used. On the bindings made for Diane de Poictiers her design of an arrow with laurel and a tomb often is found, with sometimes her coat of arms, "Bérzé impaling Poictiers." On the later bindings, however, are generally found bows, arrows, quivers, interlaced crescents and the cypher of the two D's reversed, the solution of the monogram being still unsolved, and generally there is a preponderance of white in the colouring.

On the bindings of books for all these three personages occur monograms, much resembling each other, concerning which there has been much controversy. On those bound for Henry II. are two D's reversed crossed by a bar, probably standing for "Henri Deux." On those bound for Catherine are H and C interlaced, and on those bound for Diane are simply two D's reversed. But on most of the bindings made for all these three personages the king's monogram with crown occurs as well as the others.

The "semis" or powdering of a small tool symmetrically over the field is found first in French books bound for Charles IX., and these were probably executed by Claude Piques, his "binder in ordinary." On some of Charles IX.'s books the royal coat of arms is painted in oils in the centre, and the "semis" is of crowned C's. At Lyons during the sixteenth century, and later, were produced numbers of beautifully coloured bindings, usually small, of interlacing fillets painted in some kind of enamel.

All the children of Henry II. and Catherine de Médicis seem to have liked fine bindings, and it is even said that Henry III. was himself an amateur in the art. His bindings often have upon them a death's head and religious mottoes. In his reign lived Nicholas Eve, one of whose bindings is in the British Museum. This binding covers a copy of the Statutes of the Order of the Saint Esprit, instituted by Henry III. It is one of the forty-two copies bound "et couverts de maroquin orenge du Levant, enrichis d'un costé des armoires de Sa Majesté pleines dorées, de l'autre de France et de Pologne, et aux quatre coins de chiffres, et le reste de flammes, avec leur fermoirs de ruban orenge et blue, suivant l'ordonnance de M. le Chancelier, du 26 et quittance du 27 déc. 1579."

The orange of the leather of this book is now faded, and the ties of orange and blue are nearly worn off, otherwise the book is in perfect condition. It is curious that the general style of decoration attributed to the Eves is not like that in this book, but is the kind known as "à la fanfare," richly and thickly covered with curving sprays of laurel and palm, spirals of conventional foliage and arabesques of graceful forms.

The workmanship of these bindings is very skilled, but the design is usually too full, and not always as consistent as it might be. There is very rarely any colour found in them. The style seems to be common during the time when Nicholas Eve was "Relieur du Roy," and in Thoinan's "Les Relieurs Français" there are given several names of binders of the time who may have used it, as also may Clovis Eve, the next royal binder but one to Nicholas.

Several very fine instances of elaborate bindings in the "fanfare" style were made for Jaques Auguste de Thou, president of the Parliament of Paris in the sixteenth century; for him the largest specimens I have ever seen were done. De Thou was a great collector of books, and besides the magnificent bindings, usually credited to Clovis Eve, that were made for him were numerous simpler ones, nevertheless most charmingly bound in splendid leathers, the colours of which were, to some extent, chosen according to the subject of the books they covered.

The centre ornament of these books is the coat-of-arms of their owner. At first the paternal coat alone, a chevron between three gadflies, and below it a monogram; then two coats, his own and that of his first wife, Marie Barbançon, with again a monogram, but this time containing an M in addition to the I.A.T.; and lastly, again two coats, his own and that of his second wife, Gasparde de la Chastre, and a monogram containing her initials as well as that of her husband.

In the seventeenth century appeared the binders Le Gascon and Florimond Badier, particularly. Their work and methods were very similar—indeed, some authorities consider them to be the same man. As far as I have been able to see, however, Badier's work is coarser than that of Le Gascon. Badier fortunately sometimes signed his work, so that his manner can be distinctly ascertained. Le Gascon is mentioned in the register of the Guild of St. Jean Latran in 1622. Badier married the daughter of Jean Gillede, binder, in 1645. Mr. Herbert P. Horne in the "Binding of Books" thinks it not unlikely that Gillede was "Le Gascon." There is no doubt that most exquisite work was done, usually on small books, by some very skilled workmen who invented a new style between about 1630 to 1665. The chief peculiarity from the finisher's point of view about the designs in these bindings is the use of "dots." Not only are "dots" effectively used by themselves, but even the smallest tools, which were hitherto used solid, are scored across so that the impression instead, for instance, of being a consecutive one-line spiral, becomes a spiral of brilliant points. The result is an effect of glittering lacework, and no style in all the history of decorative ideas applied to bookbinding has been so much copied as this of Le Gascon.

His moroccos are sometimes clouded and sometimes in mosaic, the edges of the leaves being generally gilt, sometimes with marbling under the gold, and sometimes painted. There is a strong resemblance in the "pointillé" curves to work executed in silver filigree with twisted wires, but whether this gave the idea to Le Gascon is an open question—I think very likely it was so.

The Ruettes—father and son—bound much in the style of Le Gascon, but without the mosaics.

The Count de Hoym had several of his bindings made by Boyet, whose work is notable for its excellent technical qualities, as well as for the doublures, or inner ornamentation, with which they are often decorated. This binder is also supposed to have bound for Hilaire Bernard de Requeleyne, Baron de Longepierre, an amateur writer of plays, one of which only reached some amount of popularity. This was called "Medea," and in allusion to it his books usually have upon them a charmingly cut stamp of a golden fleece. Du Seuil, although his name occurs in many sale lists, and he was actually one of the binders in ordinary to Louis XV., has left no instance of work that can positively be known as his.

The family of the Padeloups gave five generations of binders to the world; the most celebrated of them was Antoine Michel, called "le jeune." He was appointed binder in ordinary to Louis XV. in 1633, in conjunction with Du Seuil, who had married his cousin, and he was one of the wardens of the Guild of St. Jean. Padeloup le jeune often attached his ticket to his bindings, so that we can sometimes in his case be quite sure of the binder. He invented what is called the "dentelle" bindings, the borders being very broad and extending inwards from the outer edges of the boards towards the centres in an irregular manner, somewhat resembling a piece of lace edging. Padeloup also decorated several of his books with symmetrical patterns repeated all over each board with small inlays of coloured leather. The taste for these inlaid or mosaic bindings rapidly spread in France. Among the best of the many excellent workmen who made them during the eighteenth century may be mentioned Le Monnier, who recovered his freedom in 1757, Jacques Antoine Derome, and Nicholas Denis Derome. The Deromes's bindings resemble those of Padeloup in many particulars, the dentelle style of border especially is often used, and often the stamp of a little

bird with outstretched wings is worked into it; when this occurs it is called "dentelle à l'oiseau." There were about fifteen members of the family of the Deromes who were binders, but the two mentioned are best known, the latter being called "le jeune." Derome le jeune often put tickets in his books; he is considered to have sinned in the technical peculiarity of having cut the edges of his book too far inwards towards the text—this is called "cropping." He is also generally supposed to have been the first great binder to use the saw in the backs of his books, so as to sink the bands to more easily produce the flat backs. This plan was, however, actually used in England on embroidered books in the seventeenth century.

The Le Monniers, twenty of which family are known binders, were all excellent workmen, the best known being a father and son—Louis François and Jean Charles; the younger of these two used sometimes a ticket inside the book, and sometimes the name "Le Monnier" stamped on the outside of the bindings themselves.

One exquisite specimen of a Le Monnier binding is exhibited in one of the binding showcases in the King's Library at the British Museum. It is a copy of the Bible printed at Cologne in 1739, the design being the same on each side. The binding itself is red morocco, and on each board is a gracefully vandyked border inlaid with cream-coloured calf, in the corners and spaces on which are small flower groups with leaves all inlaid in differently coloured pieces of morocco, on which is delicate gold tooling, the lines of junction of the little pieces of leather being always carefully covered with a gold line. In the red space within the border is a very graceful spray of conventional flowers with buds and leaves all inlaid in a similar way, and gold tooled as well. On the rib of one of the larger leaves is the word "MONNIER," and it is also on the lower edge of the books impressed in gold. The whole of the red ground is covered with a series of gold dots.

The books which belonged to the three daughters of Louis XV. are sometimes met with out of large museums. They are simply and prettily bound with the same Royal coat of arms, but are remarkable because they are bound in leather of distinctive colours—those which belonged to Madame Adélaïde being in red, those which were the property of Madame Sophie and Madame Victoire respectively being in citron and olive.

Later, the tradition of fine bindings among the French has been well maintained by the fine work of such binders as Duru, Thouvenin, Trautz-Bauzonnet, Capé and many others, technically of the highest excellence, but from the artistic aspect wanting in originality and life.

3. *Germany.*

As a whole the most noticeable peculiarity about the German bindings from the sixteenth century onwards is the prevalence of panel stamps with portraits. On the earlier cut-leather work exist several figures—saints and monks; but the identity of these, I think, is not known. It is, indeed, possible they are not portraits at all, but the large majority of the panel-stamped portraits are named. Dates are also often found on them, and they are always on calf, vellum or pigskin.

The gold used on German bindings of all periods is curiously inferior. It has often changed colour completely, and is now quite black; at other times it has a strong coppery tinge, and again is very pale. The decorators of these books trusted to the fine impressions on the leather to impart distinction and beauty to their work, and in many cases they were fully justified.

Several German bindings bear portraits of personages connected more or less closely with the Augsburg Confession, proclaimed at Augsburg in 1530 by John, Elector of Saxony, whose portrait occurs in gold on a copy of the Confession itself, surrounded by small stamps in blind of Moses, St. Paul, the Agnus Dei, &c. The portrait of another strong adherent of the "Confessio des Glaubens," Graf Churfurst Friedrich Pfalcz, adorns another binding dated 1561. He is surrounded by a roll stamp, on which are portraits of Erasmus, Martin Luther, Philip Melanchthon and John Huss, some of them bearing the dates 1554 and 1559. Besides the roll are other rather larger stamps with representations of David with a harp, St. Paul, the Ancient of Days and allegorical figures of Hope, Prudence, Faith and Justice. This Churfurst Friedrich was an important person. He promulgated a "Confession of Faith" of his own, and took part in the election of the Emperor Maximilian II., who afterwards summoned him before him to justify some of his religious opinions.

Certainly one of the finest panel stamps used on German bindings is one of the Emperor Charles V. The emperor is in full armour, with a sword in his right hand and an orb in his left. His helmet is by his side. Above his head are the arms of Germany, and in the corners the arms of Aragon, Aragon-Sicily and Spain, of which countries Charles was king. On the columns on each side of him winds a ribbon with the words "Plus ultra Carol Quint," and beneath in a long-shaped panel the inscription, "Carole, mortales dubitant Homo sisne Deusve. Sunt tua sceptra hominis sed tua facta Dei." The engraving of this panel is wonderfully fine; it is like a medal in leather.

Charles resigned his crown in 1556, and in 1557 he became a monk in the monastery of St. Just in Estremadura, his chief amusement being to try to make two clocks of his own workmanship keep perfect time together. On books ornamented with this stamp, an equally fine one, probably cut by the same artist, of John Frederick II., Duke of Saxony, occurs on the other side.

Luther and Melanchthon have perhaps been more represented on bookbindings than any other persons. Portraits of them, of all sizes, from full-length to very small roll stamps, are commonly found sometimes in gold but usually plain, and very frequently with dates added; the stamps themselves are not of particularly good workmanship, and they are impressed both on calf and pigskin. A very fine panel stamp exists of Maximilian II., Emperor of Germany, who died in 1576. This stamp, as far as I know, is always on vellum or pigskin. The emperor is crowned, and is in royal robes over armour. He carries a sceptre in his right hand and an orb in his left, and round his neck the jewel of the Order of the Golden Fleece. At the top are two escutcheons, one bearing the double-headed eagle of Germany, the other the arms of Spain quartered with Sicily. Beneath in an oblong panel are the words, "MAXIMILIANVS II. D. G. ROM. IMP. SEM. AVGVS. GERMA. HVNGA. BOHEMI. ETC. REX. ARCHID. AVSTRI. DVX SILESIE."

Besides these great people, there are hosts of others represented in a similar kind of way, from simple preachers like "Primus Truber Carnio" to grandees like Louis the Pious, Duke of Würtemberg, with very often on the other side elaborate coats-of-arms with many quarterings and many crests.

Some of the sixteenth-century German bindings have chains attached to them; no doubt they were chained to the shelves or desks on or in which they were kept. Others, again, have long projecting tags of leather with a button at the end to fasten to a belt.

Bindings in metal were made to a considerable extent in Germany, some of fine workmanship. An especially good example covers a copy of Bassiere's "Flosculi Historiarum," now in the British Museum. On each side is a delicate panel of filigree silver-work over gilt, having in the centre an elongated silver oval with niello designs upon it in dark grey. The borders are also ornamented with niello. This binding is probably sixteenth-century work, earlier than the work it now covers. A fine seventeenth-century example of pierced and engraved metal-work, with a curiously jointed double back, is a copy of Orteln's "Frauenzimmer Spiegel." It is gilt over satin, and has flat metal caps over the inner edges of the leaves at the head and tail of the book.

In the eighteenth century many bindings in silver, much alloyed, were made in Germany. They are usually repoussé, or stamped up in a more or less artistic manner, and often have portraits of eminent personages upon them. They are best when only arabesque or floral designs are on them, and are much like Dutch work, indeed, it is often difficult to say whether they are really Dutch or German.

At all times there are many names of German binders upon the bindings themselves. These names are generally upon a short ribbon. The best known among them are perhaps John Sulczpach, Johannes Hagmeyer, Ambrose Keller and Johannes Vogel, all early binders. Besides these full names are many initials. Later Dutch bindings are often ornamented with water-colour silver paint in addition to the gold tooling.

The Dutch imitated, with marked success, most of the well-known styles of binding. Magnus and Poncyn, both of Amsterdam, are amongst the best imitators of Le Gascon. The English embroidered books have been more copied by the Dutch than any other nation. Many of the edges of Dutch books are very elaborately painted. In Holland, however, one style seems to have been invented, namely, the very decorative bindings in tortoise-shell, or, as it should be called, turtle-shell. They are usually strengthened with metal clasps and corners, and if in good condition are very decorative. In Spain also tortoise-shell was used with fine effect, the metal-work being of a finer kind than the Dutch. Little is known in this country about Spanish bindings. Those that are to be found in our great libraries are usually heraldic and decorative and of good design and workmanship. The same may be said of Portuguese bindings. In the East, in comparatively recent times, an interesting kind of work was invented, probably originating in Persia somewhere about the beginning of the sixteenth century. These bindings are of paper boards, covered with some kind of white paste, on which are paintings of more or less delicacy, which were when finished varnished thickly with a yellowish glaze. Some of the earliest of these Persian bindings are of great delicacy and beauty, often representing hunting scenes, but through the excessive darkening of the varnish upon them, they are almost impossible to see, and, as far as I have found, quite impossible to photograph. The style was quickly taken up in India, and bindings of this kind are common enough.

NOTES AND COMMENTS.

THE sub-committee for fine arts of the Brighton Corporation have arrived at the following resolutions about the collections in the Gallery:—"That students wishing to copy the historical water-colours at the Corporation Gallery shall be admitted on the mornings of Mondays, Wednesdays and Fridays, from 10 A.M. to 1 P.M. Application to be made to the curator, accompanied by a specimen of the applicant's work, or, in the case of School of Art students, a note from the art master. That Mr. DE PARIS's generous offer to give a course of lectures in the Art Gallery, explaining the rise and development of water-colour painting in England, as illustrated by the collection, be accepted, and that the lectures be given on Wednesday evenings, from 8 to 10 o'clock. That the autumn exhibition of oil colours commence on Saturday, November 5—the last day for sending in to the London agent being Saturday, October 22. That the chairman be empowered to take the necessary steps for securing a loan from the Science and Art Department of the second series of historical water-colours for June 1900—the earliest date at which they will be available."

THE interest which must always be attached to the name of DRYDEN has not been diminished while borne by Sir HENRY, the present possessor of Canons Ashby. He has upheld archæology with the loyalty of a cavalier ancestor. Sir HENRY DRYDEN has not only helped archæologists with his knowledge, but he has enabled them to use collections which, as he says, have cost him much time, money and miles. Sir HENRY has put a crown on his life-work by offering his large collection of drawings, both measured and freehand, of antiques, buildings of various kinds, views, &c., relating to England, and especially to Northamptonshire, to the public library and museums committee of the Town Council of Northampton. He is naturally anxious that these should be preserved for the information of persons interested in such matters. No place is so fit a repository as the county town. The antiques found in the county are already in the museum. A few others at Canons Ashby would go with the drawings, as well as some seals and coins and tokens. The papers consist of (1) rolls of plans, rubbings, &c., some 5 feet long; (2) flat papers in portfolios of various sizes, from 4 feet 5 inches by 2 feet 8 inches to 6 inches by 4 inches (mainly ½ imperial and ¼ imperial), of which some are water-colours and others freehand outlines, but most are scale drawings; (3) portfolios and boxes of notes and extracts (classified) of various sizes, but mainly foolscap 4to, relating to various parts of England and various subjects; (4) deeds and old documents or copies of them; (5) prints in portfolios of various sizes; (6) ordnance maps and other maps; (7) "squeezes" or paper casts; (8) letters concerning antiquarian matters (arranged). Assuming, first, that these collections are of value, and especially in the county, Sir HENRY DRYDEN wishes the committee of the museum to consider whether they can and will accept them on the condition of keeping them dry and in such a way that they could be inspected and consulted with security. At the present time there is no such accommodation, nor would the addition of a room to the reference library, as proposed, be sufficient. Besides, the committee should not look on the gift as a finite acquisition but as the beginning of a great county collection. The committee have, of course, gladly accepted so valuable a gift, and space will be provided for the Dryden collection. It is rarely that similar records are obtainable. Pictures and curiosities can be purchased at any time, but there are few archæologists who resemble Sir HENRY DRYDEN, and without devotion to the past such as he has displayed it is impossible to secure so much evidence about English archæology.

SIR CHARLES LYELL long ago printed as a motto on the title-page of one of his treatises on geology a sentence from MACAULAY on the Baconian philosophy, which he considered to be peculiarly applicable to geological science. It ran thus:—"It is a philosophy which never rests, which is never perfect. Its law is progress. A point which yesterday was invisible is its goal to-day, and will be its starting-post to-morrow." The difficulty of attaining perfection, which is only another word for accuracy, in geology is suggested by the remarks made by Mr. HUDDLESTON in his address to the Geological Section at Bristol. He took for his subject the region in which Bristol stands, between the British and the English Channels, which on account of WILLIAM SMITH having resided there he claimed to be the birthplace of stratigraphical palæontology and the original home of systematic geological survey. That region is shown on two of the Geological Survey's sheets. But it will be found that the mapping of the formations is undergoing continual changes. "Ever since the days of JUKES," said the President, "that region has been fruitful in what I must continue to regard as heresy," and the geological surveyors are no more able to reveal what is truth than the unofficial inquirers. In the new index map the culm-measures are placed below the carboniferous limestone, although apparently they belong to the latter. A series of beds hitherto described as trias are shown as permian. Dolomitic conglomerate and red marl are now included under the same symbol and colour. At one time from the map inferior oolite was supposed to rest directly on lower lias at Dundry. Now it is proved that middle and upper lias beds intervene. All these changes may seem of little importance to the uninitiated. But there are industrial problems which are to be solved in different ways according to the character of the formation which is involved. There is, for instance, much speculation about the likelihood of obtaining coal eastward of Bath and elsewhere in the district. The determination of the position of a bed in one or other series would make exploration a hopeful or a hopeless operation.

IT is proposed as a matter of course that a statue of CHARLES GARNIER should be erected in Paris. Several men of note have agreed to join the committee, but as yet subscriptions have not come in. The Société Centrale des Architectes suggest that the most eligible site would be in the open space before the Opera House. M. SARCEY, who is accepted as embodying French good sense, and who is a member of the committee, is, however, not only opposed to that site, but he says that neither Madame GARNIER nor her son would approve of it. They would say that the late architect always combatted all schemes which contemplated the erection of any work that would interfere with the perspective of the façade. The most fitting place, according to M. SARCEY, would be somewhere within the building, where there are busts already of SCRIBE and PERRIN.

IT is difficult to represent geological phenomena by drawings on a small scale, as the details of a Gothic cathedral. As a consequence there is commonly much scepticism about the accuracy of the diagrams in books on geology. In the "Geology for Beginners" by Mr. W. W. WATTS, F.G.S. (MACMILLAN & Co.), reproductions of photographs are employed most liberally, and the little volume by that means has an aspect of reality which distinguishes it from similar manuals. Views are printed of phenomena in many parts of Great Britain and Ireland. In addition, copies are given of microscopic sections. Petrology and lithology are therefore as well represented as it is possible to have them in a book. Mr. WATTS's treatise testifies to varied experience, and for anyone who wishes to know something of the latest tendencies of geological science the book is well adapted. The questions are carefully selected from a variety of examination papers.

ARCHITECTURAL competitions appear to be coming into more general favour in Germany. The latest instance is one for the Museum in Magdeburg, which will have to contain most valuable collections of works of art. A competition was arranged and prizes of 4,500, 2,000 and 1,000 marks were offered. Seventy-nine designs were sent in. The judges were Professor WALLOT, of Dresden; Professor VON THIERSCH, of Munich; Herr LICHT, the city architect of Leipzig; and Burgomaster SCHNEIDER, of Magdeburg. The first prize was awarded to the firm of KUDER & MÜLLER, of Strassburg; second prizes were awarded to Herr RISSE, of Dresden, and SCHMIDT & HESSEMER, of Munich; third prizes were gained by MEIER & WERLE, of Berlin, and F. THYRIOT, of Berlin. It was recommended that three other designs should be purchased.

ILLUSTRATIONS.

BANK BUILDINGS, WELLINGTON CLUB, ETC., READING.

THE principal portions of these buildings have recently been erected at the corner of Friar Street and Station Road. The ground floor and basement of corner block will be occupied by the Metropolitan Bank, Limited, the accommodation being a large strong-room in basement, with lavatories, &c., a hydraulic lift connecting it with the rooms on the next floor. The ground floor consists of a large telling-room, with public entrance at the corner, and the usual private offices used for banking purposes.

The return front to the Station Road is occupied by the large block of buildings called the Wellington Club, a Conservative and Unionist Club that has been in existence for nearly twenty years. In the new club the requirements of both town and country members have been admirably provided for, viz. the basement consists of large kitchen, servants' hall, scullery, extensive cellars and the usual domestic offices. The ground floor consists of large entrance hall and hat and coat lobby, a second entrance lower down the road for cyclist members leading to a cycle house, with an additional hat and coat lobby. There are two large billiard-rooms, reading-room with bay window, smoking-room, card-room, large smoking lounge, lavatories, &c., and a half-covered court for American bowls. The first floor comprises a large dining-room with bay window and a small room as an annexe for private tables. The dining-room is connected by a lift and separate service staircase. A room for the secretary is also provided. There are various other rooms on this floor which are available if required. The staircase is very handsome, and of teak and walnut.

The second floor has a private dining room connected by means of the service-lift and staircase. There are various rooms on this floor to be let as bedrooms to members. A large bath-room is available on this floor, with the usual lavatory accommodation. The third floor consists of various rooms for the private use of the steward, and a sitting-room and various bedrooms for the staff.

The shops, when erected, will extend to the Great Western Hotel, as shown by the view. The front is of the best selected red bricks and buff terra-cotta. The entrances are of polished granite of various tints.

The whole of the buildings have been carried out from the designs and under the superintendence of the joint architects, Messrs. F. W. ALBURY, F.R.I.B.A., and GEO. W. WEBB, F.R.I.B.A., of Reading. The contractors are Messrs. G. S. LEWIS & BROTHER, of Castle Street, Reading, and the clerk of the works Mr. WALKER. The chairman of the Club Company, Limited, Mr. F. J. FERGUSON, has given much time and attention to the various details connected with the undertaking.

CATHEDRAL SERIES.—SOUTHWELL: FROM NORTH-WEST.

ADDITIONS TO A HOUSE AT WEST FINCHLEY.

A DECORATIVE PANEL.

THIS plate is reproduced from a drawing exhibited this year at the Royal Academy.

PROGRESS IN PREHISTORIC PERIODS.

THE presidential address in the Anthropological Section of the British Association was delivered by Mr. E. W. Brabrook, C.B., F.S.A. In the course of it he said :—

Great as is the diversity of the anthropological sciences, their unity is still more remarkable. The student of man must study the whole man. No true knowledge of any human group, any more than of a human individual, is obtained by observation of physical characters alone. Modes of thought, language, arts and history must also be investigated. This simultaneous investigation involves in each case the same logical methods and processes. It will in general be attended with the same results. If it be true that the order of the universe is expressed in continuity, and not in cataclysm, we shall find the same slow but sure progress evident in each branch of the inquiry. We shall find that nothing is lost, that no race is absolutely destroyed, that everything that has been still exists in a modified form, and contributes some of its elements to that which is. We shall find that this, which no one doubts in regard to physical matters, is equally true of modes of thought. We may trace these to their germs in the small brain of the palæolithic flint-worker, or, if we care to do so, still farther back. This principle has, as I understand, been fully accepted in geology and biology, and throughout the domain of physical science—what should hinder its application to anthropology? It supplies a formula of universal validity, and cannot but add force and sublimity to our imagination of the wisdom of the Creator. It is little more than has been expressed in the familiar words of Tennyson :—

> Yet I doubt not thro' the ages one increasing purpose runs,
> And the thoughts of men are widen'd with the process of the suns.

From the first moment that man recognised the advantage of using a club or a stone in attack or defence, the direct incentive to a higher brain development came into existence. The man who first used a spear tipped with a sharp flint became possessed of an irresistible power. In his expeditions for hunting, fishing, gathering fruit, &c., primitive man's acquaintance with the mechanical powers of nature would be gradually extended; and thus from this vantage point of the possession of a hand, language, thought, reasoning, abstract ideas would gradually be acquired, and the functions of the hand and the brain be developed in a corresponding manner. I do injustice to Dr. Munro's masterly argument by stating it thus crudely and briefly. It amounts to this—once the erect position is obtained, the action of the man being controlled by a progressive brain, everything follows in due course.

The next stage which we are yet able to mark with certainty is the palæolithic, but there must have been a great many intermediate stages. Before man began to make any implements at all, there must have been a stage of more or less length, during which he used any stick or stone that came to his hands without attempting to fashion the one or the other. Before he acquired the art of fashioning so elaborate an implement as the ordinary palæolithic axe or hammer, there must have been other stages in which he would have been content with such an improvement on the natural block of flint as a single fracture would produce, and would proceed to two or three or more fractures by degrees. It must have been long before he could have acquired the eye for symmetry and the sense of design, of adaptation of means to end, which are expressed in the fashioning of a complete palæolithic implement. It is probable that such rude implements as he would construct in this interval would be in general hardly distinguishable from flints naturally fractured. Hence the uncertainty that attaches to such discoveries of the kind as have hitherto been made public. Professor McKenny Hughes, who speaks with very high authority, concludes a masterly paper in the *Archæological Journal* with the statement that he has "never yet seen any evidence which would justify the inference that any implements older than palæolithic have yet been found." The name "palæotalith," which had been suggested for prepalæolithic implements, seems to him unnecessary at present, as there is nothing to which it can be applied, and as it will be long before it can be asserted that we have discovered the very earliest traces of man, he thinks it will probably be long before the word is wanted. An elaborate work on the ruder forms of implement, just published by M. A. Thieullen, of Paris, who has for many years been engaged in collecting these objects, adds materially to our knowledge of the subject. The question is one of great interest, and I hope it will come up for discussion in the present meeting.

Another line of argument bearing strongly in the same direction is afforded by the discovery in various places of works of art fabricated by early man. The statuettes from Brassempouy, the sculptures representing animals from the Bruniquel, the well-known figure of the mammoth engraved on a piece of ivory from Périgord, and many other specimens of early art attest a facility that it is not possible to associate with the dawn of human intelligence. M. Salomon Reinach tells an amusing story. A statuette in steatite of a woman, resembling in some respects those of Brassempouy, was discovered in one of the caverns of Mentone as far back as 1884, but when the discoverer showed it to a personage in the locality, that authority advised him not to let it be seen lest it should take away from the belief in the antiquity of the caves, it being then thought too artistic to be consistent with early man. The finder acted on this advice, in ignorance of the real interest of the statuette, until April 1896, when he showed it to M. Reinach and M. Villenoisy, who promptly interviewed the sage adviser in question, and obtained a confirmation of the statement. Some interesting additions to our gallery of prehistoric art have been recently made by M. Emile Rivière and M. Berthoumeyrou at Cro-Magnon, in the Dordogne. These are a drawing of a bison and another of a human female in profile. Among the other objects found in the same place were some flint implements brought to a fine point, suitable for engraving on bone or horn.

The idea of making in any form a graphic representation of anything seen has never, so far as I know, occurred to any lower animal, and it could hardly have been among the first

ideas formed in the gradually developing human brain. When that idea is found carried out with remarkable artistic skill by means of implements well adapted for the purpose, we may surely assume that the result was not obtained till after a long interval of time, and was approached by gradual steps marked by progress in other faculties, as well as in the artistic faculty. It may be that some day all uncertainty on this head will be removed by decisive discoveries.

The interval between the palæolithic and neolithic periods rests in the like condition of incertitude. That by some means, and somewhere on the face of the globe, the one period gradually passed into the other we cannot but believe. That the transition between them may have involved innumerable degrees is also highly probable. Where and when and how each step was taken we do not know at present, and possibly never shall know. The problem is not satisfactorily solved by the production of palæolithic implements resembling neolithic forms, or neolithic implements resembling palæolithic forms, inasmuch as between the one period and the other an interval of time involving geological and other changes has to be accounted for.

In this respect, also, our best authorities are the most cautious and conservative. In the excellent address which Professor Boyd Dawkins delivered to the Royal Archæological Institute at the Dorchester meeting last year on the present phase of prehistoric archæology, he contrasted the few primitive arts, such as sewing and the manufacture of personal ornaments and rude implements of the chase, possessed by the palæolithic hunters—apart from their great proficiency in the delineation of animals—with the variety of arts, such as husbandry, gardening, spinning, weaving, carpentry, boat-building, mining and pottery-making, possessed by the neolithic herdsmen, and held that between the two there is a great gulf fixed. Somewhere that gulf must be bridged over. Professor Boyd Dawkins says that the bridge is not to be found in the caverns of the South of France. It is difficult to meet his argument that the presence of grains of barley and stones of the cultivated plum at Mas d'Azil are evidences of neolithic civilisation. His objections to other discoveries are not so strong as this, but are strong enough to make us pause. The tall, long-headed people, whose remains were found at Cro-Magnon, he holds to be early neolithic and not palæolithic, to stand on the near side and not on the far side of the great gulf.

These considerations lend importance to the discoveries which have been laid before this Association at previous meetings by Mr. Seton-Kerr, and which have also been commented upon by Professor Flinders Petrie and Sir John Evans. If we are compelled to admit a breach of continuity in Europe, is it in Africa that we shall find the missing links? That is another of the great problems yet unsolved, upon which I hope the discussions at the present meeting may throw some light. The evidence we want relates to events which took place at so great a distance of time that we may well wait patiently for it, assured that somewhere or other these missing links in the chain of continuity must have existed and probably are still to be found.

The next stage, which comprises the interval between the neolithic and the historic periods, was so ably dealt with by Mr. Arthur J. Evans in his address to this section at the Liverpool meeting that it does not call for any observations from me. Two committees appointed by the Association in connection with this section touch upon this interval, the committee for investigating the lake dwelling at Glastonbury and the committee for co-operating with the explorers of Silchester in their well-conducted and fruitful investigation of the influence of Roman civilisation on a poor provincial population. I pass on to consider the very great progress that has been made of late years in some of the branches of anthropology other than physical and prehistoric, and especially in that of folk-lore. I do this the more readily because I do not recollect that folk-lore has ever before been prominently referred to in an address to this section. It is beginning to assert itself here, and will in time acquire the conspicuous position to which it is becoming entitled, for the British Association is sensitive to every scientific movement, and responds readily to the demands of a novel investigation. Already, for three or four years, a day has been given at our meetings to folk-lore papers; and at the Liverpool meeting an exceedingly philosophic, and at the same time practical, paper was read by Mr. Gomme, and is printed *in extenso* in the proceedings as an appendix to the report of the ethnographic survey committee. The term "folk-lore" itself is not without a certain charm. It is refreshing to find a science described by two English syllables instead of by some compound Greek word. The late Mr. W. J. Thoms had a happy inspiration when he invented the name. It is just twenty years since the Folk-lore Society was established under his direction. It has accumulated a vast amount of material and published a considerable literature; it is now rightly passing from the stage of collection to that of systematisation, and the works of Mr. J. G Frazer, Mr. E. Sidney Hartland and others are pointing the way towards researches of the most absorbing interest and the greatest practical importance.

A generalisation for which we are fast accumulating material in folk-lore is that of the tendency of mankind to develop the like fancies and ideas at the like stage of intellectual infancy. This is akin to the generalisation that the stages of the life of an individual man present a marked analogy to the corresponding stages in the history of mankind at large, and to the generalisation that existing savage races present in their intellectual development a marked analogy to the condition of the earlier races of mankind. The fancies and ideas of the child resemble closely the fancies and ideas of the savage, and the fancies and ideas of primitive man.

An extensive study of children's games, which had been entered into and pursued by Mrs. Gomme, has been rewarded by the discovery of many facts bearing upon these views. A great number of these games consist of dramatic representations of marriage by capture and marriage by purchase—the idea of exogamy is distinctly embodied in them. You will see a body of children separate themselves into two hostile tribes, establish a boundary line between them, demand the one from the other a selected maiden, and then engage in conflict to determine whether the aggressors can carry her across the boundary or the defenders retain her within it.

There can be little doubt that these games go back to a high antiquity, and there is much probability that they are founded upon customs actually existing, or just passing away at the time they were first played. Games of this kind pass down with little change from age to age. Each successive generation of childhood is short; the child who this year is a novice in a game becomes next year a proficient and the year after an expert, capable of teaching others, and proud of the ability to do so. Even the adult recollects the games of childhood and watches over the purity of the tradition. The child is ever a strong conservative.

Upon the same principle, next to children's games children's stories claim our attention. Miss Roalfe Cox has collected, abstracted and tabulated not fewer than 345 variants of Cinderella, Catskin and Cap o' Rushes. These come from all four quarters of the globe, and some of them are recorded as early as the middle of the sixteenth century. These elaborate stories are still being handed down from generation to generation of children, as they have been for countless generations in the past. Full of detail as they are, they may be reduced to a few primitive ideas. If we view them in their wealth of detail, we shall deem it impossible that they could have been disseminated over the world as they are otherwise than by actual contact of the several peoples with each other. If we view them in their simplicity of idea we shall be more disposed to think that the mind of man naturally produces the same result in the like circumstances, and that it is not necessary to postulate any communication between the peoples to account for the identity. It does not surprise us that the same complicated physical operations should be performed by far distant peoples without any communication with each other; why should it be more surprising that mental operations not nearly so complex should be produced in the same order by different peoples without any such communication? Where communication is proved or probable it may be accepted as a sufficient explanation; where it is not provable there is no need that we should assume its existence.

The simple ideas which are traceable in so many places and so far back are largely in relation with that branch of mythology which personifies the operations of nature. Far be it from me to attempt to define the particular phase of it which is embodied in the figure of Cinderella as she sits among the ashes by the hearth, or to join in the chase after the solar myth in popular tradition. The form of legend which represents some of the forces of nature under the image of a real or fictitious hero capable of working wonders appears to be widely distributed.

Lord Bacon, who says "The earliest antiquity lies buried in silence and oblivion. . . . This silence was succeeded by poetical fables, and these at length by the writings we now enjoy; so that the concealed and secret learning of the ancients seems separated from the history and knowledge of the following ages by a veil or partition-wall of fables interposing between the things that are lost and those that remain," has shown in his "Wisdom of the Ancients" that classical mythology was in truth a vast system of nature-worship, and in so doing has done more than even he knew, for he has affiliated it to those ideas which have been so commonly formed among rude and primitive peoples. It is true, he says, fables in general are composed of ductile matter that may be drawn into great variety by a witty talent or an inventive genius, and be delivered of plausible meanings which they never contained. But the argument of most weight with him, he continues, "is that many of these fables by no means appear to have been invented by the persons who relate and divulge them, whether Homer, Hesiod, or others; but whoever attentively considers the thing will find that these fables are delivered down and related by those

writers, not as matters then first invented and proposed, but as things received and embraced in earlier ages. The relators drew from the common stock of ancient tradition and varied but in point of embellishment, which is their own. This principally raises my esteem of these fables, which I receive, not as the product of the age or invention of the poets, but as sacred relics, gentle whispers and the breath of better times, that from the traditions of more ancient nations came at length into the flutes and trumpets of the Greeks."

Except that he supposes them to be a relic of better times, the poet's dream of a golden age no doubt still ringing in his ears, Bacon had in this as in many other matters a clear insight into the meaning of things.

To return. If continuity be the key that unlocks the receptacle where lie the secrets of man's history—physical, industrial, mental and moral; if in each of these respects the like processes are going on, it follows, as I have already said, that the only satisfactory study of man is a study of the whole man. It is for this reason that I ask you to take especial interest in the proceedings of one of the committees of this section, which has adopted such a comprehensive study as the guiding principle of its work. I mean the ethnographical survey committee. I have so often addressed this section and the Conference of Corresponding Societies on the matter since the committee was first appointed at the Edinburgh meeting, on the suggestion of my friend Professor Haddon, that I can hardly now refer to it without repeating what has been already said, or forestalling what will be said when its report is presented to you, but its programme so fully realises that which has been in my mind in all that I have endeavoured to say that I must make one more effort to enlist your active interest in its work.

The scheme of the committee includes the simultaneous recording in various districts of the physical characters, by measurement and by photography, the current traditions and beliefs, the peculiarities of dialect, the monuments and other remains of ancient culture, and the external history of the people. The places in the United Kingdom where this can be done with advantage are such only as have remained unaffected by the great movements of population that have occurred, especially of late years. It might have been thought that such places would be very few; but the preliminary inquiries of the committee resulted in the formation of a list of between 300 and 400. So far, therefore, as the testimony of the very competent persons whose advice was sought by them is to be relied on, it is evident that there is ample scope for their work. At the same time, the process of migration from country to town is going on so rapidly that every year diminishes the number of such places. One thinks with regret how much easier the work would have been one or two or three generations ago; but that consideration should only induce us to put it off no longer. The work done by the lamented Dr. Walter Gregor for this committee in Dumfriesshire and other parts of Scotland is an excellent type of the way in which such work should be done. His collections of physical measurements and of folk-lore have been published in the fourth and fifth reports of the committee. There can be no doubt that few men possess the faculty he had of drawing forth the confidence of the villagers and getting them to tell him their superstitions and their old customs. He succeeded in recording from their lips not fewer than 733 items of folk-lore. They not merely form exceedingly pleasant reading, such as is perhaps not often met with in a British Association report, but they also will be found to throw considerable light on the views which I have ventured to lay before you. It is much to be wished that others who have the like faculty, if even in a lesser degree, could be induced to take up similar work in other districts, now that Dr. Gregor has so well shown the way in which it ought to be done.

SOMERSET ARCHÆOLOGICAL SOCIETY.

THE fiftieth annual meetings of the Somersetshire Archæological and Natural History Society commenced at Taunton on August 31, and extended over four days. In order to celebrate the jubilee by a permanent memorial, says the *Somerset County Gazette*, it is proposed to restore the ancient hall of Taunton Castle, the property of the Society and the locale of the county museum. In the year 1873 the Society obtained possession of the castle by purchase for the sum of 2,850*l.*, and subsequently an adjoining property intimately connected with the castle, and forming part of the original grounds, was acquired at an additional cost of 460*l.* The Society is indebted to the late Colonel Pinney, of Somerton Erleigh (who has just bequeathed 300*l.* to the Castle Restoration Fund), for having presented a piece of garden ground on the north-east of the main property. To discharge the purchase money and the expense of certain repairs then immediately required, 2,000*l.* was raised by public subscription amongst the members of the Society and others interested in the county, who were desirous that so important an historical building should be preserved in the hands of a public Society, and the remainder, 1,500*l.*, was lent upon the security of the property. The whole of this has since been discharged from similar sources, and the property has for some years been practically free from debt. But although various absolutely necessary repairs have from time to time been carried out, in particular the entire reroofing of the western portion of the building (in which the more valuable part of the Society's collections is stored) and the very recent reroofing and reflooring of the entrance gateway, the Society's funds have never admitted of its undertaking any but the most necessary incidental repairs in perhaps the most important part of the buildings, the ancient hall. This from its size, 120 feet by 31 feet, and 20 feet in height, the roof covering an area of 3,720 square feet, renders any general dealing with it a matter of considerable expense. It is proposed that the hall should be put in thorough order and utilised for the preservation and exhibition of the very important natural history and other collections now from want of space crowded away in cupboards and boxes and practically unavailable for any useful purpose. As to the history of the castle, it may be observed that the fortress was founded by Ina, King of the West Saxons, in 702, a period nearly 200 years earlier than any other fortress mentioned in the Saxon Chronicle. It was destroyed in a rebellion in 722, and afterwards rebuilt. In the following reign, then a royal residence, it was given with the Manor of Taunton Deane to the church of Winchester. Most of the present buildings were erected by Bishop Gifford in the reign of Henry I., and added to by subsequent bishops. In 1496 the castle was seized by the Cornish rebels, who here murdered the Provost of Penrhyn, and in the following year it was again occupied by the rebels under Perkin Warbeck. The castle played a very important part in the Civil War in the reign of Charles I., being taken and retaken by both parties, and ultimately held by the renowned Robert Blake, "Admiral and General at sea," against a very superior Royalist force. The notorious Judge Jeffreys held his "Bloody Assize" in the great hall.

Local Loan Exhibition.

An interesting loan exhibition of local objects was formed and laid out in the castle hall. This included old prints of Taunton, portraits of old Tauntonians, old election addresses and squibs, two ancient carved oak doors supposed to have come from Taunton Priory, play-bills of the old Taunton Theatre (including some of the great Kean's) and many other things. Among the Taunton election addresses was that of Benjamin Disraeli, who, "young and alone, is engaged in a not inglorious struggle with the most powerful person in Europe who does not wear a crown," this being Daniel O'Connell, who on this occasion described the future Prime Minister of England as the heir-at-law of the impenitent thief who reviled the great Founder of the Christian religion.

The meetings commenced with a reception by the mayor (Alderman W. Potter) at the Municipal Hall, where by permission of the Town Council the annual general meeting of the Society was afterwards held.

Mr. E. J. Stanley, M.P., presided. He said that probably some of them were surprised to see him occupying the chair at their annual meeting for the second time in succession, but unfortunately the Council to whom was deputed the duty of electing the President for the year had unanimously conferred the position upon him again.

Taunton Castle.

A move was first made to Taunton Castle, where from the courtyard Mr. Buckle gave a description of the ancient building. He said that the castle was a very curious building in many ways, and from the courtyard one saw a number of rough walls, which were for the most part full of modern windows. The first idea that struck the observer on looking at the exterior of the castle was that there was really nothing left but a modern production of the old structure. The more one looked into it the more would one find that there was a great deal of work in the castle of various dates, and some of it was of very great antiquity. The site of the castle lay very low, it was only just above the level of the river Tone, and the rise was very slight indeed. But so long as the position chosen for the castle was not lower than any of the ground immediately around it, that was sufficient for the purposes of a Mediæval fortress. The situation chosen was one upon the edge of the river, and it occupied a position in the middle of a broad, flat valley, with high hills all round, and the spot must have been in early times to a large extent a marsh. There appeared to have been a natural stream coming from the Blackdown Hills, and this stream formed the outer moat. What was now called Corporation Street was just inside the moat, and they would observe that the backyards of the street had a decided fall, which formed the moat. The moat went along nearly to the main street of the town and then went into the river. The market-place formed the outer court of the castle, and the principal entrance was by the existing gateway or arch

at Clarke's Hotel. What was now the Winchester Arms Hotel was a portion of the other gateway to the castle, though there was now nothing left there of the original building except a rough piece of wall. There was and still remained a mill stream which ran parallel to the river Tone, and there was very little doubt that the mill itself, which occupied a position on the stream, was a building of very great antiquity. It must have been originally placed there for the purpose of providing the inhabitants of the castle with bread. The earliest mention that they had of the castle was recorded in the Saxon Chronicle in the year 722. It was said that Queen Ethelburga took Taunton, which was then in the hands of the rebels, and destroyed works which King Ina had built. From that they knew that King Ina did some building there in the year 722, and the popular idea was that the king fortified the position by throwing up a great mound of earth and putting up a palisade. After King Ina, Bishop Gifford, in the time of Henry I., built a castle there, which was the principal building now existing. This castle was the principal house of the manor of Taunton Deane, which was sometimes said to be the largest manor in England. It formerly belonged to the Bishop of Winchester. Bishop Gifford built the Norman keep of the castle. The structure was continually being altered and added to by successive Bishops of Winchester, but the only one who had left his name there in connection with work of the Mediæval period was Bishop Langton about the year 1500. Over the archway to the courtyard of the castle were to be seen the arms of the bishop, with the date underneath, 1495, which some persons made a mistake in reading, owing to the peculiar formation of the figures. Over the archway was a room called the exchequer chamber, in which was kept the manor rolls. The great hall, with the exception that the outer side was Norman, seemed to be of the date of Queen Mary, and it was a building of considerable merit, and the portico would have made a very pretty one.

Mr. E. Sloper next made a few remarks. He said that the common opinion was that King Ina built a castle there, but the Saxons never built castles at all. Neither in the speaker's opinion did Bishop Gifford build the castle. The founder of the building was Henri of Blois, Bishop of Winchester, in the year 1136.

Mr. Buckle and the party afterwards made a tour of the outer walls of the castle, which he briefly described.

The Municipal Buildings.

The next place visited was the council chamber of the Municipal Buildings, where the party were received by the Mayor, who showed the visitors the original charter of the borough granted by Charles I. It was lost at the time of the Restoration, but in the year 1677, at the instance of Bishop New, the charter was restored. In the year 1792, however, it was again lost, because the town failed to comply with the conditions on which the charter was granted. He (the Mayor) was given to understand that even in those days Taunton was not noted for unanimity among its councillors. As they knew, the charter was again restored, and it had been in existence for the past twenty-one years. The Mayor drew attention to the spacious mayoral chair, which, he said, was of Taunton manufacture. It was made from an old oak tree found in the bed of the river Tone, from which the chair was made by Mr. Steevens of that town. The Borough arms in needlework made from an altar cloth in St. Mary's Church, and presented by Dr. Cottle, were next shown, also an address from Taunton in America received in the year 1885. They sent an invitation for representatives of Taunton borough to be present to celebrate their 250th anniversary. It was found not convenient for any representative to go from the county town of Somerset, so the Town Council sent an address of congratulation, and that hanging in the council chamber was the reply received from Taunton in America. It was interesting to note that the frame was made out of timbers of the *Hawk*, which ship went out with the *Mayflower*, which took out the Puritan Fathers. The present council chamber was originally the dormitory of the old grammar school, and the hall they had met in at the opening of the proceedings was the schoolroom. He might mention that that was the first meeting which had been held in it since its restoration.

The Old White Hart Hotel.

A visit was next made to view the façade of the West Somerset Stores, which was originally the Old White Hart Hotel, where the notorious Judge Jeffreys lodged during the time of the "Bloody Assize" held in Taunton. The building, as most Tauntonians know, is in excellent preservation, and bears the date of 1578.

St. Mary's Church.

The beautiful old church of St. Mary Magdalene was next visited, and its fine proportions, elaborate decorations and interesting features were much admired. Taking up a position at the lectern, Mr. Buckle gave a description of the church. Beginning by stating that they would all agree that was an exceptionally fine church, Mr. Buckle went on to say that the plan was rather curious, because on either side of the nave was a narrow aisle, and then beyond that a very wide aisle. The natural assumption, therefore, was that the church originally consisted of the nave and a narrow aisle on one side, but that when it became desirable to enlarge the church it was decided to build other and larger aisles outside the original aisles. Speaking generally, St. Mary's Church might be called a Perpendicular church of two dates. The windows of the north aisle and three arches on the south were for the greater part of the Perpendicular period, and the clerestory was of the rich and elaborate style which developed at the beginning of the sixteenth century. The arcade on the north side was of a very much earlier and simpler style, and it had been the habit to describe that as the oldest part of the church. He did not believe that the arcade was genuine, that was to say, it was rebuilt during the Perpendicular period at one of the times when the church had a great enlargement, and that those pillars and arches were taken from some other part of the church and rebuilt as they saw them now. The bases and capitals, which belonged to a later period than the pillars, seemed to prove this. The earlier rebuilding of the church seemed to have included the whole of the north aisle, the lower part of the chancel and the eastern half of the south aisle. There was a great rebuilding at a subsequent period. On the right-hand side of the south porch there was a date—1508—and the greater portion of the church as it now stands was erected then—including the nave and clerestory and angel capitals, and the very handsome roof. And not only so, but the tower was rebuilt at the same time. In regard to the chancel, it was remarkable that there was no provision for a rood-screen, and there was no doubt that this part of the church was raised at the time of the great rebuilding. The east window was curious in regard to the arrangement of the tracery. There was a small window in the middle of the big window, the three centre lights and the tracery above forming in themselves a complete window and the other tracery filled in all around. The painted glass of the windows was mostly of fifteenth-century work, and in the centre light of the west window were the initials "R.B." with a merchant's mark underneath it. In the tower there were also four initials—"R.B." "A.S."—which had given rise to considerable conjecture as to what they meant. There were two persons of note living at that period—Richard Bere, abbot of Glastonbury, whose initials were to be found on St. Margaret's Hospital, just outside Taunton; and Sir Reginald Bray, about whom there was a tradition that he was architect to Henry VII., by whom it was thought by some the great towers of Somerset were built. But St. Margaret's Hospital was in the parish of West Monkton, and the Abbot of Glastonbury had nothing to do with Taunton, and it was extremely improbable that a great soldier like Sir Reginald Bray was also a great architect. He (Mr. Buckle) thought they might put down the initials to two benefactors, and the shield with the merchant's mark made it clear that "R. B." was a merchant of Taunton. On either side of the western entrance were fonts for holy water, and in the spandrels over the doorway were two elaborate pieces of carving which, however, had been very much restored. The subject of the one appeared to be the miracle of St. Gregory's mass and the other represented the appearance of our Lord to Mary Magdalene in the Garden of Gethsemane. A figure of the patron saint (St. Mary Magdalene) occupied a niche on the ground-floor in one of the north side columns. As to the tower it was one of the grandest in the county. It was 131 feet high and the pinnacles 32 feet, making a total of 163 feet high. It was covered with elaborate carving from the bottom right up to the top. It was emphatically built in the Somersetshire style, and a vast amount of money and effort must have been spent upon it, but not with such complete success as they could wish. The upper portion of the tower was much more beautiful than the other portions, and perhaps on that account it was a pity that Hammet Street had been opened up so as to expose the whole of the tower to view. On the north wall of the church was a life-size figure of Robert Gray, the founder of the almshouses in East Street, and under it were the quaint lines beginning "Taunton bore him, London bred him."

The party then responded to the invitation of the vicar, Rev. Prebendary Askwith, M.A., to inspect the registers and old plate in the vestry. There were two old registers on view, the one belonging to Queen Elizabeth's reign, and the other used during the time of Monmouth's rebellion. A note in the latter records the fact that burials were interrupted during Monmouth's rebellion, and it was interesting to observe that Monmouth's followers were invariably called "rebels" in the registers. The holy vessels, which are still in regular use, consist of two silver gilt flagons presented in 1639, two silver gilt chalices given in 1630 and 1639, and a silver salver, with a Latin inscription surrounding an engraving of the castle. These vessels were after the landing of William, Prince of Orange, at Torbay, buried to preserve them from the hands of spoilers.

The party next proceeded to St. James's Church, passing on the way through St. Mary's vicarage grounds, where they had an opportunity of seeing the only remains that are left of the earthwork that was put up around Taunton during the siege.

St. James's Church.

The above church Mr. Buckle described as a very great contrast to that of St. Mary's. It was, however, a straightforward example of a Perpendicular church of about the fifteenth century. The nave and the aisles appeared to have been entirely rebuilt about that time, but the chancel was entirely modern. It was a type of church which was rather unusual in Somerset on account of the width between the columns and the wide open roof. The enormously wide arch at the east end of the arcade was a very remarkable feature, and the purpose presumably was to enable a larger number of people to see into the chancel. There was a very elaborate font under the tower, which, he was sorry to say, had been restored so that it was difficult to say what parts of the carving were original and what parts modern. It was octagonal in shape with three figures on each side, so that altogether there were twenty-four figures, including the twelve Apostles. Above the font they saw the fine vault of the tower. It was a singularly beautiful tower, and was almost identical with the one at Bishop's Lydeard, but the latter was in one sense more perfect because it had the original parapet and pinnacles on the top. The outline and general effect of the tower were remarkably beautiful, and deserved to be looked at from many points of view, particularly from the bridge over the Tone. In his opinion that tower was an infinitely greater work of art than the great tower of St. Mary Magdalene, although nothing like the same amount of money had been spent upon it.

The Priory Barn.

A move was next made to what is known as the Priory Barn, one of the old farm buildings belonging to the Priory which in olden times stood in that part of the town. Little or nothing of the original building remains, and in the one end two windows taken from the Priory itself have been inserted.

Mr. E. Sloper gave some particulars of the old Priory, from which it appears that it was founded in 1125, but he thought there must have been an earlier monastery at Taunton—that was, before the Norman Conquest. It had always been a puzzle to him where that monastery could have been situated. In the town there was a street called Paul Street, and further on there was a farm called Pool Farm, where Roman remains were to be seen on the west side of the farm building. That he regarded as the site of the earlier monastery, which was absorbed by the greater monasteries prior to the Conquest. It was not mentioned in Domesday, but it was alluded to in charters and especially mentioned in connection with rendering certain things to the king in the eleventh century. The word Pool in regard to Pool Farm was, he might add, a corruption of Paul.

Gray's Almshouses.

A visit was next paid to Gray's Almshouses in East Street, which were founded, as a tablet on the front records, in the year 1635, by Robert Gray, whose virtues are described on a tablet to his memory in St. Mary's Church. The quaint old rooms were inspected with interest and the chapel in particular attracted much attention. In the chapel is still preserved the old Bible printed in 1634, which was used at the foundation of the almshouses, and the various readers who are appointed by the inmates appear to have utilised the blank pages of the book for the purpose of recording their names. The inspection of this place concluded the tour for the day.

In the evening a meeting was held in the Castle Hall for the hearing of local papers and discussions. The President occupied the chair, and was supported by the Mayor and the Rev. F. W. Weaver.

The President read a paper on "Red Deer on the Quantocks." He said that the origin of his reading that paper was that in his last address as President at Bridgwater he was reported to have used these words:—"There was a general belief that, as on Exmoor, which had been a royal forest from time immemorial, so on the Quantocks red deer had been for centuries. These beautiful animals, however, were claimed to have been first turned out on the Quantocks by Mr. C. E. J. Esdaile's father, and this was confirmed by Lord Ebrington." He would now wish to withdraw Lord Ebrington's confirmation, which was given by him in his book on staghunting, because last winter he met him and asked him about this question, whereupon he told him that he (Mr. Stanley) had been his authority on the question of Mr. Esdaile turning the deer out. He (the President) had thought Lord Ebrington had independent knowledge of his own of what was in the documents belonging to the Esdaile family, but he was quite prepared to take the responsibility upon himself. The Rev. Mr. Greswell wrote a letter to the *Somerset County Gazette* on the subject, and seemed to have to a certain degree convinced the editing secretary of that Society.

The Rev. F. W. Weaver: I am not responsible for all I print.

The President, proceeding, said he was glad to find that the committee cordially agreed with his suggestion that he should read a paper on the red deer on the Quantocks. He hoped they would be very lenient to him, as a study of Domesday was one of the most fearful things that he had ever undergone, and it was very difficult to understand. Mr. Stanley then read his paper, which was of an interesting character, and in which he said there was no proof at all that in old days there were more deer on the Quantocks than in any other part of England, and also asserted that the forest laws did not apply to the Quantocks.

The Rev. F. W. Weaver read extracts from a paper by the Rev. W. Greswell, who was unable to attend, upon the same subject as that of the President's. Mr. Weaver remarked that the paper was very similar to Mr. Greswell's letter which had appeared in the *Somerset County Gazette*.

The Right Rev. Bishop Brownlow read a learned paper on the divisions of the bishoprics of Wessex.

The President cordially thanked Bishop Brownlow for his paper, and expressed pleasure that the late Bishop Clifford's successor showed such ability and willingness to assist them in their discussions.

Preb. Holmes made some remarks on the Bishop's paper, after which

The Rev. Mr. Richardson read a paper on St. Anne's Chapel, Brislington.

This closed the evening's proceedings.

(*To be continued.*)

AN EARLY BRITISH EARTHWORK.*

THE borderland between England and Wales presents the student of the early modes of warfare with a rich field for investigation. It affords examples of every conceivable mode of fortification adopted in past ages. This county, which it is the special business of the Caradoc and Severn Field Club to examine, is not the least interesting portion of the Welsh border. Military camps, both circular and quadrangular, crown the summit of hill and mountain in every direction; not an eminence of any importance, from the lofty Brown Clee, the Caradoc, the Stiperstones and the Wrekin, down to the humbler elevations of Nesscliff, Abery and Bayston Hill, is without some ancient earthwork. Then come the sites and remains of ruined castles of Saxon earls, mostly of small dimensions, and following these in the category are the great Norman and Mediæval structures such as Ludlow, Clun, Whittington and Shrewsbury; and, lastly, the numerous moated dwellings which thickly stud the whole county. In all these we have visible material records written on the face of the land pointing to the checkered history of the nation through British, Roman, Saxon, Danish and Norman times, as well as the troublous periods of later years. It is to some of us a matter of regret that hitherto these have not been carefully scheduled, photographed and described, as has been done in some other counties. Nor can I understand why those engaged in teaching do not take their pupils into the country and point out to them such remains as serve to illustrate some of the more important episodes of British history, just as geologists and botanists take their pupils into the fields and to the hills to study the rocks and plants as they occur in nature.

On this occasion we have come to inspect a very remarkable British earthwork, which has occupied the attention of our ablest historians, and about which much has been written. It is a striking example of a place chosen for its natural advantages, which, artificial work being added, formed an almost impregnable fortress in face of such means of assault as at the time of its occupation could be brought against it. When Julius Cæsar invaded Britain he tells us that envoys were sent to him from some of the tribes which sought peace, and the envoys informed him "that the town of Cassivellaunus was not far off, surrounded by woods and marshes and occupied by a large number of men and cattle. The Britons call by the name of town a place in the fastnesses of the woods surrounded by a mound and trench, and calculated to afford them a retreat and protection from hostile invasion." In the "Berth" we have just such a position as Cæsar describes. Among the several accounts of the "Berth" that our local historians have written, that of Hartshorn, in his "Salopia Antiqua," is the fullest and the best, and I cannot do better than give it you:—

The works at the "Berth" consist of two distinct fortresses, lying in a morass, but which are connected with each other by an artificially raised causeway, 150 yards long and 12 feet wide, formed with vast labour of stones. Though this traverses the bog at present on a level with it, yet it is distinctly marked by the yellowness of its herbage, notwithstanding all

* A paper read by Mr. W. Phillips at the excursion of the Carado and Severn Valley Field Club to the "Berth."

the drainage which the land has undergone. Besides this, there is another causeway that takes a sinuous line across the bog towards the higher ground at Marton. This was the road of general communication with the main land; the other was merely a passage of intercourse between the two camps. They are each of them built with stones, brought from a gravel pit a quarter of a mile distant.

The Upper Work occupies a circular eminence of three acres, and rises about 45 feet above the level of the land at its base. It is strengthened on three sides by a morass; upon the south, or fourth side, by a deep pool of water, covering eight acres. A concentric trench and vallum encircle the whole work; in some parts this is still tolerably perfect, chiefly so on the north side, but having been formed of stones according to the British method of construction, the greater portion of it is destroyed, and what remains is daily growing less conspicuous in consequence of the materials being used for draining the surrounding wet land. The fosse was at first as much as 10 feet wide. The crest of the vallum is at present about 20 feet above the level of the marsh. On the north north-east side are remains of the original entrance. The gorge or gangway is 7 feet wide. It had a tower on either side, or some erection which answered the same purpose, for there are two great heaps of stones still on the surface, notwithstanding the thousands of loads that my informant told me had been buried in the surrounding bog, or carried away to mend the neighbouring roads. The work of destruction was proceeding when I was on the spot, but happily it will take many years still to complete. A stream runs round this side of the work that cuts off the causeway from reaching to the very entrance. There is no doubt that this was intentional, and served the purpose of preventing all approach to the superior fortress, unless its inhabitants let down a plank or drawbridge to allow their friends to come over.

Proceeding along the Causeway for 225 yards we are stopped by a high, thick hedge, and obliged to make a little deviation from a straight line, so as to fall in with it again on the other side. Following it for 25 yards further, we enter the Inferior Work between two slightly elevated mounds, which formed the original gate of admission.

The interior fortress is of an elliptical form. It was defended by a morass on all sides, and even intersected by a ditch that was supplied with water to render all access to it still more difficult. The works on the side next the superior fortress are considerably higher than those in the other quarters. They are so faint and uncertain on the north side of the intersecting ditch that it is questionable whether this side of the entrenchment ever had any other defence than the morass, the treacherous nature of which, even now (1838), makes it troublesome to cross. It would have been a measure easily resorted to if the Britons, when attacked, had dammed up the two streams which now tend to drain the bog, and this would have at once converted each of these fastnesses into an island. Yet if they had confided in the natural advantages alone of their retreat, the protection afforded by the elevated situation of the superior work and the marshy ground around it would have rendered their position extremely formidable. In whatever way we look at these two fortifications, they cannot fail to strike us as most remarkable examples of castrametation for the age when they were constructed. They evince a degree of military knowledge that is highly curious and surprising, whilst they furnish us with a connecting link in the history of martial tactics that is well deserving the attention of the antiquary and the soldier.

This place has been regarded by some as the stronghold of the Welsh Prince Cynddylan, to which he retired from Shrewsbury before the face of the Saxon spoilers when they burnt that town, as they had previously burnt Uriconium. Relying upon a Welsh poet, Megaint, Owen and Blakeway believe that Cynddylan was slain at Withington beyond Haughmond Hill, and trusting to another Welsh poet, Llywarc-Hen, who writes, "The churches of Bassa are enriched this night, containing the departed remains of the pillar of battle," they go so far as to state "it is certain that he was interred at Baschurch." They then allude to the "Berth" in these words:—"It was in this spot as I (*sic*) conceive that Cynddylan, imitating his aboriginal forefathers, who, as we know from Cæsar, fortified themselves in woods and marshes, sought an asylum after his expulsion from Pengwern. Whether he was slain at Withington or Whittington, no reason can be assigned why he should be buried at Baschurch but that his residence was in its immediate vicinity. And it lends some force to this opinion, that Baschurch was in the reign of the Confessor part of the royal demesne of the Crown of England. It is natural to suppose that such demesne was in Mercia derived from the Mercian kings, and it is likely that Offa, in his conquest of western Shropshire, would retain in his own hands all the possessions of the native sovereigns of Powis. Thus the place is connected by no improbable links with the time of Cynddylan." ("History of Shropshire," i. page 8.) Other authorities do not agree with the views taken by these authors as to the date when Llywarc-Hen flourished, considering it to be much later, the names he employs to designate towns and rivers being such as were used by the Saxons. I will conclude these remarks by a quotation from the learned Eyton's "Antiquities of Shropshire," in which the latter view is clearly and briefly expressed:—

"Somewhat more than a mile to the north-east of Baschurch stands the 'Berth,' one of the most remarkable fortresses of a British era to be found in Shropshire or any other county. The existence of such a work has served to make Baschurch and its vicinage the supposed theatre of a tragic story, the merest outline of which contains an element of some suspicion. We are invited to believe that Cynddylan, Prince of Powis, retiring in the sixth century before the superior power of the Saxons, and having already abandoned his ancient dominion of Pengwern, stood at bay among the morasses of this district, and being slain in battle, was buried at Baschurch.

> The churches of Bassa afford a space this night
> To the offspring of Cyndrwyn,
> The grave-house of fair Cynddylan."

The theory which connects the "Berth" with the history and fate of Cynndylan I am not prepared to investigate, but the introduction of Baschurch into the above story is not, I hope, essential to its credibility. Bassa is a Saxon proper name. Baschurch cannot therefore have been founded till long after the era of Cynddylan, for Christianity and churches were unknown in Mercia till the middle of the seventh century.

I am afraid that the obvious result of the above argument goes to question either the antiquity of the era of or the authenticity of the poem assigned to Llywarc. The poem must be the work of a bard who might have known Cynddylan was buried near the place which in his (the bard's) time was called Baschurch; but who did not know that the church of Bassa was non-existent at the era of Cynddylan? (Eyton, x. 129.)

At the conclusion of the paper most of the party walked round the "Berth" while Mr. Phillips pointed out the details he had referred to. The approach to it was defended by a ditch surmounted by a fence of barbed wire, but a small breach in the defences was widened to admit of the passage of the advancing army, most of whom, even the ladies, passed through in safety. The return journey was completed before 8 P.M., thus terminating a most delightful excursion.

NATIONAL PORTRAIT GALLERY, EDINBURGH.

THREE additional niches on the façade of the Portrait Gallery, Queen Street, have been filled, to be followed soon, says the *Scotsman*, by three more. The first of those just placed is James I. of Scotland, called the Poet King. The attitude and accessories suggest the poet, while the robes and sword indicate a knightly personage. The statue gives an excellent realisation of the dual characteristics of the first of the Jameses. The second statue is that of Napier of Merchiston, the inventor of logarithms. It is the gift of the Actuarial Society, Mr. James Meikle having acted as secretary and Mr. Thomas Wallace as treasurer. The attitude of the figure is also suggestive of deep meditation befitting an inventor in so abstruse a department of science, and the costume is the picturesque long-sleeved, fur-lined mantle, doublet and trunk hose worn by men of learning of his time. Both of these statues are from the studio of Mr. D. W. Stevenson, R.S.A., who followed in the portrait of the king a likeness believed to be contemporary and authentic; while that of Napier was chiefly taken from the painting in the possession of Lord Napier of Ettrick. The third figure is that of Alexander III., an early and heroic defender of Scotland's rights. It is from the studio of Mr. W. Grant Stevenson, R.S.A., and, like the others, is 7 feet in height. The idea chosen by the sculptor is to present Alexander as replying to a messenger from the English king asking him to do homage for his crown and kingdom, in terms similar to those used by Wallace:—"To homage for my kingdom of Scotland no one has any right but God alone, nor do I hold it of any but God." The king is represented in the costume of the period, as shown in the State seal, standing firmly on the right leg, with the left advanced. The arms, crossing the body, grasp the sceptre which he means to retain, while the cloak, thrown back over the shoulders, assists in conveying the regal dignity desired. The three figures are admirable additions to the decorative statuary on this national building. Below the figures the corbels have been carved with appropriate coats of arms, and the Board of Manufactures have been experimenting to see the effect on the building of the names of the personages celebrated being emblazoned in gold on a band underneath them. Colour, it is understood, will also be employed in a like experiment on the coats of arms. The three statues just described have been placed in niches at the east end of the building—Napier in the angle turret, and adjoining him the figure of the poet Dunbar will shortly be erected.

TESSERÆ.

Roman Surveyors.

THE name mensores, measurers or surveyors, was given to various classes of persons whose occupation was the measurement of things. 1. It was applied to land surveyors who measured and defined the extent of fields, and appear to have been the same as the agrimensores. 2. To persons who measured in the Roman camps the space to be occupied by the tents. They must be distinguished from the metatores, who selected the place for a camp. 3. To a class of officers during the time of the empire who provided quarters for the soldiers in the towns through which they passed and where they made a temporary stay. They not only assigned to each soldier the house in which he was to be quartered, but also wrote the name of the occupant upon the door-post, and he who effaced or destroyed this name was punished as a *falsi reus*. 4. Mensor ædificiorum is sometimes applied to architects, or more especially to such architects as conducted the erection of public buildings, the plans of which had been drawn up by other architects. 5. Mensores frumentarii was the name of officers who had to measure the corn which was conveyed up the Tiber for the public granaries. They were stationed in the port near Ostia, and were employed under the præfectus annonæ. Their name is mentioned in various ancient inscriptions.

The Argei in Rome.

We learn from Livy that Numa consecrated places for the celebration of religious services, which were called by the pontifices "argei." Varro calls them the chapels of the argei, and says they were twenty-seven in number, distributed in the different districts of the city. We know but little of the particular uses to which they were applied, and that little is unimportant. Thus we are told that they were solemnly visited on the Liberalia, or festival of Bacchus; and also, that whenever the flamen dialis went to them he was to adhere to certain observances. They seem also to have been the depositaries of topographical records. There was a tradition that these argei were named from the chieftains who came with Hercules, the Argive, to Rome, and occupied the Capitoline, or as it was anciently called, Saturnian Hill. It is impossible to say what is the historical value or meaning of this legend; we may, however, notice its conformity with the statement that Rome was founded by the Pelasgians, with whom the name of Argos was connected. The name argei was also given to certain figures thrown into the Tiber from the Sublician Bridge on the Ides of May in every year. This was done by the pontifices, the vestals, the prætors and other citizens, after the performance of the customary sacrifices. The images were thirty in number, made of bulrushes, and in the form of men. Ovid makes various suppositions to account for the origin of this rite; we can only conjecture that it was a symbolical offering to propitiate the gods, and that the number was a representative either of the thirty patrician curæ at Rome, or perhaps of the thirty Latin townships.

Michel Angelo's Method.

On all occasions Michel Angelo avoided a multiplicity of objects and a multiplicity of parts. He knew, as a great critic has judiciously remarked, that in poetry and painting many little things do not make a great one; and he has, therefore, rejected all unnecessary subdivisions and unessential particularities; hence the bold swell and flow of his line, uninterrupted by useless breaks and petty inflections; hence the unencumbered breadth of his surfaces, on which the eye rests unfatigued and unperplexed by impertinent differences and trivial distinctions, and hence the fewness and largeness of the parts, both in respect to his figures and his compositions, at once so simple and so impressive. The same method obtains with him in the intellectual as in the practical parts of the art. In his manner of conceiving his subject and telling his story he equally avoids all petty and commonplace details of circumstances, ingenious artifices, unimportant shades of character, and merely curious varieties of expression, which arrest and distract the attention of the spectator and weaken the force of the general effect; essence, not individuality; sentiment, not incident; man, not men, are his objects; and, like the "Satan and Death" of Milton, he meditates no second stroke, but hastens, by one sure blow, to effect his purpose. As his profound knowledge of the human figure taught him what to reject, so it likewise taught and enabled him to mark the essential forms with unexampled force and precision; possessed himself, he instantly possesses the spectator with the complete idea of his object. As in the drawing of his figures there is more knowledge and precision, so in their actions and attitudes there is more vigour and unity than is seen in those of any other modern painter. By this is meant that the situation and turn of every limb is more correspondent with the whole, is more perfectly informed with the same mind and more exactly bears its part in the general feeling; and hence it is that, though Raphael often exceeds him the variety of his characters, the particular expressions of passions, and what may be called the dramatic effect of his pictures, yet in giving the appearance of thought, capacity and dignity he is altogether unrivalled and unapproached. This perfect unity or concurrence of every feature, joint and limb in the same feeling, united to the breadth and boldness of his style of drawing, is what constitutes the intellectual energy of his figures and gives them that air of inspiration and of belonging to a higher species of beings which Sir Joshua Reynolds notices with such admiration. Rapt and absorbed themselves, they instantly communicate the same sensations to the beholder, who, awe-struck whilst he gazes on them, dares not think them on a level and of the same rank with himself.

Turrets.

Turrets may be described as of two kinds, such as rise immediately from the ground, and those which are formed on the upper part of a building by being carried up loftier than the rest. Of the first-mentioned kind are staircase turrets, which are generally of very narrow proportions and with small windows. Turrets of this kind were frequently attached to the angle of a larger tower, in which case they usually rise above the latter in order to afford access to its platform roof, owing to which circumstance they serve to contrast with the bulkier mass and to produce greater play of outline. Thornbury Castle, Gloucestershire, affords a fine example of an octagon tower and a turret of the same plan thus combined. Gatehouse turrets, or such as flank a gateway, belong to the same class. Turrets which show themselves only on the upper part of a building are either merely carried up higher than the general line of the roof or parapet, or else spring out so as to project and overhang the wall, on which they are supported by corbelling, &c., and in such cases are sometimes distinguished by the name of bartisans, or bartizan turrets. In the ancient Domestic architecture of both France and Scotland circular towers and turrets with conical roofs are frequent and characteristic features, and sometimes are so numerous that the whole structure seems to be composed of a cluster of them. Nearly the same may be said of some examples of our Elizabethan style, where groups of turrets, pinnacles and chimneys produce great picturesqueness of outline. Vanbrugh attempted, not without success, to engraft the same character upon the style he practised, grouping his chimneys together in the form of turrets on the roof, and making them very important, if not exactly the principal features in his compositions.

St. Evasio, Monteferrato.

The church of St. Evasio, at Castle Monteferrato, was founded in 741 by King Luitprand, and consecrated as a cathedral by Pope Pascal II. in 1107. The atrium is full of architectural significance. The material is brick with an irregularly disposed facing of stone; the façade presents a thin coating of stone attached to the wall of brick. The object which subsequently became so paramount in Lombardy, that two strong columns should lean against the outer wall, corresponding to the division of the three naves within, is here apparent. The covering of the atrium forms so weighty a superstructure, that it was deemed necessary to secure the façade by a pair of heavy buttresses. This atrium is (after the principle applied at the Constantinian cathedral of Trèves) covered by means of arches which support a wall, with the flat roof above. The arches are very strong, and those ranged along the length of the building have a span of 16 metres, and rest on colossal sockets. Those carried transversely could not have so great a span, but as they must have had the same height as the rest the architect formed them of a single limb, which, ascending from the eastern side, is supported with its apex against the wall of the façade. Of the two main supporters of these arches one, with four pilasters leaning against it, at the heads of which the Corinthian and cubiform capitals are blended, forms a column. The pilasters against the walls are treated in like manner. To this atrium follows the cathedral itself; the unity of both, as comprised in a single plan, is not to be mistaken. With five aisles, its perfectly fashioned vaults rest upon columns, the design of each of which describes a Greek cross. The form of the cross is not given to the whole; from the eastern wall two semicircular choirs project, giving a limit interiorly to the side-aisles; the nave (and this also has furnished a type to later edifices) breaks through this wall with a completely quadrate vaulted recess, and to this is added the semicircular niche. The fourth vault from the entrance, which is also the fourth from the apse, and thus may be called the heart of the entire edifice, is surmounted by a cupola whose length is greater than its breadth, at the angles of which are pilasters with rudely carved heads. The walls perforated by the windows bear the antique ornaments of foliage, shaped like hearts or arrows, &c., and from some of the columns, which Osten declares to be primæval, start forth the figures of fantastic monsters of the romantic period, among which are especially to be observed the griffins stinging each other with the serpentine and flowery tails in which they terminate.

Treatment of Single Figures and Groups.

When the picture consists of a single figure only, that figure must be contrasted in its limbs and drapery with great variety of lines; it should be as much as possible a composition of itself. It may be remarked that such a complete figure will never unite or make a part of a group, as, on the other hand, no figure of a well-conducted group will stand by itself. A composition where every figure is such as a single figure ought to be, and those likewise contrasted to each other, which is not uncommon in the works of young artists, produces such an assemblage of artifice and affectation as is in the highest degree unnatural and disgustful. There is another circumstance which, though not improper in single figures, ought never to be practised in historical pictures, that of representing any figure as looking out of the picture, that is, looking at the person who views the picture. This conduct in history gives an appearance to that figure of having no connection with the rest, and ought therefore never to be practised except in ludicrous subjects. It is not certain that the variety recommended in a single figure can with equal success be extended to colouring. The difficulty will be in diffusing the colours of the drapery of this single figure to other distant parts of the picture, for this is what harmony requires. This difficulty, however, seems to be evaded in the works of Titian, Vandyke and many others by dressing their single figures in black or white. Vandyke, in the famous portrait of Cardinal Bentivoglio, was confined in his dress to crimson velvet and white linen; he has therefore made the curtain in the background of the same crimson colour, and the white is diffused by a letter which lies on the table, and a bunch of flowers is likewise introduced for the same purpose.

The Vatican.

The assemblage of buildings called by the name of the Vatican, and which extends in an oblong irregular mass north of St. Peter's as far as the town walls, consists mainly of (1) the Papal palace, (2) the court and garden of Belvedere, (3) the library, (4) the museum. The Papal palace contains, among other remarkable objects, the Sistine and Pauline chapels, painted by Michel Angelo. The Sistine Chapel contains the painting of the *Last Judgment*; the four "stanze," or apartments, painted by Raphael; and the "logge," or open galleries, painted by Raphael's pupils under his direction. There are numerous other apartments, with paintings and other objects worthy of notice, which are described in the guide-books. The principal staircase, made by Bernini, is a splendid work of art. The Vatican is said to contain altogether eight great staircases, more than twenty courts, twelve great halls, and several thousand apartments large and small. A corridor, about 1,000 feet long, joins the Papal palace to the building called Belvedere, which serves as a museum. About half-way up this corridor is the entrance to the Vatican library, which was built by the architect Fontana under Sixtus V. Pope Nicholas V. was the founder of the Vatican library, which has been increased by many popes. The libraries of the Duke of Urbino, of the Elector Palatine, of Christina of Sweden, of the family Ottoboni, and others, have been added to it. It contains 80,000 printed volumes and 24,000 MSS., of which 5,000 are in Greek, 16,000 in Latin and 3,000 in the Oriental languages. Partial catalogues of this great store of learning have been published by Assemani, Marini, Mai and other librarians. The museum or collection of works of art, mostly of ancient sculpture, was begun by Clement XIII. and Clement XIV., and greatly increased by Pius VI., who was a man of taste, and who gave it the name of "Museo Pio-Clementino." It was illustrated by Gio. Batta Visconti and his son Ennio L. Visconti, in 7 vols. folio, with plates, Rome 1782. Pius VII., during his troubled pontificate, began a new collection, to which has been given the name of Museo Chiaramonti. The two together, which are distributed along the court, garden and palace of Belvedere, constitute the richest museum in Europe. Another and more extensive garden belonging to the Pope is annexed to the Vatican palace, and extends along the brow of the hill.

Arcades.

Although not so magnificent as colonnades, arcades are of extraordinary beauty when well contrived; they afford shade from the sun and shelter from the rain, and are therefore to be commended for their utility as well as their beauty. The piers of arcades may be decorated with columns, pilasters, niches and apertures of different forms. The arch itself may be turned either with rock-work or plain rustic arch stones or voussoirs, or with an archivolt properly moulded. The key-stone is generally carved in the form of a console, or sculptured with some head or the like. The archivolt springs from an impost or platband, or sometimes from columns, but this is not to be practised except in cases of the most urgent nature, for it makes neither substantial nor beautiful work. In arches that are of large dimensions the keystone should never be omitted; its carving, however, may be dispensed with if expense be an object. When the piers are decorated with disengaged columns the entablature must break round over the columns, and the columns, whether engaged or not, should stand either on a pedestal or high plinth, by which means they will not only be kept dry but their bases will likewise be protected from accidental damage. Arches must always rise from an impost or a platband, and if there be no keystone to the archivolt its summit should be kept down from the underside of the architrave of the accompanying order at least half the distance that it would be were a keystone employed, in order that the disagreeable appearance of the acute angle which it would otherwise form with the architrave may be avoided. The height of arches to the underside of their crowns should not exceed twice their clear width, nor should it be much less. The piers not less than one-third the breadth of the arch, nor more than two-thirds; but the piers at the angles should be wider than the other piers by one-half or one-fourth at least.

GENERAL.

The Old West Gate at Southampton has been restored and is to be used as a museum.

Mr. Percy Adams has prepared plans for new infirmary buildings in connection with the Dorking Workhouse.

Mr. Roberts, who was for several years borough surveyor of Oswestry, has resigned his office on his appointment as engineer of Cape Town.

Plans have been submitted by four local architects to the Smethwick Technical Education Board for the new technical schools in Crockett's Lane.

The Hon. John Macgregor has presented a cheque for 500*l.* as a contribution to the fund that is being raised for the endowment of a Chair of Forestry in the University of Edinburgh.

The Site of the monastery of the Grey friars at Winchester, which has since the Reformation been used as a field or a market garden, is now being utilised for building private houses.

The Local Government Board have sanctioned the borrowing of 100,000*l.* by the Liverpool Corporation, to be expended on the extension of the museum and new technical schools.

Sir David Gamble has presented to the town of St. Helens a marble bust of the Queen by Mr. Onslow Ford, R.A., being a replica of the bust which had received the personal approval of Her Majesty.

Dr. R. Traquair, of Edinburgh University, having been appointed Swiney Lecturer for this year by the trustees of the British Museum, he will deliver a course of lectures during October in the theatre of the South Kensington Museum on the Palæontology of Great Britain.

Mr. Alex. Cullen has designed the plans for the Young Men's Institute which is to be erected in Motherwell, N.B., at a cost of 4,000*l.*

The Trustees of the National Portrait Gallery have received from the Hon. John Collier a portrait of the late Professor Thomas H. Huxley, F.R.S., a full-size replica of the well-known portrait painted by Mr. Collier in 1883. This portrait has been painted by Mr. Collier especially for presentation to the nation.

An Exhibition of some of the French pictures lately seen in the Guildhall will shortly be opened in the Birmingham Art Gallery. Among them are Meissonier's *Friedland*, 1807, Benjamin Constant's *Pastime of the Kalife*, Jules Breton's *First Communion*, and others by Rosa Bonheur, J. L. Gérôme, Corot, Daubigny, Bastien-Lepage, Bouguereau, Delaroche, Isabey, Diaz, Courbet, Courtois and Harpignies.

An Exhibition of Pictures is to be held in the rooms of the Public Library, Ayr, during the coming winter. An influential committee of management has been appointed, with the Right Hon. the Earl of Eglinton and Winton as honorary president, and Mr. C. L. Orr-Ewing, M.P., as hon. vice-president. The proposed date of opening is December 6. Mr. W. G. Stevenson, R.S.A., and Mr. Wm. Young, R.S.W., have consented to hang the pictures.

The Liverpool School Board are about to erect schools in Boaler Street and Lawrence Road. The following local architects have been invited to submit designs:—*Boaler Street School*—Mr. G. Bradbury, Messrs. C. O. Ellison & Son, Messrs. H. & A. P. Fry, Mr. H. Hartley and Mr. C. Wise. *Lawrence Road School*—Mr. C. E. Deacon, Messrs. F. & G. Holme, Mr. E. Kirby, Messrs. T. Mellard Reade & Son and Mr. W. E. Willink. The clerk to the board is to act as adjudicator in the competition.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

CONTRACTS OPEN.

ALDERSHOT.—Sept. 16.—For erection of two shops, &c., Station Road, Aldershot, for Mr. R. S. Blades. Messrs. Friend & Lloyd, architects, Aldershot.

BARNSTAPLE.—Sept. 12.—For erection of a shop and residence in Boutport Street, Barnstaple. Mr. Fred. W. Petter, architect, Barnstaple.

BATH.—Sept. 12.—For repairs to 33 Paragon. Mr. Charles E. Davis, city architect, Guildhall, Bath.

BELFAST.—Sept. 14.—For erection of new church at Mansfield Street, Belfast. Mr. W. H. Stephens, architect, Donegall Square North, Belfast.

BLACKBURN.—Sept. 12.—For alterations at the slaughter-houses, for the health committee. Mr. William Stubbs, borough engineer, Municipal Offices.

BLAYDON-ON-TYNE.—Sept. 22.—For erection of public offices and technical school at Blaydon, for Urban District Council. Mr. T. C. Nicholson, architect, Blaydon-on-Tyne.

BRADFORD.—Sept. 22.—For erection of a warehouse, stabling for 29 horses, loose boxes, horsekeeper's house, &c., in Preston Street. Messrs. Fairbank & Wall, architects, Craven Bank Chambers, Bradford.

BRAINTREE.—Sept. 17.—For erection and completion of hospital and attendant's house, &c., on the Cressing Road, for the Braintree Joint Hospital Board. Mr. H. H. Nankivell, surveyor.

BRIDLINGTON QUAY.—Sept. 15.—For erection of dwelling-house and shop, west side Manor Street. Mr. J. Earnshaw, architect, Wellington Road, Bridlington Quay.

CARDIFF.—Sept. 12.—For erection of three new pavilions, lodge and contingent works at the sanatorium, for the Corporation. Mr. W. Harpur, borough engineer.

CHEPSTOW.—Sept. 26.—For rebuilding the George Hotel, Chepstow. Messrs. Veall & Sant, architects, Cardiff.

CHOLSEY.—Oct. 20.—For additions to the Berkshire Lunatic Asylum at Cholsey, near Wallingford. Mr. George T. Hine, architect, 35 Parliament Street, Westminster.

CUMBERLAND.—For reslating and lathing of a large mill at Egremont. The Wyndham Mining Company, Limited, Egremont.

DARTFORD.—For building 50 cottage dwellings near Dartford; bricks on the estate, also sand and ballast. Greenhithe Brick and Land Company, Limited, Southampton Row, W.C.

DEWSBURY.—Sept. 12.—For various fittings, counters cases, &c., required for fitting up the drapery and millinery departments, for the Dewsbury Pioneers' Industrial Society, Limited. Messrs. Holtom & Fox, architects, Dewsbury.

DEWSBURY.—For taking-down and rebuilding of St. Paulinus's schools, Dawgreen. Mr. Edward Simpson, architect, 12 Cunliffe Terrace, Manningham, Bradford.

DOVER.—Sept. 13.—For erection of workshop, &c., adjoining car shed at Maxton. Mr. Henry E. Stilgoe, Town Hall, Dover.

DUNGARVAN.—Sept. 17.—For providing baths with hot and cold water supply and water-closets attached, for the infirmary of the workhouse.

ELECTRIC NOTES.

ST. MARTIN'S CHURCH, Birmingham, is to be lighted by electricity. The tender of the Walsall Electrical Company, amounting to 430*l.*, has been accepted for the work.

THE electric lighting committee of the Edinburgh Town Council, in consequence of the greatly increased private demands for the light, have placed their estimate of revenue for the year at 54,000*l.* instead of 51,000*l.*

AN installation of the electric light has been fitted up by the Brush Company at Bo'ness Docks, and on Thursday night a number of the lamps were lighted for the first time. There are twenty lamps altogether at the harbour and docks, sixteen of them being arc lamps of 2,000 candle-power.

THE Aberystwyth Town Council have confirmed an agreement entered into with the Aberystwyth and Chiswick Electricity Supply for a period of two years, beginning on October 1 next, for the supply of electric current and maintenance of the present twenty-eight arc lights at the rate of 17*l.* 17*s.* per annum.

THE Local Government Board have sanctioned the borrowing of 33,000*l.* by the Salford Corporation for electric lighting purposes. Of the sum named 23,000*l.* is for the establishment of three battery sub-stations, and 10,000*l.* for the land for new generating stations. Approval is also given of the use of the basement of the Pendleton Town Hall and the subways around the women's second-class baths at Broughton for the purposes of the Salford Electric Lighting Order, 1890.

IN accordance with a recent decision of the Urban District Council, advertisements are to be at once issued for plans for a combined scheme of electric lighting and dust destruction for Maidstone. The idea of the committee who have the matter in hand is to use a portion of the Lock Meadows as a site for the electric lighting station and dust destructor, and it is proposed to erect stables, &c., for the District Council's horses and appliances on the same spot. It is considered that ample room will be left in the meadows for market and fair purposes.

THE work of lighting Balmoral Castle by electricity has been completed, says the *World*, and when the Queen arrived there were 600 lamps in use. This is a costly improvement, but the introduction of the electric light will be a great advantage, as the illumination by gas of the hall and corridors has usually been very dim, and has made the rooms unpleasantly hot and stuffy. The ballroom has always been like a Turkish bath after it has been lighted up for an hour or two, but in future there will be an incomparably brighter light with a cool atmosphere.

AT a meeting of the Denton District Council on Monday a letter was read from the Ashton-under-Lyne Corporation asking if, in the event of their deciding to promote a Bill in Parliament authorising them to supply electricity outside the borough, the Denton Council would at the same time apply for the usual provisional order under the Electric Lighting Act,

and, on the necessary powers being obtained, if they would be willing to enter into an arrangement for being supplied with electricity by the Ashton Corporation. The clerk was instructed to communicate with the Ashton Corporation as to their terms, and also with the Levenshulme Council with regard to the report recently made to them on the question of lighting their district by electricity.

THE electrical engineer to the Birkenhead Corporation (Mr. William Bates) recently drew attention to the lack of reserve power at the central electrical generating station, and was requested by the electrical committee to prepare a report on the plant thereat and as to further extensions which may be necessary. In the report since presented he suggests that tenders for the supply and erection of a further 150 unit steam dynamo should be asked for at the earliest possible date. As to the proposed extension, provision is made to meet all demands for the next two years at a cost of 13,343*l.* A list of thirty-two streets is given for the laying of distributing mains, and it is recommended that provision should be made for service cables, &c., for 150 fresh consumers. The borrowing powers of the Corporation for electricity supply are 41,500*l.* At present there is an excess over that authorised outlay on the cost of the existing works of 1,512*l.* 2*s.* 9*d.* In order to cover this excess and carry out the proposed extension, the committee have resolved to apply to the Local Government Board for power to borrow a sum of 15,000*l.*

VARIETIES.

AN infirmary is to be erected in Alcester at a cost of 5,900*l.*

THE Earl of Derby has presented the site required for the new schools at Haselmere.

A NEW bridge is to be erected across the Buckie Burn at a cost of 1,650*l.*, from plans by Mr. Barron, of Aberdeen.

THE Victorian Government will shortly be coming on the English market for large contracts for rails and fish plates.

PROFESSOR H. ADAMS has issued a syllabus of the comprehensive course of instruction in the engineering department of the City Polytechnic.

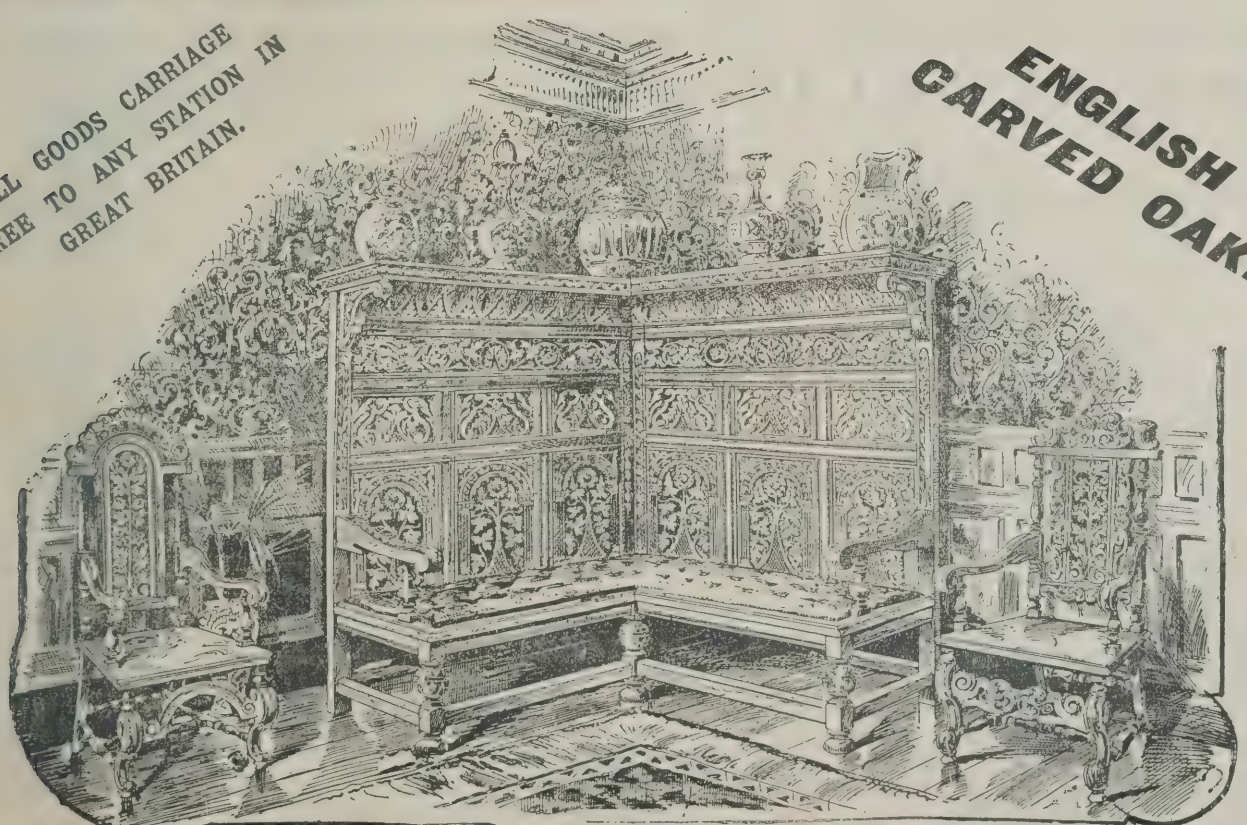
THE fire loss of the United States during the year 1897 amounted to 116,354,574 dols., of which the part covered by insurance was 66,722,145 dols.

THE Plasterers' Trade Union at the end of September have decided to give notice that unless the present wage of 10*d.* per hour is increased by 1*d.* the usual means will be resorted to.

A DEPUTATION of the Liverpool library, museum and arts committee will visit the general hospital at Birmingham to inspect the system of ventilation and heating adopted throughout that building.

A STERILISING apparatus has been brought out in New York in order to prevent the spread of disease by means of library books. It consists of a double-walled box of iron, in which are shelves for the reception of the books.

THE valuation returns of the National Provident Institution up to November, 1897, have been issued. The figures are more convincing than words about the stability and security of an office which insures at economical rates and is generous in its bonuses.



AS slow progress is being made with the construction of the new road round the Castle Hill, Scarborough, the sub-committee have passed a resolution regretting any unnecessary delay on the part of the contractors in not expediting the work, and calling upon them to make the necessary arrangements for commencing operations at the south or east pier end without delay.

A LETTER was read at the meeting of the Stafford School Board on Monday from the Education Department approving of the site for the erection of an infants' school in North Street for 150 children. The architect of the Board was instructed to prepare plans and specifications for the new school, as well as for an addition to the present Board school for 200 children.

THE people of Holland are now in a state of happiness which they are not afraid to display, and there is consequently more satisfaction to be derived from a visit to that country than is usual, although Holland can never fail to be interesting. The Great Eastern Railway Company have made arrangements which will economise the time of tourists and enable much to be seen at a very moderate expense.

THE Cabot Tower, Bristol, was opened on Tuesday by Lord Dufferin. The tower, which is 100 feet high, is divided into two stages, each relieved by an ornamental balcony, whilst above rises an octagon spire of 30 feet, surmounted by a globe and figure symbolical of peace. In the panels upon the four sides of the base are appropriate sculptured designs, and also tablets bearing suitable inscriptions.

A SITE for a new parish church at Rugeley has been selected. The present church, which was consecrated in 1821, is situated at the extreme end of the ecclesiastical parish, and is far removed from the centre of population. It is an incommodious building, the interior is disfigured by heavy galleries, and, in the opinion of architectural experts, it is not possible to reconstruct the building. The new site is situated near the Town Hall, and, while being in closer touch with the resident population, is also conveniently near to the Vicarage, the burial grounds and the schools.

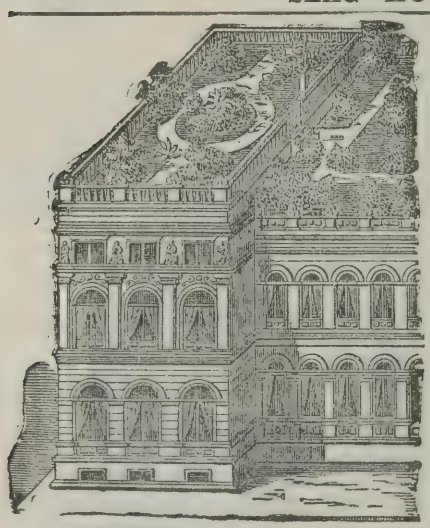
A PROJECT is in course of realisation at Fillongley, Warwickshire, which merits commendation. Cottage homes are in course of erection which are intended for aged local Methodist preachers who are unable to work and have no income. The trust deed confers the right of nomination for the cottage homes on each donor of 100*l.*, and any aged or necessitous local preacher's widow in either of the Methodist bodies is eligible for the occupation of a cottage and garden rent free for life. The number of cottages to be erected at Fillongley is seven, and the cost is estimated at 1,160*l.*

THE Charity Commissioners have just issued their scheme for the future administration of Lady Lumley's Charity (Thornton Dale and elsewhere), and the Grammar School (Pickering). These foundations are to be administered as one, by a governing body under the name of Lady Lumley's Grammar School Foundation. A central school is to be provided on the Thornton side of the town of Pickering, suitable for not less than forty day-scholars and 20 boarders, and there are to be fourteen foundation scholarships awarded to boys resident in Sinnington, Thornton Dale and Pickering.

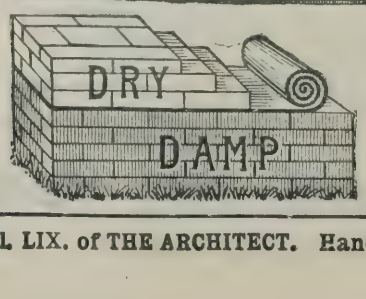
A RAILWAY viaduct, the most gigantic hitherto attempted in India, has been sanctioned, at a height of 300 feet, and stretching for 2,000 feet over the Gahtik gorge on the Mandalay-Kunlou line. Mr. Sykes, who took a prominent part in the erection of the Forth Bridge, and is at present Under-Secretary in the Public Works Department of the Government of India, is likely to superintend the building of this great steel viaduct. The Burmah Railway Company have been authorised by the Secretary of State to construct these two important branch lines—from Meiktila station for 57 miles to Mymingiyan, and from Sagaing station 74½ miles by Monywa to Alon, with a river siding to Mynima.

ACCORDING to the United States Consul at Zurich a new artificial stone or moss has recently made its appearance on the builders' technical market, called papyristite, on account of the ingredients entering into its composition, principal among which is purified paper-pulp obtained from waste-paper. The material is the invention of F. Gehre, a civil engineer of Zurich. It can be used in various ways, but is specially intended to serve as a solid, impermeable and jointless roof or floor, which, when once laid, will present a smooth surface, as if made in one continuous layer. This new material, it is said, is a non-conductor of heat, cold or sound, and, although as hard as stone, has a soft linoleum-like feeling to the foot, and is noiseless.

BUILDING AND BUILDERS.



MR. S. E. SMITH, of the firm of Messrs. Smith & Tweedale, architects, Leeds, has given his award in the dispute between Alderman Sherwood, the proprietor of the new Opera House and Theatre at Wakefield, and Messrs. F. W. Denholm & Co., builders and contractors, with reference to the erection of the new building. Mr. Smith finds that after making due allowance for Alderman Sherwood's claim against Messrs. Denholm & Company, there is 260*l.* 5*s.* due to that firm, and he directs Alderman Sherwood to pay that amount, and also the costs incidental to the reference and award.



A NEW building for the Royal Caledonian Asylum is to be erected at Bushey. The existing building in the Caledonian Road has been in use since 1828.

THE Duke of Westminster has given instructions for the alteration and enlargement of the Halkyn National school at an estimated cost of upwards of 1,000*l.* The Duke is also erecting a complete set of new school buildings at Rhesycae, a village also on his estate, to replace the present buildings. The contractor for both schools is Mr. A. B. Lloyd, builder, Flint; and the architects are Messrs. Douglas & Minshull, Abbey Square, Chester.

THE remains of Mr. A. Fuller James, a member of a firm of contractors who have carried out many large works at Grimsby and Cleethorpes, were interred in Highgate Cemetery on the 2nd inst.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

TRADE NOTES.

A PUBLIC meeting will be held in the Mayor's Parlour, Manchester, on the 19th inst., at which the Lord Mayor will distribute the prizes, certificates and bronze medal of the Plumbers' Company awarded in connection with the recent exhibition of plumbers' work at Manchester. The meeting will be a large and influential one, and several prominent men are expected to be present. The programme will include a lecture on "The Registration of Plumbers and Domestic Sanitation" by Dr. Mansel-Howe of London.

A LARGE clock with four illuminated dials and striking the hours has just been erected in the Market Hall tower at Towyn, Wales, by Messrs. John Smith & Sons, Midland Clock Works, Derby.

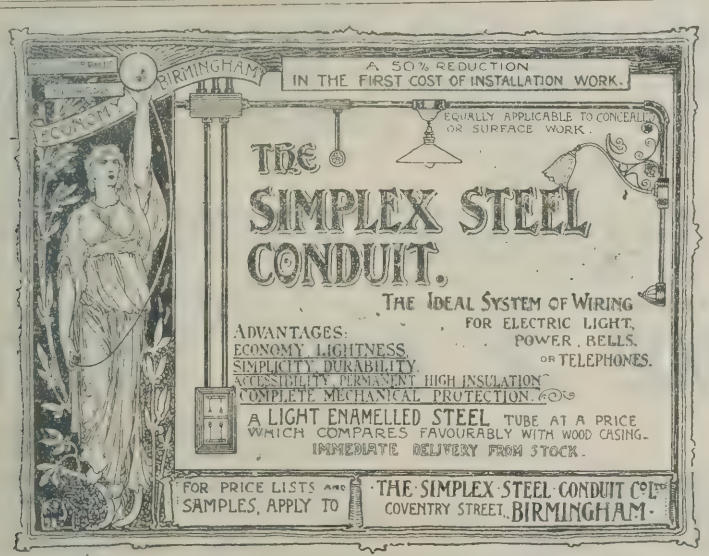
MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied some more of their patent double-fronted Manchester stoves with descending smoke flues to the new small-pox hospital, Dagenham.

THE BRISTOL DOCKS.*

APART from all the other considerations which so favourably affect this Congress, I think, so far as Section G is concerned, that we are fortunate in meeting in this ancient city, which has so much of special interest for engineers and for others interested in applied science.

I propose, therefore, to say a few introductory words about Bristol and its neighbourhood from the point of view of this section of the Association, but it is far from my intention to either criticise the past work of the Corporation in relation to their dock enterprises or to volunteer advice to them with respect to possible works of improvement.

Bristol is at this moment of great commercial importance, as indicated by the value of its imports and exports, and occupied an even more important relative position among British ports at a time when the ports of Liverpool, Glasgow, Cardiff, or Southampton were almost or altogether undeveloped. So far as Customs revenue is concerned Bristol now stands third, and in regard to the gross value of her seaborne trade she is thirteenth among ports of the United Kingdom.



It is unnecessary, and it would be foreign to the objects of Section G, to attempt to trace the economic reasons which caused the long-continued importance of Bristol, or to account for the rapid growth of other ports more or less competitive with it. All such causes are to be found, at least to a great extent, in considerations apart from the merely physical characteristics of the sea, river or land at the various sites, as, for example, in propinquity to markets or centres of production, in situation relatively to population or to means of distribution, in individual or collective enterprise, in enlightened or unenlightened administration.

These circumstances have, in truth, at least as much if not more influence in determining the history and prosperity of ports than what are termed natural advantages of respective sites, by which I mean such matters as protection from winds and currents, depth of water in the port itself and in its approaches from the sea, the possession of soil adapted to the foundations of docks or quays, and ready access to suitable materials for cheap and efficient construction.

While recognising to the full the great advantages of such physical endowments in the development of a great port, one cannot but remember that they form only part of the problem, and that the business of engineers is to modify and direct the great forces and characteristics of nature for the use and convenience of mankind. We have, in fact, to make the best of a locality which may or may not be promising in the first instance, and history shows us that there are few places which are hopeless for our purposes. Thus while on the one hand we see many harbours in this country which inherit from nature every feature to be desired for the establishment of a port, but which remain useless for that object, so, on the other hand, we find many of the great centres of trade established in situations which possessed no such advantages, and where almost everything has had to be supplied by painful exertion and great expenditure.

As examples of these facts I may point to the remarkable progress of many commercial ports situated in localities which were originally the reverse of promising from an engineering point of view—to Glasgow, where 26 millions sterling in value of exports and imports are annually dealt with in ships of the largest draught, though it is placed on a river which only fifty years ago was nearly dry at low water for a distance of 10 miles below the present docks—to Newcastle, with a present

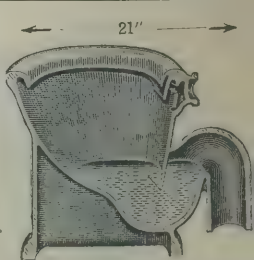
trade of 13½ millions sterling, which within the memory of this generation was approached by a shallow river, entering a much exposed part of the North Sea over a dangerous sand bar. Sixty years ago the Tyne could only receive (and that only at high water) a small class of coasting vessels, whereas it is now navigable for deep-draughted vessels for a distance of 13 miles from the sea. The breakwaters also at Tynemouth, which have been constructed under great difficulties on a coast without a single natural encouraging characteristic, not only make a valuable harbour of refuge, but have, practically speaking, removed the external bar.

In a similar way, as evidence of the truth of my proposition, I might point to a multitude of other instances—to the great docks of Buenos Ayres, which city, when I knew it twenty years ago, could not be approached within 7 or 8 miles by sea-going ships of 15 or 16 feet draught; to Calcutta, dependent on the dangerous navigation of the Hooghly, including the dreaded James and Mary shoals; to the creation of the port of Manchester, 45 miles from the sea, approached by a tide-locked canal which has cost 13 or 14 millions of money in its construction; to the great recent developments of Rouen, Dunkirk, Antwerp and Amsterdam; to the improvements of the Danube and the Mississippi. In all of these cases the natural characteristics of the localities were quite unsuited to the requirements of an advancing trade in modern vessels, but the inexorable demands of commercial shipping have created the supply, at the hands of engineers, of improvements and modifications of nature, which are so large and important that, to an unprofessional eye, they might now almost appear, at least in some of the cases which I have mentioned, to be physical characteristics of the locality.

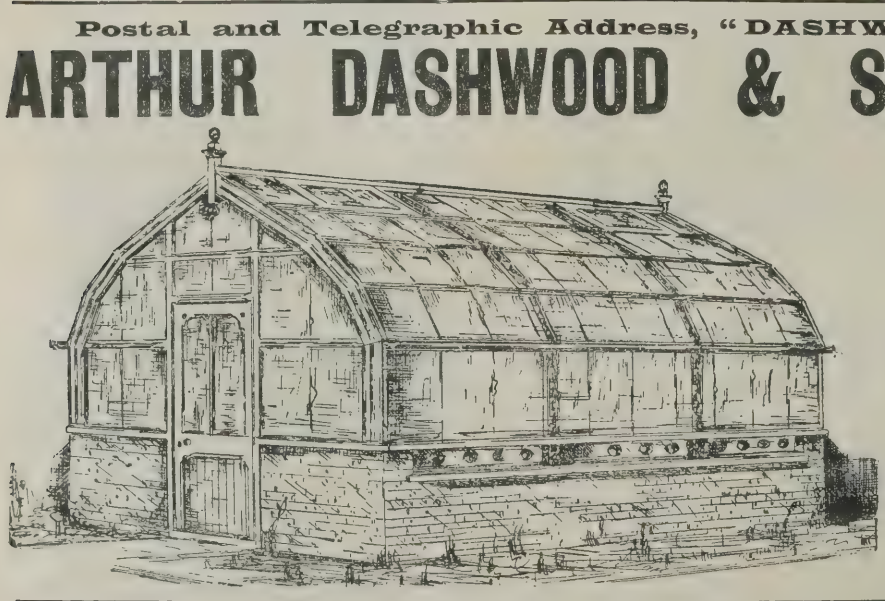
I think that we may safely say that trade will produce the required accommodation, and that accommodation in itself will not create or attract trade.



Bristol is a case in point, and it is interesting to us at this meeting to note, however briefly, some of the important works which have altered and are altering its capacity as a port. At the end of last century Bristol and its capabilities were, as they have been almost ever since, the battlefield of civil engineers, and we know that reports and projects were made by most of the men who were then recognised as authorities. The diversion of the river Avon and the construction of the floating harbour of Bristol, which were carried out under the advice of William Jessop in the years from 1804 to 1809, were boldly conceived and ably executed. The result of the diversion of the Avon by means of what is still known as the new cut enabled the old course of the river to be made into a floating harbour of about 71 acres, of which 57 acres are available for vessels of considerable size. The total cost seems to have been about 600,000*l*. Though the greatest draught of water in the floating harbour (some 20 feet), and the dimensions of the original locks (150 feet long and 36 feet wide) may appear to us at the close of the nineteenth century somewhat insignificant, they were, no doubt, up to the estimated requirements of that day, and I think we can recognise in Jessop's work the impress of a great mind.

The Cumberland Basin was deepened and improved, and the lock accommodation was increased by Brunel in 1850 by the construction of a lock, 350 feet long and 62 feet wide, and again by Howard in 1871, who made another lock, 350 fee long, 62 feet wide, with 23 feet of water at high water of neap tides. This is the present limitation of the access of shipping to the town docks, and though we realise its insufficiency for modern vessels, we can appreciate the energy of those who have gone before us, and who found the funds for or designed works which for so many years well fulfilled their purpose.

The approach to Bristol from the sea—that is to say, from King Road in the Bristol Channel—is certainly unpromising for large ships, and indeed, when contemplated at low water, appears not a little forbidding. Something has been done, and more is now in progress, towards straightening, deepening, buoying and lighting the tortuous course of the Avon below Bristol. More, no doubt, would have been undertaken in former years, if the great rise of tide in the river had not provided at spring tides a depth and width for navigation which were sufficient for practical purposes, until the size of modern ships imperatively demanded increased facilities of approach. I think it is a remarkable thing that vessels of 3,000 tons burden, 320 feet in length, and drawing 26 feet of water, succeed in reaching Bristol, and that the trade in the heart of the city continues to increase.



Those acquainted with the strong tides of the Avon, or with its bends, which do not exceed in places a radius of 800 feet, and, lastly, with what might be the consequences of a long vessel grounding in a channel which has only a bottom width of 100 feet, cannot but recognise the skill and nerve of the pilots in navigating large vessels from King Road to Bristol. This is done by night as well as by day, and so successfully that the rate of insurance for Bristol is no more than it is for Avonmouth or Portishead, the entrances of which

CASES FOR BINDING THE ARCHITECT.
Price Two Shillings.—Office: 175 Strand, London, W.C.

are in the Severn, or than for many ports situated on the open sea.

We have similar examples of what can be done by the systematic development of pilotage skill in the Hooghly, the River Plate, in the Yangtse Kiang, the Mississippi and other rivers where special men have been evolved, as it were, by the demand, and navigate with safety and success channels which are so full of dangers that they might well appear impracticable. Experience, indeed, shows us that, given a trade and a depth of water rendering access possible, ships will make their way to ports through all kinds of difficulties and with a wonderfully small margin of water under their keels, reminding one of the boast of the Mississippi captain that he could take his steamer wherever the channel was a little damp.

To return, however, to Bristol and the Avon; in spite of all efforts to keep pace with trading requirements, the time arrived, in 1868, for providing improved dock accommodation, which would avoid the navigation of the Avon, and at the same time afford deeper locks and more spacious quays than could be given in Bristol itself. The Avonmouth and Portishead docks were accordingly built between 1868 and 1878, and acquired by the Corporation in 1884. Both are fine works for their period; but even in their case the rapid development of modern shipping has occasioned a demand for enlargements of the facilities which they afford. Accordingly, a matter which is again agitating Bristol is still further dock accommodation, and there has been a sharp contention whether this should be effected by what is implied in the somewhat barbarous word "dockising" the Avon, or by new docks at King Road. Dockising implies the construction of a weir and locks at Avonmouth, so that the Avon would be impounded and make one sheet of water nearly six miles long to Bristol, the natural discharge of the river being provided for by outfall sluices, while the alternative of dockising the Avon is to be found in great additions to the docks either at Avonmouth or Portishead.

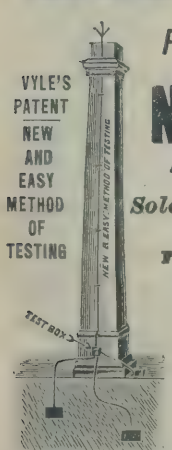
In the peaceful atmosphere of Section G I will not enter upon the various aspects of these antagonistic proposals, and will merely say that I have no doubt that in some way Bristol will keep ahead of what is wanted, and that I wish the city and the engineer who may carry out any of the ideas which may be eventually adopted every success and satisfaction in such important undertakings.

THE GRANVILLE THEATRE.

THIS new music-hall is proposed to be opened on Monday, September 19, 1898, and will be found to be one of the most unique buildings of its class in London. The site is an important corner one, being situated on the north side of the Broadway, Walham Green, with frontages to Jerdan Place and Vanston Place, and, although small, has been utilised by Mr. Frank Matcham, the architect, in a very careful and clever manner. There is not an inch of room wasted; staircases are found one over the other, saloons and retiring-rooms are placed in positions which do not occupy seating room, and yet are handy of access and of good proportions—in fact, every accommodation is provided, including manager's offices and good roomy dressing-rooms, well lighted and ventilated.

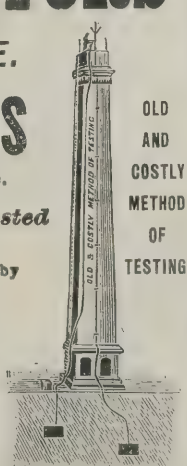
The whole of the ground floor will be carpeted and fitted with comfortably upholstered tip-up chairs. There is no pit, the shilling audience being supplied with a fine roomy balcony, and over this is a large gallery. The entrances and exits are admirably arranged. The holding capacity is calculated at nearly 1,500. Galleries are constructed without columns; a clear and uninterrupted view of the stage is obtained from all parts.

The elevation is a very imposing one, built of red brick and terra-cotta, the corner being very artistically treated with towers and minarets.



Over the entrances will be handsome iron and glass shelters, filled with painted glass and brilliantly lighted.

The entrances and vestibules are beautifully decorated with raised plaster enriched, the ceilings and walls being panelled out in Louis XVI. ornamentation. This decoration is carried along the walls of the open corridor at sides of stalls, and is finished in blue and gold, with figure paintings in panels, the whole having a most charming effect.



The design and modelling of the work has received great attention, and when the whole decorations are brilliantly illuminated with the electric light (special plant for which is about to be erected), and warmed with the rich copper colour draperies and velvet seats, a most beautiful effect will be obtained.

The greatest novelty in the building is its decorations. Mr. Matcham has introduced eburite faience ware for the whole of the interior embellishments; not only are the walls covered with this material but also the proscenium front, auditorium, ceiling, gallery and balcony fronts, which give a most charming result. It will save a great deal of labour and

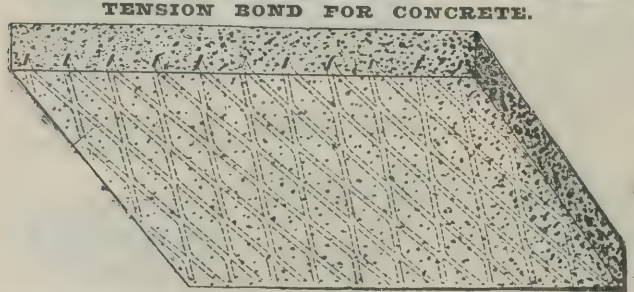
expense that otherwise would be necessary for the renewal of decorations and keeping clean, as by giving it a rub down periodically with a wet sponge it is always kept bright and clean.

The eburite faience is a special egg-shell glazed material which has been successfully used in other large schemes of decoration by Mr. Alfred Whitehead, of Leeds, the contractor for this work, who has now combined business with the Campbell Tile Company, and who are now carrying it on as Campbell, Whitehead & Co., of Leeds and Stoke-on-Trent.

SANITARY INSPECTORS' ASSOCIATION.

THE second meeting of the season was held on Saturday, the 3rd inst., at the Royal Institution, Liverpool, the president, Dr. Francis Vacher, in the chair. After the nominations of a number of gentlemen as members of the Association had been approved, the President delivered his inaugural address, the object of which was to convey a few useful hints on the preparation of annual reports. Dr. Vacher said it was because he believed in the inspector and his career, and because he knew that he had something to say about his work which the public would be the better for hearing, that the matter of the annual reports so much interested him. Proceeding to point out some defects and make some suggestions for improvement, he emphasised the need of a uniform plan in the preparation of reports, which would render them collectively accessible and form a very valuable assistance and guidance to the whole profession. Speaking of the need for precision in recording facts he said good reports consisted of exact facts, exact deductions and exact opinions. He urged the necessity of a little more care in drafting reports, and the importance of adhering closely to one's subject matter and avoiding "fine writing," or referring to Acts of Parliament after the manner of the lawyers. Another important precaution to be observed was to keep the report within reasonable limits as to length. If a report was to do any good it must be read, and if it was too long people would not read it. He also urged the necessity of more care in the revision of proofs, instancing some very comic errors which had crept into reports from time to time either through bad writing or the idiosyncrasies of the printer. On the motion of Dr. Carter, J.P., seconded by Mr. Mort, Dr. Vacher was heartily thanked for the useful paper. The meeting was attended by representatives from Liverpool, Manchester, St. Helens, Lymm, Crewe, Waterloo, &c.



TECHNICAL INSTITUTE, TAUNTON.

THE foundation-stone has been laid of a technical institute, on a site adjoining the municipal buildings in Taunton. The plans were prepared by Mr. C. H. Samson, of Taunton. The style is Elizabethan, and the entire frontage is about 76 feet. In its construction Westleigh stone with Ham Hill stone dressing will be used, and the building will adjoin the terrace of the municipal buildings. The elevation is 42 feet and the roofing will be of red tiles. The building will consist of two storeys, and on the ground floor will be an electrical laboratory 30 feet by 19 in dimension, and the physical laboratory 30 feet by 16, together with a workshop, caretaker's room and entrance-hall. Upstairs will be a drawing office, classrooms, chemical-room and master's room, with a lecture-hall 30 feet by 19, fitted with gallery seats. All the rooms will have matchboard dados, and the walls will be plastered. The tender of Mr. Thos. Moggridge, of Queen Street, at 1,851*l.*, has been accepted for the work, and it is hoped it will be completed in eight months.

THE SHEERNESS NAVAL BARRACKS.

AT the desire of the First Lord of the Admiralty, Mr. Austen Chamberlain, M.P., has addressed a letter to Mr. F. Gorell Barnes, M.P., giving the reasons which have determined the Board of Admiralty to abandon their proposal to build new naval barracks at Sheerness at a cost of 220,000*l.* for the accommodation of 30 officers and 1,000 men of the Naval School of Gunnery. Mr. Chamberlain writes that the question has for some time caused the Admiralty much anxiety, and has received careful consideration. The proposed site at Sheerness was never considered wholly satisfactory, but it was the only one available within reasonable distance of the gunnery establishment, and at the time it was selected it seemed impossible to conduct the work of the gunnery school elsewhere. This difficulty has since been overcome. The reports at present before the Admiralty concerning the Sheerness site were of such a nature that no Board could take the responsibility of building barracks for a large number of men in such a position. The greater portion of the site was below the level of high water, and on account of the nature of the soil, if the barracks were erected, it would be necessary to incur enormous expense in driving piles for the buildings to rest upon, while a thick layer of concrete would have to be put down over the whole area, costing at least 150,000*l.* before the buildings were begun.

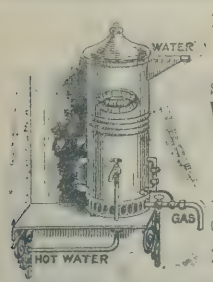
PRICE LIST AND ESTIMATES ON APPLICATION.

The Board of Admiralty were advised that such a site would be unhealthy. Reference was made to the fact that the site was submerged on the occasion of the disastrous high tide which visited Sheerness on November 29 last. Mr. Chamberlain admits that Sheerness is a healthy town and that the sanitary condition of the existing barracks is satisfactory, but that portion of the district is situated close to the water's edge, exposed to the healthy influence of the winds, and far removed from the unsanitary surroundings and conditions of the site of the proposed new barracks. The suggestion that the barracks should be built in Sheerness Dockyard, where the existing barracks are situated, has been carefully considered, but apart from other objections the Admiralty has found it impossible to provide anything approaching the space which would be required for the purpose. The existing barracks will continue to be used to the full extent of their capacity, but for the necessary extension the Admiralty will have to look elsewhere.



NEW BRIDGE AT GLASGOW.

HITHERTO the building of bridges by the Corporation of Glasgow has been confined to spanning the Clyde and the Kelvin, and within the last decade five or six such structures have been renewed, and two are at present in the course of erection or reconstruction. By the extension of the city on the south side the Corporation now, however, has been brought face to face with the necessity for improved communication across the river Cart. There are several bridges of the old-fashioned, narrow, "sow-backed" description in the neighbourhood of Langside, whose replacement with wider and more convenient structures must be a question of the near future. In the work of improvement and substitution a beginning has, in fact, been already made, the memorial-stone of a new bridge between Langside and the rapidly growing suburb of Newlands having been laid. The old bridge, which has stood for many years, was known as Millbrae bridge, and was only 12 feet wide. The new structure, which is in course of erection alongside of it, is 50 feet wide. It is a joint bridge, and the total cost of 4,523*l.* is borne to the extent of 1,300*l.* by the County Council of Renfrewshire, which shares the responsibility for the bridge along with the Corporation of Glasgow. The bridge is of Locharbriggs red sandstone, with ring heads, springers and parapet of grey granite, and the inside of the arch of white rock. The abutments will be surmounted by ornamental iron railings in extension of the parapet, and the foundations are of concrete, 12 feet below the scour of the river. Messrs. Morrison & Mason, Limited, are the contractors.

CHURCH CONGRESS AT BRADFORD.

THE next Church Congress will meet on September 27-30, in the city of Bradford, which is singularly fortunate with regard to the buildings in which the Congress meetings will be held. In many of the more or less ancient cities or towns in which the Congress has annually assembled since its inauguration in 1860 the accommodation for the principal meetings has been totally inadequate.

On the average 4,000 people come from all parts of the country to the Congress and have to be accommodated. The result therefore has been that temporary buildings have very often been erected in uncentral positions, which have been costly and frequently unsatisfactory with respect to acoustics, ventilation, heating and lighting. But in Bradford the principal meetings will be held in St. George's Hall, which will seat 4,000 people, and provides also reception, reporters' and waiting-rooms. It is centrally situated, and it is admirably adapted in every respect for the Congress meetings. In addition to the general there will be sectional meetings, which will be held in the Technical College, which will accommodate 800, and was erected in 1882 at a cost of 30,000*l.*; in the Mechanics' Institute Hall, near the Town Hall, which will seat 1,500; and in the Central Hall in Manchester Road, with ample space for 900. In the Church Institute, which is a handsome building in North Parade, the secretaries have already a suite of offices. In this building there will be writing, typewriting and general reception-rooms. There will be post, telegraphic and telephonic offices, and a room for postal and other messengers. And last, but not least, the Mayor of Bradford will hold a reception in the Town Hall, which is a magnificent building erected at a cost of 160,000*l.* The tower was partially copied from the tower of the Town Hall of Florence, and possesses one of the finest clocks with chimes in the United Kingdom. The chimes rival in sweetness those in the cathedral of Bruges, and strike every quarter, and are constructed to play a selection of sacred and secular tunes every three hours.

MAKING VENEERED DOORS.

Visiting a large wood-working factory some time ago in New Haven, Conn., where veneered doors are made in large quantities, says a correspondent of the *Canadian Architect*, I interviewed the foreman with regard to the method of manufacture of these doors, with the following results :—"Our first operation is to take common coarse white pine boards, with sound knots, and which have been well kiln-dried. The stock used is generally 16 feet long, 1 by 12 inches. This stuff is surfaced on both sides by a Daniels planer without regard to thickness, as some boards are thinner than others, while others are warped in drying, and the thickness of the boards is immaterial, perfectly seamed surfaces only being necessary. After the stock is planed up it is cut into such lengths as the bill of doors calls for. They are ready now to be glued up The face board of whatever hardwood to be used is planed generally to $\frac{3}{4}$ of an inch thick, and is also run through a Daniels planer. The stock is now ready to go to the glueing press, and as the Daniels planer makes the best glueing surface in the world, no scratch planing is needed. After properly heating in a box the stock is brought out and carefully glued, the hardwood face parts marked for it. From three to five parts are put in the press at one time, and a pressure of 20 tons, brought down by screws, is put upon these parts. After remaining in the press the proper time they are taken out, and generally remain several days before being worked up, which gives the glue plenty of time to harden. When ready to work again these parts are taken to a Daniels planer and squared up, after which the parts are taken to a very nice cutting table or bench saw, and are cut up to sizes required, leaving them $\frac{1}{8}$ of an inch large for future dressing. It is a positive necessity that the saw cuts free and clear, as heating has a tendency to warp the stock or spring it slightly, which would make it necessary to dress the stuff again. If the saw does not heat, the stiles come out perfectly straight, and these stiles can be laid on a Daniels planer bed and a light shaving taken off. They are now straight, and if the saw table is in good condition, square, the other side may be finished with pony planer or with a Daniels ; I prefer a Daniels, because it makes a better glueing surface, and if the planer is in good shape the work is turned out from the planer perfect, so far as square and surface are concerned. The work is now ready for the veneering, the thickness of which is immaterial, as it may vary from the thickness of thin paper to $\frac{1}{4}$ inch. Heated cauls are now used for the veneer, and the stiles, if heated at all, are just warmed, and the veneer glued on by piling up with a hot caul between each stile. The old-fashioned way of making veneered doors may do very well when only two or three doors are to be made, but in these days of sharp competition we are obliged to adopt the quickest methods compatible with efficiency and good finish. I may say we never make less than fifty doors at a time."

PLYMOUTH WATERWORKS.

On the 21st inst. the Corporation of Plymouth celebrate their annual "Fyshynge Feaste" and the completion of the Burrator reservoir. This reservoir has been constructed by the Corporation. Its main embankment is the third largest stone dam in the country, and is the only one constructed of granite. The engineers for the scheme are Mr. James Mansergh, engineer, of Victoria Street, and Mr. Edward Sandeman, of Plymouth. The waterworks of the Plymouth Corporation are believed to be the oldest waterworks established by a municipality which have been continuously in the ownership and under the control of the municipality since their inception. London, as a municipality, undertook the construction of waterworks before Plymouth, but London has parted with its waterworks undertakings as a municipality, and is now supplied entirely by companies. The Plymouth waterworks have the further additional interest in that they were constructed by Sir Francis Drake, the great navigator, under powers obtained in the reign of Queen Elizabeth, the Act of Parliament showing on its face that they were designed at that day not merely for a local but also for an imperial purpose, viz. "the deepening of the Plymouth harbour, supplying Her Majesty's ships of war, and also for the purpose of extinguishing fires in the town occasioned by the assaults of foreign Powers." The Fyshynge Feaste is an ancient ceremony, which has been continuously observed for upwards of three centuries, and the only two toasts then drunk, and these being drunk in silence, are (1) "To the pious memory of Sir Francis Drake" (this is drunk in water taken from the works); and (2) "May the descendants of him who brought us water never want wine." On this occasion, in celebration of the construction of the great dam, there will be, in addition to the usual Fyshynge Feaste, a banquet in the Guildhall after the event, to which most of the notables in Devon and the adjoining county will be invited The last stone of the dam will be laid on the 21st instant.

EMPLOYERS AND EMPLOYED.

In the section of Economic Science and Statistics of the British Association the presidential address was delivered by Mr. James Bonar, M.A., LL.D., F.S.S., who contrasted the old and new theories. He said :—

Between the extremes of (*a*) free subjection to a leader and (*b*) the submission of a slave who has no choice in the matter, there are in our society various grades of subjection to others, subjection for their ends chiefly, for our ends partly ; and they cannot be split into two simple groups by a physical test. Industry especially gives plenty of instances of the temporary subjection of one man to another for definite ends and over fixed periods of time. We can hardly cope with nature successfully at all without combining against her under leaders. It is certainly an essential feature of our present industrial system. As a man commits his goods to be used by another for him, so he commits his person to be so used, for another's benefit, but also for his own.

Now that slavery is gone, it has become as hard to prove a complete "expropriation and exploitation" of the labourer in industry as it is hard to prove plagiarism in literature. The degree of the "exploitation" must always be considered. Were the relations of employer and employed those of Prospero and Caliban, or of Prospero and Ariel, or only of Oberon and Puck? There are many degrees, and it is a long way from the top to the bottom of the ladder. In an army the leader is not using the led for his own purposes ; though he has soldiers under him, he himself is a man under authority ; and he is using them for a common cause, which both have at heart. Such service is not servitude if the cause is really at heart on both sides. So it might be, and is sometimes, in industry ; but we have at present, perhaps, more of the worse degrees than of the better. There is little liberty and much servitude when the workmen have no interest but their wages ; they are used directly for another's ends, and only indirectly and accidentally for their own. The leaders and the led can justly say of each other, "They are nothing to us but means to our ends, our profits or our wages."

The old economists took little note of such distinctions. It seemed enough to them that there was a legal contract. Even Burke, who spoke in his first pamphlet (on "Natural Society in 1756") of the "slavery and burdens of the poor," and of nine out of ten of the human race as passing their life in miserable drudgery, speaks in this last pamphlet (in 1795) as if there was no cause for misgivings in this connection ; a contract once made could not be a hardship to either party, for a contract is a compromise, both giving and both taking what seems the best possible equivalent at the time.

Yet in almost all contracts there is what Professor Pantaleoni called lately "economic strength" on the one side ; and there is "economic weakness" on the other. It is where the weakness is great that the contract galls even if it has been the less of two evils ; and there appears to be as much servitude as liberty. The weaker is made the tool of the stronger, the tenant of the landlord, the workman of the employer, the clerk of the merchant. Professor Pantaleoni, with his ingenious casuistry, would persuade us that we can seldom pronounce on which side the economic weakness lies, especially if we look to the future as well as the present. He gives us many instances where the tables can be easily turned. Like the Platonic Socrates arguing in the "Republic" against any sure definition of the interest of the stronger, he hints that the antithesis can hardly be used with confidence at all.

But a broad distinction is not unlawful or useless because there are border cases that elude it. The vegetable world may be broadly distinguished from the animal or from the inanimate, although there are equivocal creatures on the border lines. So here in the industrial world we can make broad distinctions and preserve them with a little care till we come to the border. If we interpret economic strength to mean independence, we find that in most contracts the strength is ascertainably greater on one side or the other ; and it might be argued that contracts are healthiest in proportion as the parties are nearest to equal independence. It is desirable that they should be independent, not indeed of all authority, but of the power of one another, so that neither shall be master, though the one may be leader and the other may agree to follow. A large number of men, perhaps the majority in civilised countries, are without this independence. It belongs, indeed, not only to those of large possessions, but to all of great talents sure of their market. It belongs, in a less degree, to ordinary skilled labour. But it does not belong to the man possessed of an unmarketable talent and no second-rate powers that are marketable. It belongs hardly at all to the day labourer, especially if he has given hostages to fortune ; his dependence is such as practically to fix his fate in the world. "A porter or day labourer," says Adam Smith, "must continue poor for ever." His dependence perpetuates itself.

Some modern economists have been so impressed with this overpowering influence on the poor of their poverty that they

MAW & CO. *will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,*

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

have been tempted to make it the chief factor of all history. Where there is no land to be had for the asking, they say, or where there is no common ownership of the means of production, there is necessarily weakness or dependence on the side of the employed. The causes of this dependence are the causes that have made civilised nations what they are, with all their institutions, political and social; economic causes are the supreme controlling, and even originating, causes of history.

If this were so, political economy, which began, like all other studies, by being nobody in the world, and after much toil was recognised indeed but only as "slight, unmeritable, meet to be sent on errands," rather as a phase of wisdom than as a branch of science, would end by being the only authority of any consequence. This position, very trying to its natural modesty, is one which it should not be flattered into hastily accepting. We must not carry into science the methods of social revolt, and say with the disinherited, "Since you grant me nothing, I shall claim everything."

It is no question whether economic conditions are one cause, but whether they are the only real cause. That they are one cause is so evident that the earliest theorists have paid regard to them. They have been ignored only in countries where nature has made livelihood easy, and man can with an easy mind take no thought for the morrow, or for food, raiment and dwelling. Elsewhere the struggle for existence has never passed without notice. Wherever there is a marked distinction between rich and poor, the economic factor in human life is sure to acquire great importance; and thoughtful men who are preoccupied with the discomforts of the poor are ready to count the economic factor the most important, the leaven that leavens the whole lump. This preoccupation is at the bottom of nearly all Utopias, even the Greek of Phaleas and Plato. Once arrange the production and distribution of wealth, and all other blessings will be added unto you; that is the tone of them all. Sir Thomas More, whom we might call the Archon Eponymus of modern socialists, would as a devout Christian have disclaimed such materialism; but in his own Utopia the chief peculiarities are the economic. The exaggeration is one into which we easily slip if we gaze only on the truth that circumstances and surroundings greatly influence human life; we become astonished that kings and governments have so often neglected this truth, as if it were the only truth that they have neglected. It was in this way that Robert Owen was led to overstrain the facts; and socialists as a body have taken no special pains to avoid exaggerations which could add a rhetorical force to their claim for a radical change. But it has been left for very recent writers not almost but altogether to ignore the influence of the spiritual environment, and to declare the material surroundings to be not merely a great part but the whole wherever the institutions of society are concerned. This was first done by Marx and Engels. It has been done lately by Professor Loria, and Professor Patten betrays an inclination to follow the same course, though with more caution.

(*To be continued.*)

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

18174. William Rowland Pedler, for "A method of removing lime from bricks."

18185. Baron Harris, for "A rhomboid chimney-flue brick."

18185. John Mell, for "An improved asphalte roofing for buildings."

18210. Harold Tyrrell Grainger, for "Improvements in bricks or blocks for building."

19969. Leathor, for "Ventilating appliances."

22684. Dalton, for "Presses for the manufacture of and undercutting of tiles, bricks and other articles."

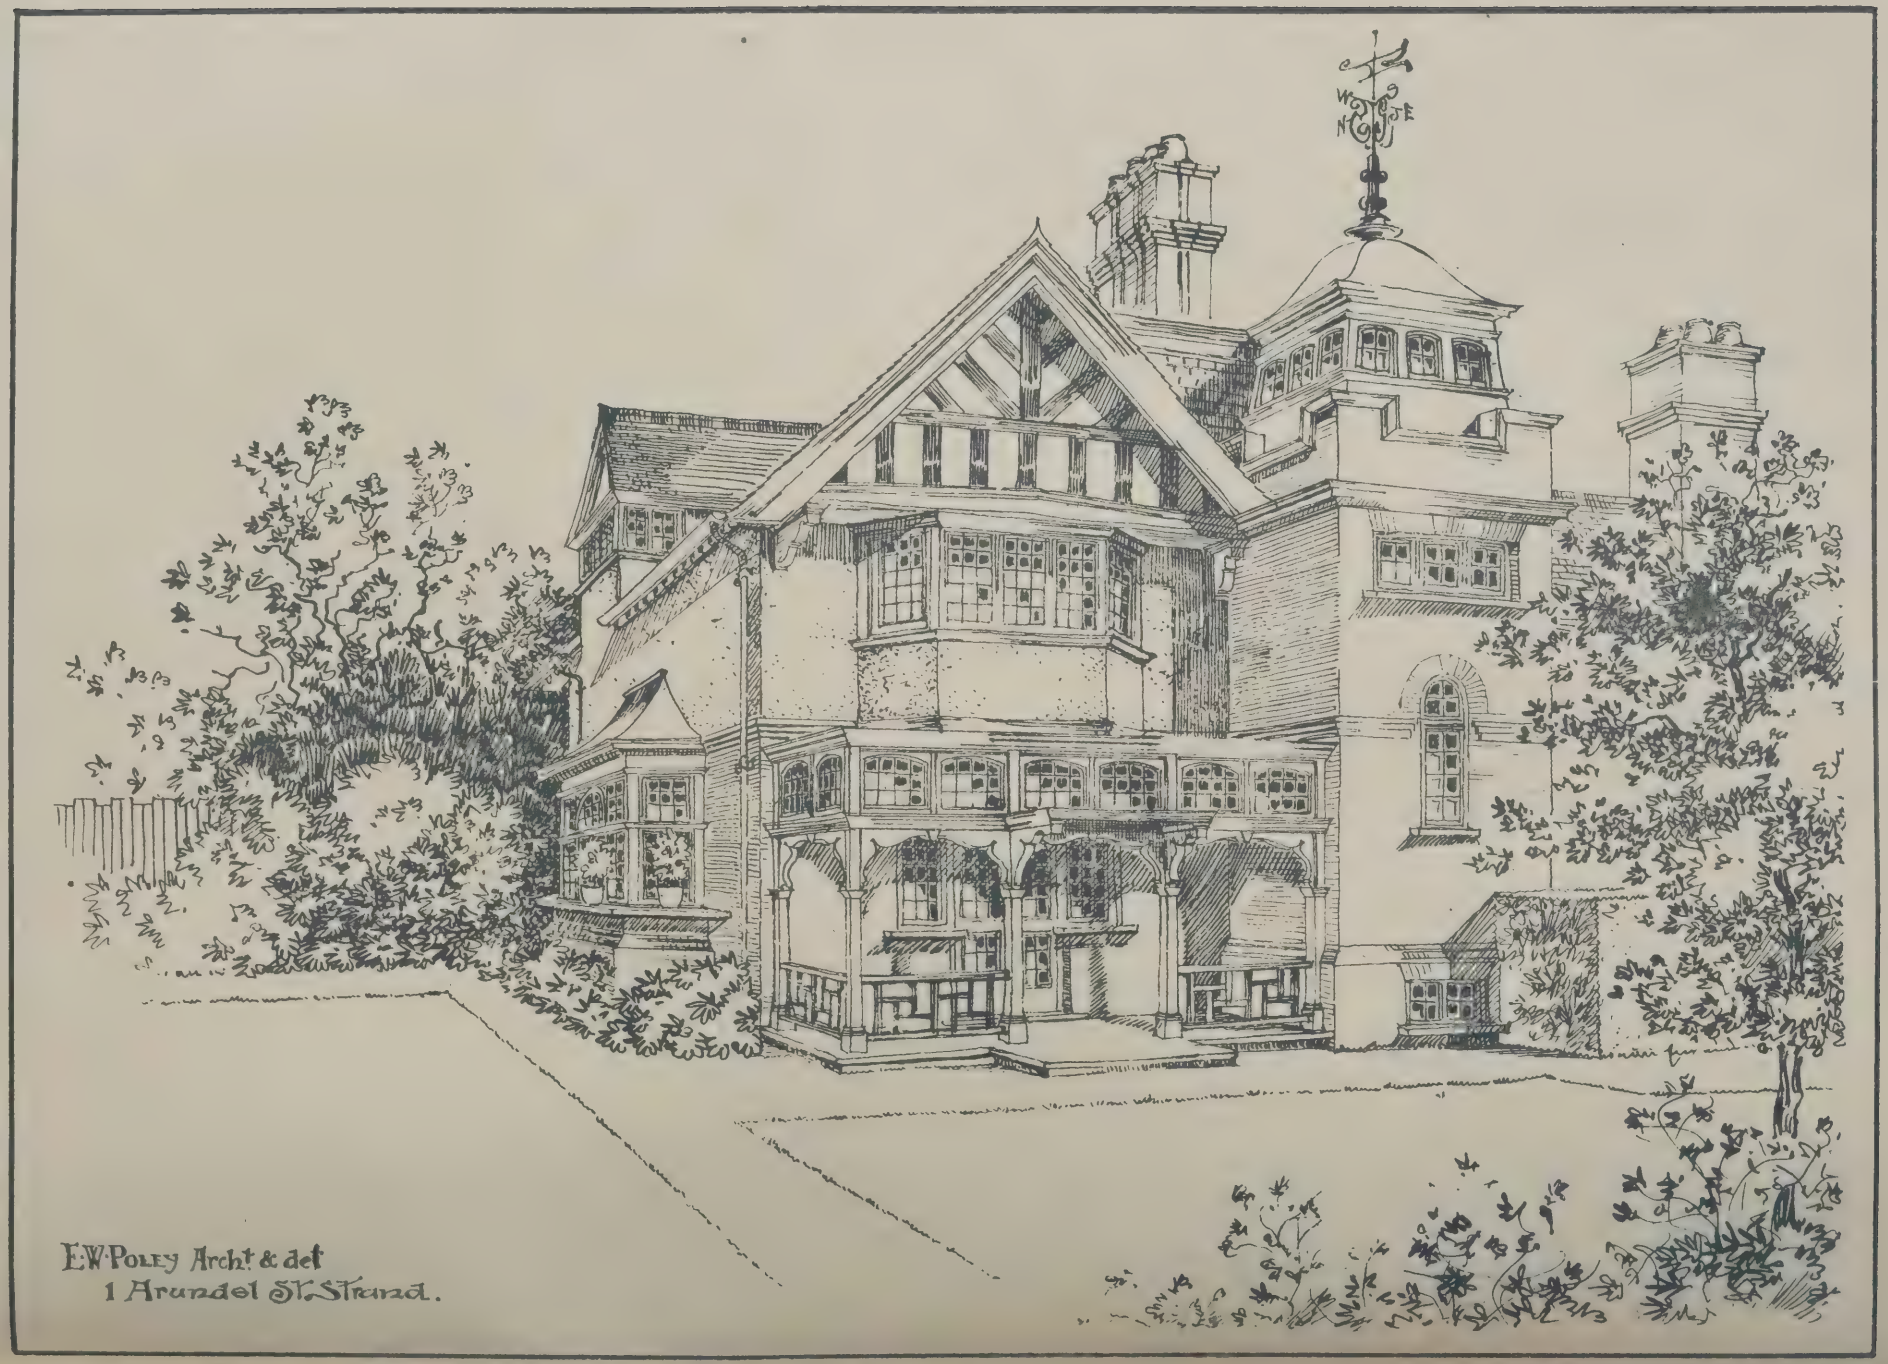
16284. Coe, for "Devices for applying metallic leaf for decorative purposes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Pau Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.



"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

THE WEEK.

The meeting of the British Association at Bristol must have drawn more general attention to the injurious effects which are likely to follow the indiscriminate construction of electric railways of various kinds. It is only to be expected that projectors and engineers will give their sole attention to profits, but there is much else which needs consideration. Mr. W. H. Preece, the Post Office electrician, is not an alarmist, but his observations during the past eight years on the effects of the City and South London Railway are almost enough to give alarm. He told the Association on Tuesday that the whole of London was found to be disturbed by the currents of that line. Electric magnetic induction, the moving of magnetic masses of iron and leakage were among the causes. On one occasion it was found that the potential difference between the two ends of the line passing through the Post Office was as much as 10 volts, with the result that special currents were produced. What might follow from the disturbances was shown by a few examples. In 1889 one of the alternators at the Deptford electric-lighting station came into contact with the earth, and it was felt in every circuit in London, and observed even in Paris. It threw over the block signals on the North-Eastern Railway and was the cause of serious danger. This was remedied, and within the last four or five years they had not observed any traces of disturbance caused by Deptford. Disturbances had been observed in Bristol, Leeds, Liverpool, Blackpool and other places, but many efforts had been made to remedy it and this was not difficult. In conclusion, Mr. Preece declared that the use of the earth was a vested interest for the whole nation. It was the right of scientific observers, and its acquisition by the force or might of those great electrical industries was to be resisted. Professor Fleming, at the same meeting, treated of the electrolytic corrosion of gas and water pipes by the earth-currents from electric railways and tramways. According to him, with street railways having an uninsulated return-circuit, no amount of bonding of the rails would entirely prevent earth-currents, which might be gathered by gas or water pipes. The danger of corrosion of such pipes would generally be greatest when they extended for some distance parallel with the rails, and the current must pass from the pipe into the surrounding soil. In rapidity of destruction a new, clean pipe might possibly succumb even sooner than an old one protected by a dense coating of oxide; but when actual perforation of the pipe did not occur, there might be an ageing action that shortened its life.

The third report of the committee appointed to investigate the Lake Village at Glastonbury was read at the final meeting of the British Association on Wednesday. Since presenting the last report much progress has been made with the exploration. Twelve more dwelling mounds have been examined, as well as the ground between and around them. The southern end of the settlement has been completely explored, and the investigations have yielded much of importance. The timber substructure in this locality was in a better state of preservation and more massively made than in any part of the village hitherto examined, the arrangement of the logs being exceptionally clear. Some of the dwelling mounds were of more than ordinary interest in their construction, and from the various objects found on and around the floors, the following observations in connection with them may be specially noticed. Mounds A, B C and D formed an interesting group, showing the gradual growth of the village and the construction of dwellings from time to time as they were required; this was easily recognised in these mounds by the floor of one mound overlapping the floor of the mound immediately contiguous to it. The clay of mound A overlapped that of C, B and C that of D. Mound A was the latest construction, D the earliest, B and C were of intermediate date, and the dwellings may have been of contemporary erection. Mounds A, B, and C were of medium size; the foundation of wood was strong and well arranged, especially under mound C. Mound D was remarkable for its series of baked clay hearths, and for a circular basin-shaped depression in the floor of the dwelling within a foot or two of one of the uppermost hearths. The sides and base were hard-baked, and it appeared to have had a semicircular moulded rim raised 2 or 3 inches above the level of the floor; it measured 2 feet across the rim, was 9 inches deep, and the sides were nearly straight, sloping downwards and inwards towards the base, which was about 21 inches in diameter. It contained fragments of the fallen sides and a little fire ash and charcoal. A somewhat similar depression was discovered in mound J, and was described in the last report. Dwelling mound D was also noteworthy for the number of bone needles, broken and complete, found with numerous splinters and sharp fragments of bone near them. Mound E was of large size, oval in shape and composed of five layers of clay; it contained two hearths of stone and several of baked clay. In this dwelling-mound there were found the remains of what may have formed a small furnace of baked clay, fragments of several three-cornered crucibles and some small pieces of bronze. Mound F was small and had not the appearance of a dwelling-mound. It contained three remarkable groups of clay hearths, each group consisting of three superimposed hearths. Associated with this mound were quantities of pottery and fire ash. The chief feature in the dwelling mound A A was the thickness of its clay floor, the vertical measurement of its thickest part being 10 feet; the mound was fairly symmetrical in outline and was about 30 feet in diameter. Beneath the lowest part of the clay, and lying in a layer of brushwood and rushes, part of the framework ostensibly of a loom was discovered; judging from its position, and from the worm-eaten condition of the wood, it had evidently been discarded and thrown away before the first dwelling belonging to this mound was erected. Amongst the timber used in the foundation of the mound were many piles and pieces of wood quite disconnected from the purposes originally intended, and evidently belonging to a previous arrangement at another part of the village.

On Saturday the surveyor of works of Bath, Major Davis, described the small leaden cross which was found in the course of the excavations in Bath a few months ago. Several theories of the origin of the relic were propounded after its discovery. According to Major Davis the cross is of Saxon origin and dates from the year 972 or 977. He thought it commemorated the death and burial of an early Saxon queen, the daughter by marriage of Alfred the Great, and the grandmother of the first king of England, a king whose coronation took place in the city of Hot Bathon, and whose memory for hundreds of years was commemorated in Bath by the periodical selection of a citizen, who ruled her pleasures and labours as king of Bath. The city is so associated with Roman remains, there is a peculiar satisfaction in everything which demonstrates that later comers were able to appreciate the advantages of a place on which nature has lavished so many favours.

The Canterbury Town Council have decided to erect municipal buildings at an expense of 20,000*l*. It will, of course, be necessary to obtain the sanction of the Local Government Board for the borrowing of that sum. The plans were prepared by Mr. Campbell, the city surveyor. The delay in carrying out the scheme arose from the difficulty of negotiating with the owners of premises adjoining the site. It is now understood that the work can be completed without any expenses on account of light and air, for there will be no interference with adjoining properties. Some of the members express their disappointment that the plans were not obtained by competition, but the familiar excuse of urgency was brought forward in order to put an end to discussion of the subject.

PREHISTORIC ART.

THE address which Mr. BRABROOK delivered as president of the section of anthropology at the Bristol meeting of the British Association contained a reference to two additional examples of prehistoric art. One represented a figure of a bison, the other was a figure of a woman, both drawn on bone with a sharp-pointed instrument. It is needless to say they are not of great value if considered as works of art. Their interest is based on other grounds. In the first place, like the Bruniquel, Périgord and Kesserloch incised work they afford additional evidence that men practised the art of representation before they attempted conventionalised forms. They also show that men were inspired by pleasure before thinking of purpose. Apparently the prehistoric artists who scratched figures on bones thought only of the satisfaction which was derived from displaying their power and the admiration which was expressed by the men and women who looked on at the performance.

In such attempts at art we have a primitive testimony to the truth of the theory that art at its best is a sort of game or play. The world has changed since the days when the bones were engraved, and there has been evolution to an extent which is almost incomprehensible. But feelings seem to remain in their pristine condition, and modern French and English sculptors are, therefore, not likely to be more happy in the completion of their masterpieces than were the artists who drew the elks and bisons we can see in collections of prehistoric remains. In the early as in the late cases there was satisfaction in the exercise of skill, successful imitation afforded pleasure to those who produced and those who admired, and as men were much alike at all times, the early artists may have expected a reward for their work from those who were ambitious to possess the incised bones. To prehistoric man the simplest attempt at representation must have had an importance which we cannot realise. He could hardly imagine the physiological and other differences which separated him from the wild animals which surrounded him. He was able to kill some of them, but they also possessed a similar power. He was often one of their victims. They showed no disposition to acknowledge him as the "lord of the wide world and wild watery seas." But inferior as he was to the mammoths who were his contemporaries, they were unable to make a sketch of him or of any other animal. The rude engraving was a token of superiority, a revelation of future supremacy. It was almost a title to possession, for the drawing of anything gives us knowledge of its qualities; and to have a view of a reindeer always in a cave or hut was to give opportunities for devising new means for the animal's destruction. We do not believe the representations were produced with an eye to utility or as aids to the hunters, but since hunger was never at a remote distance from primitive man he would not in planning a campaign hesitate to take a hint about the weak points of his prey from a work of art.

Modern curiosity would be gratified if the ancient artists were more varied in the selection of their subjects. An elk or an elephant is interesting enough, but there were simpler things to be seen of which we should like to have a suggestion. The great beasts were however of importance, not only as supplying food, but as means to excite the imagination. If cats were able to draw they would long confine their efforts to representations of mice, and the pictures would recall many a delightful quarter of an hour which was spent in playing with a victim. A figure of a reindeer peacefully browsing would also bring to the minds of a family of hunters the occasions when, after a long ambush, they succeeded in capturing unsuspecting victims.

Among a superstitious people it may also have been believed that a representation was a charm and an aid to the destruction of whatever object was represented; but that is a subject which must always be in doubt, and which we need not consider. It will be better to think of prehistoric art as something which appealed to a peculiarity that belonged to man alone, however wild might be his state, and ministered to his pleasure if not to his profit. For, as far as can be judged, the earliest attempts to represent animals were not aids to men's adornment. The bones were not intended to serve like modern trinkets, and were not sharpened into weapons. They were simply things which could be dispensed with, but on that account acquired more interest. If judged by the law of utility, the most successful of them was not worth a piece of chipped flint.

As we are unable to discover any purpose which the incised bones could serve, we cannot be confident there was any foresight exercised by the artist. Under all the prehistoric representations of men or animals which are known, the judgment that Parson REYNOLDS inscribed on his son JOSHUA'S early attempts might be inscribed, "Done out of pure idleness." When we are able to realise purpose and correspondence between a form and the space it occupies, then we generally have examples of conventionalising. The Indians of North-Western Canada are able to make very serviceable weapons which are adorned with carvings imitated from various kinds of organic life. But commonly it will be found that savage tribes realise that the knobs, hollows and sharp outlines which kill or maim in the shortest time are only to be combined when there is license in the adaptation of natural forms. A reindeer's antler would inflict an ugly wound, but it might become more dangerous to the owner than to his enemy. An adaptation of one on a club would be as death dealing as a sword from VULCAN'S smithy. Many ornamental forms, on which time and later uses have conferred a sort of sanctity, may have had their origin in the weapons which were wielded by prehistoric warriors. The beak head, billet, chevron, dog's-tooth, &c., for example, look as if they were derived from militant rather than contemplative men, and probably were among the first efforts to combine art with utility. The line drawings of the elk and elephant, on the other hand, were suited to afford a sort of quiet enjoyment, to soothe the savage mind for a time, and in that way are allied to the highest art. The conventionalisms which we see on the earliest weapons could never be expected to have such an effect; they were stimulants to action, rude efforts to express the desire for vengeance, spells to delude ignorant men into a belief that they were irresistible. Among the Chinese until a late period there was a belief that hideous faces on shields were able to paralyse adversaries, and the Homeric heroes evidently gave way to a similar superstition. The myth of MEDUSA'S head may have come from a savage's war club or shield.

Much as primitive man may have suffered by the efforts of artists to create forms that would strike terror in his soul, there is some reason for concluding that he could be still more overcome by formlessness. MILTON, who was learned in old superstitions, when he desired to be most impressive became indefinite, and left the reader's susceptibility to create amorphous beings. What artist could illustrate the description of Death, although to many it is not incomprehensible?—

> The other shape,
> If shape it might be call'd, that shape had none
> Distinguishable in member, joint or limb,
> Or substance might be call'd that shadow seem'd,
> For each seem'd either; black it stood as night,
> Fierce as ten furies, terrible as hell,
> And shook a dreadful dart; what seem'd his head
> The likeness of a kingly crown had on.

This is more impressive than would be a very realistic description, for it does not appeal to the understanding or ordinary intellectual powers. The early idols of all lands appear to have had some of the qualities of MILTON'S creation, and to be beyond the criticism that vision justifies. The fear may have come from the spectacle of a meteorite falling from the sky. Professor H. A. MIERS adopts that view, for in a paper he read at Bristol he remarked that "among the various sources to which stone worship is ascribed in anthropological works mention is rarely, if ever, made of the worship of meteorites; it is urged that when meteorites fell in early times—and there is no reason to believe that they fell any less frequently than now—they must have provoked religious awe. Several instances are quoted among recorded falls in which this was certainly the case, and some in which the meteorite became an object of worship."

Who can assert with any confidence that the meteorite was not the precursor of the idol in wood or stone, nay, of the chryselephantine ZEUS, by PHEIDIAS, which was one of

the wonders of Olympia and of the ancient world? If so, it would be reasonable to conclude that modern art has had three sources, viz. the graved lines of animals, the carved lines on weapons, and the mystery which was created by meteoric stones.

THE ARTS UNDER WILLIAM III.

APPARENTLY it was Lord MACAULAY'S intention to have recognised the arts in his "History of England." But he was hardly qualified to treat of the subject. He could write sonorous sentences about pictures, and so learned a man could not neglect reading biographies of artists. There is, however, little in his writings to suggest that he was able to appreciate either form or colour when at its best. From the character of his style it might be supposed he would be an admirer of RUBENS, but as the great Fleming did not work in England during the period to which the History was confined, there was no opportunity offered to MACAULAY for describing the massive draperies and glowing colours of the master.

For an historian who was indifferent to the arts there could not be found a more suitable period than that which commenced with the accession of JAMES II. and ended with the death of WILLIAM III. Under happier circumstances JAMES might have encouraged artists like his brother. He inherited a little of his father's love of pictures, and it is generally supposed that St. Paul's Cathedral embodies some of his notions about architecture. But his favourites were not well adapted to be subjects of fancy portraits like the voluptuous beauties who afforded so much employment to Sir PETER LELY. During his short reign JAMES was so much occupied with plots against the English Constitution and with efforts to punish all those he considered to be enemies, he could not find time to appear as an amateur. WREN was the only Englishman who merited to be considered as worthily representing art while JAMES was on the throne. Foreigners may have anticipated the coming revolution, for they kept away. Among the few who ventured across the Channel LARGILLIERE and CHARLES DE LA FOSSE, the Frenchmen, alone were possessed of a reputation.

King WILLIAM, as a Dutchman, might be supposed to have a little love for art of a domestic kind. In the Hague he submitted to have pictures in his rooms. But a prince who was compelled from his boyhood to engage in a struggle for his own and his country's independence with the warriors and statesmen of France and its allies could not be expected to enjoy the details of cabinet paintings. WILLIAM did not underestimate the value of his victories, but he gave no commissions to have them perpetuated on canvas. He submitted to have an occasional portrait taken of himself, but, judging by the expression, he was likely to have considered his sittings as wasted hours.

It proves WILLIAM'S insight into character when we learn that WREN'S zeal in the service of the public made him a favourite with the king. But WILLIAM cared more for fortifications and barracks than for private buildings. He did not, however, oppose Queen MARY when she proposed to have a fine palace erected at Hampton Court, a place that was supposed to be less unfavourable to sufferers from asthma than London. At her request he prepared several designs, one of which pleased the queen. The king, unhappily, was no admirer of fine architecture, and he insisted on the selection of a design which, as realised, was considered to be unsuitable, until the revival of the Dutch style imparted interest to it. As in St. Paul's, WREN worked under restrictions. He was not satisfied with the palace, but WILLIAM saw something in it which recalled Holland and testified to his domestic sovereignty.

To MARY we are also indebted for the project of Greenwich Hospital, a group of buildings which alone saves the approach to London by water from meanness. But it might not have been erected if MARY had not died unexpectedly. "While she lived," says MACAULAY, "scarcely any step was taken towards the accomplishment of her favourite design. But it should seem that, as soon as her husband had lost her, he began to reproach himself for having neglected her wishes. No time was lost. A plan was furnished by WREN, and soon an edifice, surpassing that asylum which the magnificent LEWIS had provided for his soldiers, rose on the margin of the Thames. Whoever reads the inscription which runs round the frieze of the hall will observe that WILLIAM claims no part of the merit of the design, and that the praise is ascribed to MARY alone. Had the king's life been prolonged till the works were completed, a statue of her who was the real foundress of the institution would have had a conspicuous place in that court which presents two lofty domes and two graceful colonnades to the multitudes who are perpetually passing up and down the imperial river."

In this case also WREN had not a free hand. The queen wished to combine some of the arrangements of the palace of CHARLES II. as well as of the Queen's House. According to HAWKSMOOR, who was clerk of the works, the royal court, which is nearly 300 feet square, is covered on the west with the court of King CHARLES II., and on the east with that of Queen ANNE, equal to it, and on the south the great hall and chapel. The court of Queen ANNE contains the great range, or wing, next the royal court. To the east of this is another range of building and the great pavilion near the Thames, for officers. The court of CHARLES contains the great wing on the west of the royal court.

The two buildings at Hampton Court and Greenwich offered a wide field for wall-decoration. ANTONIO VERRIO was at that time the first artist who would be offered a commission for such work. CHARLES II. employed him largely and JAMES also patronised him. VERRIO looked on WILLIAM as an intruder and declined to paint for the new king. By the persuasion of Lord EXETER he at last condescended to adorn the great staircase at Hampton Court, but he revenged himself by painting figures which helped to bring mural decoration into disrepute. THORNHILL was at a subsequent time engaged for the great hall of Greenwich Hospital, but his charges were disputed, and it is supposed he received no more than 40*s.* per square yard for his paintings, the price he was paid for his work in the cupola of St. Paul's.

Sir GODFREY KNELLER won the favour of WILLIAM III. It is supposed his series of court beauties for Hampton Court—another suggestion of the queen—won him his knighthood, a gold medal and a massive gold chain. WILLIAM was gratified to be spared the infliction of sitting for his portrait. It was in the succeeding reign the painter was most successful. POPE bepraised him and chaffed him alternately. DRYDEN, ADDISON and PRIOR were also among his eulogists. KNELLER was a genial humourist, and was able to hold his own in any assembly of wits. It is a pity he did not find somebody who was competent to write his biography at length, for he must have been as amusing as FUSELI.

KNELLER came from Lübeck, for WILLIAM did not show much preference for his countrymen who were artists. The tribe of VANS came across to England at a later period. SCHALKEN, who was fond of candlelight effects, once drew the king, and made His Majesty hold the candle until the grease ran down the royal fingers. LAROON, another Dutchman, made a drawing of the procession at the coronation of WILLIAM and MARY, and was one of KNELLER'S drapery painters. JOHN VAN WYCK represented some of the battles in which WILLIAM was engaged, but he was said to be more successful in smaller works in the style of WOUVERMANS. Lord SOMERS, who is one of MACAULAY'S idols, appears to have befriended SIMON DUBOIS, and after the painter's death acted as his executor. Another Frenchman named BERCHETT was sent by the king to paint the walls of the palace he erected at Loo. He also painted the staircase in Marshal SCHOMBERG'S house in Pall Mall. CLOSTERMAN, who came to England in 1681, painted portraits during WILLIAM'S reign, and was even supposed to rival KNELLER, but such reputation as he possessed was gained in Queen ANNE'S time. He must have been a brave man, for he resisted SARAH, Duchess of Marlborough. The duke told him it was easier to fight a battle than to reconcile the pair. Sir JOHN MEDINA, the Spaniard, received most of his commissions in Scotland. Apparently he had full-length and half-length figures painted for him, and he carried the canvases about. As he had only to add a head when he received an order, he was able to turn out portraits with unusual expedition.

Among the English portraitists JOHN RILEY was the most successful. Unlike his contemporaries he suffered

from diffidence, and was over fastidious. He might have succeeded LELY as the painter of court beauties if he possessed more worldly tact. He sought truth in his portraits. CHARLES II. exclaimed, when he saw his own portrait by RILEY, "Is this like me? Then, odds fish! I am an ugly fellow." RILEY received an appointment from WILLIAM, but he was never appreciated as he merited. HENRY COOKE was ordered by WILLIAM to repair the cartoons, and he produced portraits, staircases and ceiling paintings. He was a pupil of SALVATOR ROSA, and acquired some of the swagger and combativeness of his master. He killed his man and was obliged to run away and conceal himself in Italy. Another artist who was irregular in his ways was FRANCIS LE PIPER, who was the son of a Kentish gentleman. He drew in black and white and was one of the first of the Western artists to travel to Cairo in search of the picturesque. His studio was generally a tavern, and it was not difficult to obtain an example of his talent. It was only when he squandered his fortune he was obliged to work for money. LE PIPER was one of the most versatile of artists, but he could not guide himself. On his mother's death he inherited another fortune, but he did not long enjoy it.

England is indebted in a great measure to WILLIAM III. for "the authority of law, the security of property, the peace of our streets, the happiness of our homes." To attain those blessings was not the work of a connoisseur. LOUIS XIV. employed artists in abundance, who helped to persuade his subjects he was a god rather than a tyrant. WILLIAM OF ORANGE did not perceive that France derived substantial happiness from the arts, and on the whole it was better for England to have such a ruler than one of the dilettanti STUARTS, who purchased pictures but sold their honour and their country.

ANCIENT EGYPT.

ON Tuesday Professor W. M. Flinders Petrie delivered a lecture before the British Association at Bristol on "Egypt under the First Three Dynasties, in the Light of Recent Discoveries." His object, he said, was to give a summary of the principal discoveries during the last five years that had revealed the rise of Egyptian civilisation. It had been said that the beginning of the fourth Egyptian dynasty—the age of the Pyramids, about 4000 B.C.—was the furthest back that we could go. The puzzle was that there had been no trace of this high civilisation. But now entirely new discoveries during the last three years at Koptos, Nagada, Abydos and Hieracoupolis and various excavations had discovered remains belonging to the ages before 4000 B.C., which had hitherto been the starting point of known history. Beginning with the Libyan stock, with some negro mixture, which occupied Egypt in its earliest civilisation, he showed some of the objects he had found at Nagada—statuettes, games, slate palettes for grinding paint, beautifully ribbed flint knives of extreme delicacy, forked lances and arrows, carved spoons of ivory and bone, harpoons, bracelets and combs. These were at first temporarily assigned to a new race, as we knew nothing more about them; but now they could be safely assigned to the pre-dynastic stock about 5000 B.C, and even earlier. In the graves of this aboriginal race were found bowls of black clay with patterns imprinted upon them. They were of great importance in considering the relation of this civilisation to that of others in the Mediterranean. In each of the countries where this had been found—Spain, Bosnia, Egypt and Hissarlik—it was contemporary with the introduction of metals. Metals had just been introduced, and therefore in all cases this pottery was associated with the same state of civilisation. The proximate date of this was the close of the Neolithic period and the introduction of metals—viz. 5000 B.C.—and that accorded very well with the time necessary for arriving at the high culture attained by 1500 B.C. Therefore those discoveries were of great value in giving the relative state of Egyptian civilisation to that of the rest of the world at the introduction of dynastic rule. There was a wide difference between the people of 5000 B.C. and those of 4000 B.C., but no difference between those of the latter period and modern times. This showed that a different race entered the country about that period. Next came the earliest dynastic remains of the presumed tomb of King Mena, the founder of the dynastic history of about the date of 4700 B.C., then the remains of other royal tombs found at Abydos belonging to the first three dynasties. The skill of flint-working had undoubtedly gone down and was fast dying out. The gradual decay of flint-working between 4500 B.C. and 1500 B.C, as metals came into use and copper was gradually hardened into bronze, had no parallel in the world. Professor Petrie showed diagrams of cylindrical seals as used by the kings of the first three dynasties, and impressions of such cylinders which were vastly more frequently found than the seals themselves. He then showed a case exhibiting the earliest representation of Egyptian mythology and other vases, tablets and slates showing animals and birds, such as the hawk, bull, lion and leopard, which manifested a well-acquired knowledge of these animals, as well as of the ibex, gazelle and antelope. Large numbers of animals, such as the calf, monkey and dog, had been found modelled in green clay, together with a model of a lion in red pottery. These finds were very important, as they showed the skill of clay modelling of the earliest dynasty, the rise of the art of modelling, and the Egyptian ideas and appreciation of the forms of animals and of the human body. These important monuments of the civil life of the early kings proved that glazing was a specialty of the original people, and that Egyptian art reached its high-water mark somewhere before B.C. 4000. Other finds showed the kings in triumph over their enemies, receiving captive kings, opening the public works, or reclaiming the marshes. Others were vessels with dedications written upon them, and stone jars with chambers as storehouses for the king's soul. The handled copper vessels showed the most advanced metal-work found of the first three dynasties. The population of the pre-dynastic age was different in type from that of historical times, and in the early monuments the presence of diverse types was very clear, some being shaven, some bearded, some long-haired. We had at last before us evidence of the close of the period previously considered prehistoric, showing the development of the art, writing and civilisation of Egypt and the composition of a race which had since maintained its character during 6,000 years. The puzzle was how this civilisation arose, and we had discovered evidence to solve this puzzle. Egypt was then an originator in the arts and not a borrower, but ever since then most of the nations of the earth had been borrowers and not originators. Here we were studying the history of a country not borrowing but developing a vast and complex civilisation on its own resources.

Sir John Evans said that during the last few years, as Professor Flinders Petrie had shown, we had been able to unveil the progress of civilisation in Egypt over 1,500 years. The wonderful flint knives shown by slides had been the most important discoveries ever made in Egypt and must have been the culminating point of an art stretching over a vast series of years. He asked himself, Where was all that civilisation of B.C. 5000 developed? He hoped that the recent conquests in Egypt would materially assist us in investigating that matter and discovering more of the wonderful history of which we were now only on the threshold.

Mr. Arthur Evans thought a comparison of the pottery of Crete and Malta and other parts of the Mediterranean basin with that of Egypt helped to form a bridge over the gap which separated early Egypt from the dawn of civilisation in Europe. In respect of chronology he considered that Professor Flinders Petrie would be safe in assigning his discoveries even to an earlier date than he had done.

Professor Flinders Petrie, in his brief reply, said that he himself thought that he was well within the mark, but he chose the date he had fixed in order to be absolutely safe.

THE ART LIBRARY, SOUTH KENSINGTON.

A LETTER has appeared from Major-General Donnelly relating to the errors in the catalogue, of which evidence was given before the Parliamentary committee, such as "H. C. Reneue" and "Mariani Fasti" as the names of authors. He says in the *Times*:—

I am therefore authorised to state that these mistakes do not occur in the inventory catalogue of the art library, that is to say, in the catalogue of the library prepared by its staff from the works themselves when put into the library. They occur in the "Universal Catalogue of Books on Art," which was commenced in 1865 and published—avowedly as "first proofs under revision"—in two volumes in 1875. It was "compiled for the use of the National Art Library and the schools of art in the United Kingdom" from all kinds of English and foreign catalogues and bibliographies by a special staff, distinct from the staff of the library, working under the advice of a very strong committee of English and foreign experts. The catalogue was, as stated in the minute of the Lords of the Committee of Council of October 12, 1865, to "include not only the books in the library, but all books printed and published at the date of the issue of the catalogue that would be required to make the library perfect, that is, to compile a universal record of printed art books which are known to exist up to that period, wherever they may happen to be at the time . . . any reader in the art library of the museum would thus find a

clue not only to the works he was looking for in the actual collections of the library, but to other works . . . which had been ascertained to form part of other libraries, whether public or not, either in our own or in any foreign country, a reference being at the same time given, in the case of rare books, to the library in which they may be found." For the use of readers in the library there is, therefore, besides the inventory catalogue—to which I have already referred—of all the books in it, also another reading-room catalogue containing, in addition to the entries from the library catalogue of the books in the library, the titles of books cut from the Universal Art Catalogue of books outside this library. The difficulties attending the compilation of such a work as the Universal Art Catalogue are obvious, and the probability of its containing mistakes—a certain number of which occur, as is well known, in the most carefully prepared catalogues of libraries "in being"—is rendered far greater, especially in the first proofs, by the difficulty of avoiding the incorporation of mistakes in the excerpts from other catalogues of which it is made up. Of this nature are the mistakes given in the report of the committee of the House of Commons. "Deel," as may be seen from the entry in the Universal Art Catalogue, is taken from the 1864 edition of the "Catalogue of the Library of the Royal Academy of Arts, London." "Reneue" is also only in the Universal Art Catalogue; whence it came has not been traced. But another edition of the work to which the entry refers was properly catalogued in the Art Library Catalogue in 1865. "Fasti Mariani" was also properly treated in the old Art Library Catalogue as an anonymous work. The mistake is in the Universal Art Catalogue. There seems, I may say, some inherent danger in dealing with this book. The book, which the committee say is "on the Marian Annals," is in reality a Roman Catholic almanack of saints' days and holy days, with short notices and engravings edited by the "Congregatio Mariana" of Munich. A leading London paper says :—"'Mariani Fasti' as a proper name is imposing, and to a compiler who did not know Latin or had never read Ovid the suspicion that it was a record of events in Queen Mary's reign might not occur."

I trust, sir, when I add that the mistaken entries "Deel" and "Reneue" had been struck out in Mr. Soden Smith's time in the copy of the "Universal Art Catalogue" in the librarian's room it has been made clear that, whatever mismanagement there may be, the staff of the library—not one of whom was in any way connected with this piece of somewhat ancient history, the "Universal Art Catalogue"—are in no way responsible for the alleged "scandal."

With regard to the statement in the report that there is "at present no junior in the library who knows German, I have to state that of the present staff of the library, consisting of one keeper, two assistant keepers and three junior assistants, one of whom was appointed just before the committee reported, all but one, a junior assistant, have a knowledge of German.

As this letter is written at the request of and in justice to the library staff, it deals only with that portion of your article which directly affected them. I am to add that the more serious matter—the alleged dismissal of Mr. Weale, also referred to in that article—will no doubt be dealt with by the responsible Ministers in Parliament.

ENGLISH BOOKBINDING.*

THE commoner English bookbindings of the early sixteenth century were usually ornamented with impressions, in blind, from large panel stamps, many of which appear to have been of Netherlandish origin. They are largely heraldic, but several of them are illustrative of Biblical subjects or incidents in the lives of saints.

The coat of arms of Henry VIII. with Tudor emblems is commonly found, as is also the coat of Catharine of Aragon, and more rarely that of Anne Boleyn. These coats are generally upheld by two winged angels. On some of the bindings by John Reynes is a curious coat of arms of Jesus Christ, and on several of them occur a stamp bearing a large Tudor rose as a central ornament with a ribbon enclosing it, on which are the words, "Hec Rosa Virtutis de cœlo missa sereno Æternum florens regia sceptra feret." In the upper corners of this design are the coats of arms of St. George and that of the City of London, so it is supposed that the binder who used it was a freeman of the City of London. The initials of the binder often occur in the lower part of the panel. "I.N." probably stands for Julian Notary, "R.L." for Richard Lant, and so on, the binders often being the same as the printers. Although royal coats occur on several of these bindings, it is not at all certain that the books were ever royal property, and they should not be considered so unless their known history confirms such an attribution.

An early official note concerning an English bookbinder occurs in a patent of Henry VIII., dated February 22, 1530, making Thomas Berthelet the king's printer. This Thomas Berthelet also bound the royal books, and was the first English binder to use gold tooling on leather. A bill of his for such work still exists, in which he describes the bindings as being "after the Italian fascion in crymosyn satin," or "covered with black velvet." The note about the "Italian fascion," of course, alludes to the fact that many of Berthelet's early bindings are finished with gold tooling made by means of stamps cut in imitation of several of those used on fifteenth century Italian bindings.

It is, indeed, often difficult to distinguish between an early English gold-tooled binding and an Italian one, but there is one peculiarity about Berthelet's work even when it is most like the Italian originals, and it is that he nearly always used a black dye on the fillets with which these bindings are generally decorated. The black has in many cases worn off, but as it was made by means of some weak acid, the surface of the calf—in which leather the majority of Berthelet's bindings are—is usually eaten away to some extent, and the fact that the stain was originally there can be easily recognised. The Italian bindings on which these are modelled do not have these black fillets.

Berthelet bound books for Henry VIII., Edward VI. and Mary, and besides the calf already mentioned, he used freely white deer skin and vellum—as far as I know, he never used morocco, or, as it would then have been called, goat skin. As to the books recorded by him as having been bound in satin and velvet, there are no data by which they can be identified, but as each of the three sovereigns for whom Berthelet worked have left us specimens of bindings made for them in these materials, it is likely enough that some of them are really Berthelet's work. Because, however, of the utter difference in workmanship between the adornment of a satin or velvet binding as compared with one in leather, we cannot say certainly that, because in the satin and velvet books of the early sixteenth century royal English book we find no design that resembles Berthelet's stamps, they are not his.

The edges of valuable books were decorated with paintings and gildings of various kinds from a very early period, and Berthelet fully appreciated the value and beauty of this addition to the ornamentation of fine bindings. The particular manner in which he usually dealt with the edges of his books was to have them slightly tinted with some pale yellow pigment, and on this to write in gold the inscription, "Rex in Æternum vive." After these words occur, in many instances, the curious word "Nez" or "Neez." Among the several interpretations of this word that I have heard, one of the best is, I think, that of Mr. J. L. Scott, of the Department of Manuscripts in the British Museum. Mr. Scott thinks it may refer to Nebuchadnezzar. In the Book of Daniel these words are addressed to this king, "Nabouchodonosor esaei zethi," and the initial letters of these words make "Nez." The strong probability is that when this inscription is found on the edges of a book that belonged to Henry VIII., it was bound by Thomas Berthelet, the first great English bookbinder whose name is known to us. Berthelet sometimes finished his books with some reference to their subject, one of his on "Geometry" being decorated outside with triangles, &c.

The English binders were not allowed to have a very peaceful time for long, as in 1553 the influx of foreign workmen was so hardly felt that an Act was passed for the special protection of English printers and binders, and it was made unlawful for anyone to buy or sell any book ready bound from abroad, and among the registers of the Stationers' Company may be found several other petitions against the foreign workmen. Among these registers are many curious and interesting items about bookbinders, their apprentices and their methods, all of which are very carefully laid down ; indeed, some of the rules seem too stringent. For instance, in one dated "xxv. March, 1586," it is laid down that "in the volume called folio there maie be bound styched onelie ffortie sheetes and not above. In the volume called octavo twelve sheetes onlie and not above ;" and, further, on the same register it is ordered that no bookseller "shall putt any woorke . . . to be bounde unto or by any fforrayner, stranger or to any person whatsoever that are not freemen of this citie." Of course the foreigners—chiefly Frenchmen—became freemen "of this citie," and so in due time became practically English themselves, and it is very likely due to the taste and skill introduced by these no doubt excellent craftsmen that we owe much of the delicate workmanship that we find all along in English gold-tooled work. The ordinary processes of binding a book, although they are undoubtedly skilled labour, are such as any man with manipulative skill can easily learn, but the art of gold tooling on the finished leather is a very different matter and to be well done requires most delicate care and knowledge and the utmost skill and steadiness of hand. This art the French have certainly excelled in even up to the present day. So that possibly we must not regret too much that the highly skilled French workmen came

* A Cantor lecture from the course on "Decorative Bookbinding," by Cyril Davenport. Published in the *Journal of the Society of Arts.*

over and brought some of their careful finish to the enhancement of the good sewing and forwarding that they doubtless found here from very early times.

Henry VIII. and Elizabeth possessed several small books bound in gold, some of which still exist. They were generally enamelled as well, some of them being very fine specimens of such work. Such books must have been always of great value, and therefore they never became common; but no doubt there were many more of them than we have now left, as mention exists of such presents having been given to Queen Elizabeth's maids of honour. Some of these are still in private hands, but others can be seen at the British Museum, both in the Departments of Manuscripts and Printed Books. But, in fact, during all the Tudor period very decorative bindings were made in England. Berthelet set the fashion, and he, like all great masters, had imitators. More than that, his example encouraged others to strike out lines for themselves. Few names of binders at this time are known. It is supposed that John Day, a printer, bound some of the books that belonged to Queen Elizabeth. These are generally bound in calf, with black fillets imitated from Berthelet, but charmingly ornamented as well with real inlays of white vellum, on which are gold impressions from large blocks. The letters "I.D.P." occur on some of these blocks, and it is supposed that they mean "John Day Printer." I think these stamps have more of a foreign character than English, but it is possible enough that John Day had them cut for him by a foreign workman. The bindings are bold and excellent in design, usually bearing in the centre the royal coat of arms, the field being covered with what the French call a "semis" of triple dots. Some of Elizabeth's books have also a "semis" of roses. It is certain that Matthew Parker, Archbishop of Canterbury, employed bookbinders to bind the books he had printed at his private press at Lambeth. It is not now positively known if any of these bindings still exist, but it is very likely that the copy of his book, "De Antiqvitate Britannicæ Ecclesiæ," printed in 1572, which the archbishop is supposed to have presented to Queen Elizabeth, was bound under his direct auspices. It is bound in green velvet beautifully embroidered, the design being a park, within which are deer and roses, being in fact a play upon the word "Parker."

The most noteworthy collectors of this sixteenth century, as distinct from the binders, whose names and work are known, not counting the sovereigns who have invariably, from the time of Henry VII., been most constant and appreciative lovers of fine bindings, were Henry FitzAlan, Earl of Arundel, Thomas Wotton and Robert Dudley, Earl of Leicester.

Henry FitzAlan took advantage of the suppression of the monasteries in the earlier part of the century and acquired, in consequence, several valuable works which otherwise would never have left the security of the religious walls. Besides these priceless treasures, he also acquired many of the books that had belonged to Archbishop Cranmer, a large number of which bear his signature. The whole of the FitzAlan Library was bequeathed to his son-in-law, Lord Lumley, who was afterwards tutor to Henry Prince of Wales, and by this prince it was purchased in 1609. There seems little doubt that Henry FitzAlan had taste in bindings, the very few instances left as they were in his time being of considerable beauty, and bearing as a central ornament the Arundel badge of a white horse "courant" with a sprig of oak in its mouth. On one beautiful specimen this horse is represented by a little cameo of white leather inlaid on calf, the date of the printing being 1544, that of the binding probably about the same. Lord Lumley generally signed his books, but beyond this he does not appear to have changed them to suit his own fancy; but their next owner, the Prince of Wales, did so very largely—indeed, he rebound almost every book in calf bindings heraldically decorated. The best known of these bindings have in the centre the royal coat of arms with the silver label of the eldest son, and in the corners either the ostrich plumes, crowned roses, lions or fleur-de-lys, designed too largely for good taste. These are always stamped in gold, except the ostrich plumes, which are in silver. The books bearing these stamps are perhaps of the greatest general interest of any old royal English bindings, because they are sometimes to be met with outside the large royal libraries, some of them at some period of their history having been allowed to leave the remainder and get into the open market. Besides these, Prince Henry had others bound which have the Prince of Wales's plumes as a centre ornament; many of these are excellent in taste and pleasing in colour, the smaller ones especially. We owe a great debt of thanks to Prince Henry because he brought together at St. James's Palace all the old books that he could get hold of that had belonged to his royal predecessors, and by his appreciation of them and the additions he made not only by the accession of the libraries just mentioned of the Earl of Arundel and Lord Lumley, but also by that of Isaac Casaubon and a Welshman named Maurice, he actually laid the foundation of the royal library of England, which was ultimately presented to the nation by George II. in 1757, and has been preserved ever since in the British Museum.

Thomas Wotton, the father of the well-known writer, Sir Henry Wotton, was also a celebrated collector of books who had his volumes bound for him in a particular way. He died in 1587. His bindings are always in brown calf, tooled in gold with black fillets, after the style used by Thomas Berthelet. Some of them have a small coat of arms impressed in silver as a centre ornament, and many of them bear the words "THOMÆ WOTTONI ET AMICORVM" on them, being almost the same words as were used by Jean Grolier, Treasurer of France, at an earlier date. In consequence of the occurrence of this motto, as well as some distant similarity in the style of some of the designs used by both collectors, Wotton is known as the "English Grolier."

The decorative badge of the bear and the ragged staff, used by the family of Dudley, Earls of Leicester, is often found on books that belonged to Robert Dudley. The initials "R.D." are often combined with the badge, which is stamped variously in gold, in silver, and in silver and gold. The remaining gold tooling on several of these books is very well designed and decorative. Although the semis, or powdering, of various small kinds over the ground of binding designs occurs in English bindings made for Queen Elizabeth, the idea is considered to be French originally. In England the method of decorating the larger part of a book with a symmetrical repetition of small stamps did not come into any general use until the reign of James I., and under this king the semis was largely used. The most usual stamps used for the powderings are lions, thistles, fleur-de-lys and roses, and in many instances the effect is very rich. In combination with these are used large corner pieces and usually heraldic centres, and the decorative method of binding books in velvet stamped in gold was also made use of in this reign more than in any other, although it was first thought of in the time of Elizabeth, and was also afterwards done at Little Gidding.

John Gibson was appointed king's binder while James was in Scotland, and there is a list of books bound by him in Dibdin's "Decameron." Unfortunately, not one of these has been identified. There is, however, one binding which is likely enough to have been bound by him. It covers the original manuscript by King James of his "Basilikon Duron," written for the benefit of his "dearest son Henry the Prince." The book is very decoratively bound in purple velvet and rarely ornamented with thin plates of gold, engraved with delicate lines. The centre is the ancient coat of Scotland, with the collar and badge of the thistle, unicorn supporters and motto. Above are the initials "I.R.," and the clasp plates and corners are conventional thistles and curves. No other book is ornamented in this way. When James came to England John and Abraham Bateman were his binders, and they probably bound most of the books now left of his, but there is no certainty about any one of them.

During the reign of Charles I. the same style of binding generally prevailed as during his predecessor's time—powderings, heraldic ornaments and large corners; also between 1625 and 1642 were made the curious "Harmonies" of Nicolas Ferrar at Little Gidding. The finest of these were bound in velvet, tooled in gold or silver, with small stamps of peculiar designs. They were nearly always large books, which in those days was rare. One measures 29 by 20 inches, thereby strongly contrasting with the generality of printed books, which had been small ever since the invention of the typographic art. The decoration on most of the Little Gidding bindings consists of a circular ornament in the centre, and in each corner a quarter of the same. The velvet used is blue, purple, or green, and the leather is always black. These bindings are supposed to have been bound by the nieces of Nicholas Ferrar, under the special direction of Mary Collet, taught by a binder from Cambridge, and they have every appearance of having been made by skilled amateurs not possessing too many shop appliances. But for the encouragement of lady bookbinders, it may safely be said that no more splendid bindings have ever been made than those prepared by Mary Collet for King Charles and his sons. Both for size, magnificence of colour and richness of decoration they have never yet been excelled. The finest specimens now left are in the possession of the Marquis of Salisbury, the Earl of Normanton and Captain Gaussen.

An interregnum in bookbinding, as in every other fine art, occurred during the civil wars in England, and the Restoration is marked by the work produced by the second great English bookbinder whose work is known.

In June, 1660, the office of "Royal bookbinder" was conferred upon Samuel Mearne, who died in 1683. The finest of his books were bound for the king, as might be expected, and these have always some royal heraldic mark upon them, often consisting of two interlaced C's crowned, between two palm branches; they are either in red or dark blue morocco. Other of his volumes are charmingly tooled in compartments with delicate pointillé fillings, after the style introduced by the great French binder, Le Gascon. Mearne invented what is known as the "Cottage style" of decoration on a book. Books

ornamented in this way have the lines of an inner panel amplified at each end, upper and lower, into the outline of a gable roof. The lines composing this gable are usually stained black, following again the lead given by Thomas Berthelet, and the spaces that remain are often very richly filled with festoons and masses of very delicate and beautiful gold tooled work executed with small, very finely cut stamps of peculiar designs.

The simpler books bound by Mearne have an inner panel outlined in gold with fleurons or other ornamented designs at each corner. The leather he used was the finest morocco, with a smooth surface. The gilt edges of the finer books bound by Samuel Mearne are sometimes ornamented in a remarkable manner. They are painted in water-colours under the gold. This painting was executed when the leaves were fanned out, then, when finished, the gold was applied as usual. The result is that often enough these painted edges have remained unseen for centuries, as they only show when held in a particular way. Mearne was the first binder to use this kind of ornamentation; he was followed in it by his son and successor, Charles, and, after some interval, by James Edwards, of Halifax.

The influence of Samuel Mearne's art was directly felt for a very long time, and, to some extent, remains with us to the present day; and although he founded much of his work on French models, he ultimately developed a style of his own of which we may well feel proud.

The decline in the art of bookbinding which occurred in England from the death of Samuel Mearne until the coming of Roger Payne, about 1770, would have been worse than it was if it had not been for the long continuance of the styles used by Samuel Mearne. Nearly all the better work done during this time owes what excellence it may possess to his initiative, the cottage style particularly remaining with us, and lending itself to all sorts of modifications and amplifications, many of which are very good.

Among our more original designers must be mentioned Elkanah Settle, a most remarkable man in many ways, eccentric to the last degree. He lived during the latter half of the seventeenth century, and is known as the "City poet." He wrote poems addressed to various people of note, many of which he presumably bound himself and ornamented with heraldic designs and decorative borders. The leather he used was generally bad sheep's skin, sometimes calf, and the ornamentation is done in gold tooling in a rough and ready manner, the various bearings on the coats of arms and the small pieces at the corners being laboriously stamped one by one, colour being added now and then. Although the actual finishing of these books is very faulty, they are not by any means unpleasing generally, and I think they are likely to be more appreciated and valued as time goes on; they certainly have a strong personal interest, as each one is made for some particular patron. The binders of Little Gidding and Elkanah Settle are the only instances in the history of English bookbinding where amateur work has made any lasting mark.

The trade bindings came much to the front with the skilled work done by, or for, Eliot and Chapman. These binders worked for Robert Harley, Earl of Oxford, in the eighteenth century, and used ornamental centre pieces and broad borders. Several books are curiously ornamented with small, finely-engraved stamps cut in emblematic designs by Thomas Pingo, the medallist. These books belonged to Thomas Hollis. They are not uncommon; the leather is usually fine, smooth red morocco, the ornamentation is more curious than beautiful, and is best when there is not much of it.

Towards the end of the century, a bookbinder of the name of Roger Payne came from Windsor and set up in London. He was at first apprenticed to Osborne, a Holborn bookseller, but somewhere about 1770 he set up for himself. He was very poor all his life and addicted to drink, but in spite of these drawbacks his original genius for the ornamentation of books showed itself with such effect that he not only produced some of the very finest English bookbindings existing, but has had a greater influence on the art in England than any other binder except Le Gascon.

Bookbinding is essentially an imitative art, and Roger Payne undoubtedly studied the best work both of Samuel Mearne and Le Gascon. Many of his smaller stamps are copied from one or other of them; but they are always modified, and the general arrangement of his masses of gold work is quite his own.

Most of Payne's books have large ornamental corners worked with very fine stamps, circles and dots, and many of them have ornamental doublures, or insides to the boards. His books are usually sewn with silk, and the backs strengthened with supplementary pieces of leather, making them very strong but stiff to open. His favourite leather was smooth or straight-grained morocco, but often he used russia, an excellent leather to take the impression of the stamps in gold, but a very bad one for lasting. It is said that Roger Payne cut his own stamps—often in iron—and this is likely enough. The gold tooling on most of his books is excellent, bright and strong, and has most probably been regilded several times. He took the greatest interest in each book he bound, and very often added a careful note in his own handwriting saying what he had done to the work and what stamps he used, many of them being, to some extent, chosen according to the subject.

Payne towards the end of his life (he died in 1797) took Richard Wier to be his partner. Wier drank as well as Payne, but nevertheless he and his wife were the first binders in England to study and practise successfully the difficult art of mending and repairing paper. This is now a very important branch of the binder's profession, and it is one that is likely in the future to be of even more importance than it is at the present moment. When much of the paper used now arrives at the stage when mending is necessary, it will tax all the ingenuity of the chemists and paper-menders to the utmost to repair it in such a manner as to preserve the legibility of the printed matter in a satisfactory manner. Indeed already, in my own experience, the greatest difficulty occurs sometimes in quite modern books, which are much used, in the endeavour to keep them together. It is sincerely to be hoped that the endeavours of the committee which has lately been considering this subject will have some practical result.

James Edwards, a bookbinder of Halifax and an artist, who came to London about 1785, invented and patented a curious manner of rendering vellum transparent. He did this by means of pressure and soaking in pearlash, but no doubt there were other ways of producing the same result. He bound his books in white paper, on which he painted delicate designs in water-colours; over all these he placed his transparent vellum, which acts as a complete preservative, so that if the vellum is not torn the paintings under it are as fresh as if done yesterday.

Edwards and another binder, John Whitaker, often used what is known as "Etruscan" designs on their bindings. The Greek fret and classical vases are the most easily recognised of these. Whitaker used with great success the darkening effect of a strong solution of soda upon pale calf. He made stencil-plates and sprinkled the soda through the spaces as required, or actually painted it upon the leather. Some of his bindings are very delicate in graduated browns and pleasing in effect. On some of Edwards's finer books the edges are painted in the same way as Samuel Mearne's. Edwards in all probability did this work himself, and on his books it is always very delicate and pretty. It was imitated to some extent afterwards, but never very extensively, as it is troublesome to execute. It often is found on the edges of small books bound in vellum, where its existence has not been suspected.

The remaining English bookbinders of the eighteenth century, several of whom went on into the beginning of the next, were nearly all close imitators of Roger Payne, but being better workmen their productions are more highly finished and more accurately tooled; in the trade much more admired. At the same time the artistic value, which is so marked in all Roger Payne's work, is wanting in most of the bindings done by Kalthoeber, Charles Lewis, Charles Hering, Walther and others. Charles Lewis was, perhaps, the best of these. He bound well and largely for the Right Hon. Thomas Grenville, and his books are most easily known by the peculiarity they usually possess of broad flat bands on the backs. They also often have excellent decorative work inside the boards. These binders used sometimes tickets in their bindings, and sometimes their names gilded in small letters on the leather.

ART IN BENIN.

A PAPER was read before the British Association by Mr. C. H. Read, which was illustrated by a series of lantern-slides, on "Ancient Works of Art from Benin City." He pointed out that the position of Benin near the great waterway of the Niger had brought it into contact with influences from the north by means of the great trade routes that diverge towards the north from such trading centres as Timbuktu. It was thus possible that here might be found some relics of the ancient civilisations of the Mediterranean, an opinion held by the late Sir Richard Burton. Relations with Abyssinia were founded on the journey of a Franciscan friar from the neighbourhood of Benin to Christian Ethiopia in the fourteenth century, and some corroboration of this was found in the Benin tradition that the king was subject to a powerful prince far to the east. In the hope of finding evidence of these traditions in the loot that came from Benin, Mr. Read said he had made representations to the Government, with the result that a large collection of ancient examples of Benin art had been secured for the British Museum, though it could scarcely be said that they had any direct bearing on the relations of Benin with either the extreme north of Africa or the east. A document of great interest bearing on their origin was a report by Sir Ralph Moor, giving the account of a palaver with seven natives, the Court historian, three Ju-ju men, the master smith, the master wood-carver and the master ivory-carver.

NOTES AND COMMENTS.

There used to be Irish archæologists who maintained that the round towers were of Indian origin, and that the Blarney Stone came from India viâ Tyre and Carthage to Cork. It is a pity those learned worthies could not have had the joy to behold the figure of Buddha which was described to the British Association on Monday. Like so many strange things, it was taken out of a bog. In this case the place of deposit was about fifteen miles from Kells, and was therefore in Leinster. There was some reclamation, for the image was found by a labourer while endeavouring to secure a foundation for a cottage. It is one of the Cingalese types of Buddha. Bogs are admirable places for concealing objects, but it is not easy to discover them afterwards. Sir John Evans considered the image, like many other stolen things, was cast into the bog by a robber who was hard pressed in pursuit. That is a very likely theory. It is not probable Buddhist missionaries brought the figure to Ireland. They might be glad to wander to west, but the variable climate of Western Europe would be an obstacle to their peregrinations.

An American judge recently laid down the following conditions as necessary to be observed by architects who wished to recover their fees in a law-court:—A person who holds himself out to the public in a professional capacity holds himself to be possessed of average ability in such profession, and the law implies that he contracts with his employer (1) that he possesses that requisite degree of learning, skill and experience which is ordinarily possessed by the profession in the same art or science, and which is ordinarily regarded by the community and by those conversant with that employment as necessary and sufficient to qualify him to engage in such business; (2) that he will use reasonable and ordinary care and diligence in the exercise of his skill, in the application of his knowledge, to accomplish the purpose for which he is employed; (3) in stipulating to exert his skill and apply his diligence and care, an architect, like other professional men, contracts to use his best judgment. In the case in question the plaintiff, who was an architect, depended on a verbal agreement. The owner of the building said the architect offered to do the work of preparing plans and specifications without charge, because he considered that as a beginner it would help him if he were able to say he had designed an important building. The defendant also said that the plaintiff's work was faulty, defective and unskilful. The judge, however, charged in favour of the architect, and the jury obeyed him. The defendant appealed to the Supreme Court, where it was held that all that is required in such a case is the exercise of ordinary skill and care, and that the responsibility of an architect does not differ from that of a lawyer or physician. The verdict was therefore upheld.

Some physiologists believe that one of the causes of the greatness of Great Britain is to be found in the mixture of races among the inhabitants. A man who is useful can find a place to exercise his ability no matter where he comes from. That the same principle was acted on in Mediæval times is shown by an examination of the vaults of the church of St. Werburgh in Bristol, which unfortunately has been removed. Dr. Beddoe, who made the investigation, says he found the Mediæval skulls were somewhat short, broad, and, if anything, low, flattish, rounded, with rather small frontal region, but otherwise well filled. The more modern skulls from the churchyard were mostly of quite a different type. They were generally rather large, longish crania, nowise distinguishable from those on the shoulders of their neighbours in Somerset and Gloucestershire. He was disposed to attribute the difference in the skulls to the presence in the earlier or Mediæval series of a larger portion of French blood. For centuries after the Norman conquest natives of France continued to filter into this country. Dr. Beddoe believes the French population in Bristol was 20 per cent. in the time of Edward II. As a reason for the disappearance of the round type Dr. Beddoe conjectures that the conditions of life in Mediæval cities being unfavourable, mortality was excessive, and when Aquitaine was lost the influx of the French was cut off. Welshmen came to settle in Bristol under the Tudors, and people came from Somersetshire and Gloucestershire. The same processes had continued ever since, although there had been more recently a slackening of the influx of people from Wales.

The American Consul at Antwerp is to be pitied. To him the privilege was granted to receive and take care of the preliminary designs sent in for the Californian University, of which Mrs. Phœbe Hearst is the endower. It was arranged by the regents that the plans were to be submitted enclosed in tin cases of uniform size, but when, says *Architecture and Building*, the cases of all shapes and sizes began to pour in on the Consul he grew alarmed, and when one came in a piano box he gave up in despair. As no bank in the city could be found willing to house the plans, the commissioners in charge finally hired a building. The date for the meeting of the judges who are to pass on the plans is September 20.

A lease has been granted to the American Institute of Architects of the Octagon House, Washington. "Lobbying" is indispensable in the States, and architects, like other professions, must accept it. In Washington they will be in touch with Congress. The building was designed by Dr. William Thornton, a West Indian, for Colonel John Tayloe, a wealthy and influential gentleman. It is English in style with the exception of the plan, and was completed in 1800. The Octagon House is leased at an annual rental of 360 dols. for a term of five years, with the privilege of renewal for an additional five years at an annual rental of 500 dols. It is agreed, however, that if at any time during the continuance of this lease the owners desire to sell the premises, they shall first offer them to the Institute at the same figure that they propose to accept from any other purchaser. Should the Institute not decide to purchase the property, then the owners are at liberty to sell it, the Institute having to remove within ninety days. If the sale of the property shall be effected during the first two years of the lease, the owners will have to refund to the Institute the sum of 3,000 dols., provided the repairs have cost that much; if during the third year, the cost of the repairs less 30 per cent.; if during the fourth year, the cost of the repairs less 40 per cent., and so on at a reduction of 10 per cent. per annum during the entire ten years of the lease should the lease be renewed for an additional five years; but should it terminate by limitation, and no sale of the property be made, then no return shall be made by the owners on account of repairs.

The village of Redland, near Bristol, contained several Elizabethan houses which were much admired by strangers. It is believed that during the Civil War they were occupied by officers of both armies, one being Prince Rupert. Two of the houses, called Richmond House and Grenville House, but which formerly were known as the Manor House, were lately sold. According to a correspondent of the *Bristol Times*, there are in Richmond House seven arches, two panelled rooms and one mantel carved in Elizabethan style. The front door is of massive oak, banded and studded with iron, that in Grenville being the postern door but of similar make and style. Almost precisely the same work and finish are to be found in Dartmouth Church door, near Torquay, with date 1611. At Grenville House are the original oak staircase and two bars, which fall back into deep sockets in the wall. They are of great weight and thickness. The buildings are to be demolished, but Mr. C. H. Tucker of Bristol, the new owner, says it is proposed to retain and preserve one of the old carved mantelpieces, some of the ancient doors and wainscotting as well as other portions of this locally-historical property. Up to the 29th inst. the houses can be inspected by those who may care for ancient architecture.

ILLUSTRATIONS.

CATHEDRAL SERIES.—SOUTHWELL: CHOIR, LOOKING WEST.

REREDOS, KINGSTON VALE CHURCH.

THURSTONVILLE, BECKENHAM.

CHURCH OF ST. ETHELWOLD SHOTTON, IN HAWARDEN.

THE foundation-stone of this church was laid by the Hon. Mrs. W. H. Gladstone on Wednesday, September 14.

The first subscriber was the Right Hon. W. E. Gladstone, who, having regard to the rapidly growing population of the district (due in a great measure to the development of the neighbourhood by the new railway, of which he cut the first sod and afterwards inaugurated by opening the "Hawarden Bridge"), gave 1,000*l.* as the nucleus of a fund for erecting, in place of the school-chapel built twenty-five years ago, a new church, desiring that it should be "a beautiful building and available equally for all."

The district lies along the Dee between Connah's Quay and is steadily growing. Recently the large and increasing ironworks of Messrs. Summers and other industries springing up have brought, and will bring, numbers of workpeople from the towns in Lancashire and other counties.

Plans have been prepared by Messrs. Douglas & Minshull, Chester, and a contract for 4,700*l.* (exclusive of the north aisle and tower) let to Messrs. J. Ward & Sons, Uttoxeter. Further expenses, including site, will amount to upwards of 1,000*l.*: 2,800*l.*, with grants, have already been raised in and near Hawarden parish.

The bankers are Messrs. Lloyds Bank, Limited, Hawarden.

Any contributions will be gratefully received by the rector, Rev. S. E. Gladstone, or the churchwardens, Messrs. C. B. Toller and J. Wilcock, Hawarden, near Chester.

SOUTHWELL MINSTER IN 1806.

IN 1806 John Carter, the architect, visited several churches in Lincolnshire, Nottinghamshire and Yorkshire, partly to make drawings of the buildings for publication, but mainly to gratify himself by the sight of Gothic examples which he was never tired in admiring. The following are the notes he jotted down about Southwell:—

The town itself has not anything worthy of notice, therefore attention must be solely directed to the collegiate church, founded 630, being the earliest date, St. Augustine's, Canterbury (605), excepted, we have on record of a building among us now in existence. The church has sustained little alteration otherwise than in some of the windows, which have given place to the pointed ones of the fourteenth century. I own my notes on this fabric were taken not in that general way I could at this time have wished; as surely there are (taking into consideration the very remote date) many particulars of the strongest import. However, I submit my remarks, trusting a second visit (in preparation) will fully recompense the present deficiency. In the surrounding wall of the religious mound and on the north side is a pointed gateway with reducing parapets; the opening has been stopped up. At this spot in point of scenery this gateway occupying the foreground and the chapter-house and north side of the church seen beyond it, has a very picturesque effect. On the west side of the surrounding wall is another gateway, Saxon, and of the plainest architecture, well impressing the belief that the general works here were raised in the sixth century. The parts of this gateway are plain jambs and an abacus supporting a semicircular arch with two fascias by way of architrave. Above the head of the arch has been fixed, probably in the fourteenth century, a recess, with an ogee head (statue gone). Through this gateway a direct view is had of the west front of the church, the chapter-house on the left and some ruined monastic buildings on the right. It is hardly necessary to say the appearance of this scene is at once striking and grand, venerable also from thought, that for more than a thousand years this picture has lasted.

West Front.—Made out by two lofty square towers parcelled off into seven storeys and decorated with windows and arched recesses. Between tower and tower in two storeys is the west doorway and great window. The towers are capped with lofty square spires quite plain; these square finishings I conceive to be far more ancient than those we commonly witness in octangular forms; perhaps they are not coeval with the towers, yet still they have at present their interest in man's eye. The west doorway, two large windows in the towers and the still larger one in the centre of the front, are, as above stated, late insertions, having pointed heads and much tracery work. Over the centre window are battlements, another departure from the first design, which is Saxon, and in its purest dress.

North Side.—Taking in the transepts it is constructed in five storeys; between the windows, breaks or pilasters. The upper storey has remarkable circular windows; the elevation terminates with a parapet, being its own proper completion. The porch on this front is in strict unison with the rest of the parts. The great centre tower is rather low. My judgment may be at fault in this respect, the exceeding lofty towers pressing on the sight in every district of the land must be my apology if I err in this decision. This tower has two tiers of recesses, proper parapet, &c.

The chapter-house (on the north side of the church), in plan is an octagon, bearing strong resemblance to those of Wells and Salisbury. The ruined buildings mentioned in the general view are sumptuous, having large and rich traceried windows. Here are some peculiar chimneys, the tops of which are devised into small chapels, with windows for the dismissal of smoke, &c.

I must again express my concern that memory alone can in anywise help me to say aught about the interior of the edifice with reference to the architecture in the elevations, &c.; but if that faculty of the mind can be depended on I may venture to affirm, the columns, arches, the galleries, windows, groins, mouldings and ornaments are truly genuine and full of that infinite variety that peculiarly characterises and which, perhaps, gives to Southwell a celebrity that cannot be found in any other fabric.

However, that I may not leave this curious church without note of some remarkable remains, I shall with much satisfaction comment on the avenue leading from the church to the chapter-house. The dado parts below the windows have recesses with columns and arches enriched with costumic heads. The pointed windows have pleasing tracery and the groins are light and beautiful. The double entrance into the chapter-room is replete with grace, the ornaments belonging thereto are many and excellent in their kind. Among the above costumic heads are a king, a queen, a bishop, ladies of various degrees, heads of eminent men, &c., the whole collection marking the age of Henry II., as doth the architecture also.

There is another subject which must be minutely described; indeed, panegyric might be exhausted on its merits, and it may be surmised (not without reason) that I was so fascinated with my memoranda that I even forgot and neglected the prime characters of the interior itself. You then that dwell with more than common satisfaction at mention of the architecture of our third Edward's day, hear. The screen entering into the choir

owns the pride of that meridian hour of art. The work to the nave has three large openings in arches, with columns and slender buttresses between them; at each end of the design are appropriate recesses. The several arches are bounded by pediment finishings and a suitable entablature completes the whole. The interior of this screen (adequate description fails me) returns the work of the exterior arches, composing a kind of cloister of three divisions. The ends, north and south, full of the richest and most delightful tracery. The groins, in their ever-consummate proof of ancient geometrical power, are here constructed in a way peculiar to themselves; there are no spandrels to the ribs, they being left to seek their pointed flight independent of any such seeming assistance; in the diagonal line behind the ribs there is open tracery filling in that narrow space. Nothing can exceed the lightness and, it may be said, the magic touch of these vaulted bows. In the front next the choir the principal portion of the design is carried on, and with increased embellishments. The centre arch corresponds with that on the nave front, the spaces right and left are divided into three parts each and into two storeys. The lower storey contains three small arches on each side, the internal work groined and serving as stalls for the dignitaries. The storeys above form galleries with open compartments that are glazed, &c. The minutiæ of mouldings and ornaments are delicate and rich to excess. In fine, this screen may be held as one of the gems of ecclesiastical decoration in this part of the north; a jewel most worthy to be prized, and by those men of taste and discernment who have, to the high honour of this church, so long kept it unsullied and free from all dilapidation or more fatal improvement.

Ye despoilers of Edward's architectural glories, if ever you chance to stumble on this refulgent piece of workmanship, be tender, be merciful; and as some retribution for strokes already inflicted, touch with a gentle hand, your eyes blessed with a new sight, this trembling remains; and should you (which science by her protection permit) see aright, have pity on its matchless properties, and let it still endure. An age to come expects it, therefore once more have mercy.

SOMERSET ARCHÆOLOGICAL SOCIETY.

(*Concluded from last week.*)

Excursion to the Moors.

WEDNESDAY was devoted to an excursion to the moors lying to the east of Taunton, including the parishes o Ruishton, Creech St. Michael, North Curry and Stoke St. Gregory. A start was made at 9.30, about a hundred members taking part in the excursion. The brakes and other vehicles were supplied by Messrs. White & Co., and were turned out in a well-appointed manner. The weather in the early morning was somewhat threatening, but the sky speedily cleared, and a really lovely day followed, the sun shining brilliantly and a refreshing breeze blowing.

Ruishton.

Ruishton was the first place visited, and here the party visited the church. Mr. Buckle drew attention to its charming little tower. They would notice that its general character was similar to a great many round about that part, and particularly it was very like St. James's, in Taunton, and Bishop's Lydeard, only on a smaller scale, and it happened to be in quite a different coloured stone, because there it was built of blue lias, whereas in Taunton they were built of red sandstone, in each case with Ham stone dressings. One remarkable thing was the smallness of the tower and its very small height, while at the same time they had such magnificent and effective richness. The tower was treated in an extremely bold way, although the storeys were not higher than ordinary rooms. It was a remarkable tower in another respect, because they happened to know its date, for in Mr. Weaver's wills they found money left in 1530 and 1533 for its building. Considering the lateness of the date the building was in very pure style, there being nothing to suggest that it was absolutely at the end of the Perpendicular period. The tradition was that the tower was never finished, and this seemed exceedingly likely, but at any rate the parapet and pinnacles were missing now, and if they were ever put up they must have been taken down. There was the fragment of a cross in the churchyard, and at the corner of the church there was a stone on the coign carved with the figure of a priest in the act of benediction. Coming to the interior, Mr. Buckle pointed out the fragment of a Norman doorway. They had parts of the church which went back to a very early period. The chapel and the walls of the chancel were of the Early English period, probably the twelfth century. The east window of the chapel was very charming, and possessed some beautiful tracery. All the rest of the church was, as usual, Perpendicular. They might notice how curiously the church was planned, the chancel being completely out of line with the nave. Mr. Buckle pointed out the doorway leading from the chancel to the chapel. The font was a very remarkable example, and was richly carved all over. In front of the reredos was a beautiful picture, of which he would be glad to hear the history.

Prebendary Askwith said there was a tradition that during the last century the picture was presented to the church by a member of the family of Mr. Murray-Anderdon, of Henlade.

Creech St. Michael.

The party were next driven to Creech St. Michael, where they were received by the vicar, the Rev. James Bownes. Mr. Buckle said that at a first glance they would be inclined to say that that was pretty well a thoroughly Perpendicular church, with the exception of the arches which they came in by, but the contrary was the fact. Almost the entire walls of the church were of the twelfth century, and the large nave was of that date. The transept on the south side did not belong to the early church. In the tower two of the arches were Early English, while that leading into the aisle was a Perpendicular arch, which was knocked through when that aisle was added. The upper part of the early tower remained, but above that a Perpendicular belfry had been added, as was often the case. The Perpendicular lines were very clear all the way round. The most remarkable feature of the chapel on the north was a gallery in the thickness of the wall, from which there was an entrance to the rood-loft. There was a great deal that was very rich about the Perpendicular work there, and there were two very nice niches, besides some elaborate work leading into the transept. The roof was very rich, and had elaborate carvings. A piece of the rood-screen remained, but it had been cut off just above the lower panels. The church contained a monument of the Cuff family. Outside over the west window was a figure of the Trinity. The stocks were still standing in the churchyard under one or two fine old yew trees.

The Rev. J. Bownes exhibited the communion plate and the registers, the latter dating from 1641, and during a discussion on the origin of the name of the parish, Prebendary Askwith suggested that it was derived from "Creek."

North Curry.

From Creech St. Michael the archæologists had a pleasant drive to North Curry, where the church, one of the finest country edifices of its kind in the country, was inspected with great interest by no means unmixed with admiration. Mr. Buckle, in describing its principal architectural features, called attention, first of all, to its remarkably fine octagonal tower. There were, he said, a good many octagonal towers scattered about Somerset—Stoke St. Gregory, South Petherton, Bishop's Hull and Pitminster—but in almost every case they were the work of the twelfth century, very early in the Early English style. Except that one, however, he did not think there was any example in the whole county of a tower of that style which was begun so late. There appeared to be nothing earlier in the church than the beginning of the fourteenth century—somewhere about 1300. The early church was inclined to be Decorated, and the principal part of the tower, the belfry storey and octagon, appeared to be later than that. But the piers and arches that remained in the centre of the church and the transepts were of the beginning of the Decorated period. Thus they had an example of a cruciform church with central octagonal tower at that comparatively early date. The church which was then built had no aisles, and the chancel and nave were the same size as at present. He called attention to the immense size and bold mouldings of the tower pillars, and pointed out that around the base of each ran a stone seat, which it was very unusual to find except in churches built on the cathedral scale. That church was often called the cathedral of the moors on account of its grandeur and of the way in which it overlooked the moor. The church was not built any great length of time before it became desirable to add aisles. The original aisles seemed to have been built about the middle of the fourteenth century, but they were not so lofty as those of to-day. The nave of the original church was the same size as at present, but it was by no means so high and was covered with a pointed roof. When the aisles were added clerestory windows were put in and the position of these windows may now be clearly traced below the present clerestory, while in two places they have been opened, after having been for some time sealed up. At the time that the aisles were added a porch in a rather curious position on the north side immediately to the west of the north transept was destroyed. The second enlargement appeared to have been a heightening, there being no addition to the church unless the south porch was entirely of that date. Outside the porch they would observe three niches. The original window of the south transept was still there, and at the east end of the chancel there were indications of the pointed roof. There were a couple of interesting monuments, one in the north aisle and the other in the chapel, while another striking object was a fine candelabra depending from the roof in the middle of the nave. In the churchyard at the time of the Dissolution there

was a chantry chapel, a separate building which must have been of considerable size and great elaboration. When the chantries were abolished the building materials of the chapel were valued at 15*l.*, which was a very large sum for that period.

Colonel Bramble then gave some particulars of the monuments. He said the one in the chancel would correspond with the Decorated portions of the church. It was an effigy of a civilian in the dress of the latter half of the fourteenth century, about 1360. It had on a long gown with tight sleeves coming to the wrists, over that other sleeves ending just below the elbow, and over that again a kind of tippet. There were a remarkable number of these effigies both in Somersetshire and elsewhere. This effigy had his head resting on a cushion, and at one time there was an angel supporting the figure, but the angel had all been cut away except one hand supporting the head and the other resting on the shoulder. With regard to the other effigy, the Vicar had asked him whether it had come from the Abbey of Athelney, but the fact that it was an emaciated figure, not a skeleton but a cadaver, did not necessarily imply that it came from a monastic establishment. It was the fashion in those days to represent persons in the same way as they were when lying in the tomb. Underneath the effigy were figures dressed as friars telling their beads. It might or might not have come from a monastic establishment.

The Vicar (Prebendary Buller) was next called upon, and he stated that the monument in the chancel had an inscription upon it, which was either John or Thomas of Slough—that was, Slough Farm. He found in the register that Bishop Ralph, of Shrewsbury, in January 1337 gave two licenses to John of Slough, of North Curry, to have divine service celebrated in his oratory at Slough for a year. That effigy might represent the same person.

Mr. Buckle stated that there was a modern reproduction of an old Norman doorway in the north aisle which he had forgotten to mention.

The old parish registers and the communion vessels were then inspected, and there were also shown a couple of pewters which were in use in public-houses at the time of the Commonwealth, and which were introduced into the churches by the Puritans, who wished to show their disregard for the sacredness of ecclesiastical things.

Luncheon at Moredon.

After the inspection of North Curry Church the party proceeded to Moredon, the beautiful residence of Major Barrett, J.P., D.L., where, by the kind invitation of Major and Mrs. Barrett, they partook of a *recherché* luncheon, served in the ball-room.

Slough House.

The next place *en route* was Slough House, which, by the kind permission of the owner, the Hon. H. P. Gore-Langton, and of Mr. Thomas Hembrow, the tenant, was thrown open to inspection. The building is in a very good state of preservation, and it has all the proportions of an Elizabethan manor-house. The party, or as many as could get into one of the principal rooms, having assembled, Mr. Buckle proceeded to give a description of the building. He said that the room in which they were gathered was the hall of the house, and they would have noticed as they came in that the porch had a beautiful facing of stone in alternate courses of blue lias and Ham Hill, which made altogether a very charming variety of colour. On entering the porch they passed through a screen of timber, and afterwards they found themselves in another narrow passage before entering that room. That screen was originally the end of the hall, which it had been found convenient to reduce in size. The house was of the sixteenth century, and the style of the architecture was Gothic. Instead of having a large open roof, the upper part of the house was devoted to rooms, and thus in the room in which they were they were able to get that fine timbered ceiling. At the principal end of the hall they would have expected to find bay windows, but instead of that there were flat ones between two pillars. There had, however, been a bay window. In a recess they would notice a square bay of the hall, and in that bay was a cupboard which originally contained a flight of steps going downward and turned round to the left, passing through a door. Where the door led to he could not say, but it was suggested that it led to the moat, or it might have led down to a cellar.

Mr. Hembrow, the tenant, showed a portion of carved stonework which was discovered in a wall of the building during some repairs and was considered to have been part of the ancient oratory which was formerly there.

Mr. Sloper made a few remarks concerning the stone, and gave it as his opinion that as Athelney Abbey was so near by, it formed a portion of the stonework of the abbey, and was removed after it was destroyed. The present building never was a manor-house, but it was pleasing to see that it had been so well preserved.

The Rev. H. F. S. Gurney, vicar of Stoke St. Gregory, expressed his opinion that the house had a history as far back as King John, and there were formerly a Jack of Slough and a Jack of Knapp who had to provide a feast in accordance with the customs of the manor.

After the inspection, Colonel Bramble, on behalf of the Society, thanked Mr. Hembrow very cordially for his kindness in allowing them to visit his house, and Mr. Hembrow, in reply, said he was very pleased to have had the opportunity of letting the members see it.

Stoke St. Gregory Church.

The party were next driven to the church of Stoke St. Gregory. Mr. Buckle said the building was in many respects similar to the church at North Curry, but the foundation of Stoke St. Gregory was considerably older. Here the octagonal tower was of the date when one expected to find them. The edifice at Stoke St. Gregory was originally of the latter half of the twelfth century, but it had been altered since. The original church, like the one at North Curry, was of cruciform shape, with single nave and no aisles. This church might be regarded to some extent as the one from which the builders at North Curry took their design, although they might have brought more skill to bear upon it and had more funds to work upon. The nave at Stoke St. Gregory was wider than the transepts, because the builder wanted to get a true octagon, and in order to do so he had to get a true square base. Underneath the tower they could see the form of the octagon. The arches had no capitals, but they had most remarkable bases, which, when uncovered at the restoration, turned out to be English capitals upside down. It was a great conundrum how they got in that position. It would be observed that the whole of those arches were built of Ham stone, whereas the upper part of the tower and upper ring of the side arches were built of the native stone—a very beautiful grey sandstone. It had been suggested that at some time or other the arches had been taken down and re-erected with Ham stone. In the south transept there were two arches and two windows complete of the early period, but he thought beyond that there was nothing left of the original twelfth-century building. The addition of the aisles was the work of the latter part of the fifteenth century, and the whole of the present architectural features, with the exception of those he had mentioned, belonged to that date. It was interesting to note that on the south side of the church there was an altar tomb with quatrefoils round it, and upon the centre panel of each nave were the Montacute arms with the initials "J. M." Of the furniture of the church the font was perhaps the most remarkable feature. It was an octagonal font with quatrefoils worked round it, one on each face, which varied from side to side. Excepting that they were ingeniously worked, he did not think anybody could say it was a beautiful font. A good many of the bench ends remained, and the pulpit was a very interesting piece of carved woodwork, the figures thereon representing Time, Faith, Hope and Charity, on each of which the symbols were very strongly marked. There was another figure remaining with face turned towards the east, but it was extremely puzzling to know what that represented. A large reading desk formerly stood in the church, but it had been taken away, and Mr. Gurney had converted it into a vestry cupboard. It was a curious piece of work, with figures of women thereon with something in their hands. What those things were did not appear quite clear, but they looked like carvings of dust-pans. Mr. Gurney said he thought that they were oil-lamps. In the vestry was also a picture, very common in churches, of David with his harp, which used to adorn the singing gallery. In conclusion Mr. Buckle drew attention to the stocks which could be seen in the churchyard, under a yew tree, as at Creech St. Michael.

The Rev. H. F. S. Gurney afterwards showed the church plate and the registers in the schoolroom.

Thornfalcon Church.

Leaving Stoke St. Gregory Church the party repaired to the small but picturesque church of Thornfalcon. Here they were met by the Rev. J. D. Bailey, the curate-in-charge, and Colonel Bramble, in the absence of Mr. Buckle, gave some particulars of the sacred edifice. It is a fourteenth-century church, with reticulated windows with quatrefoils. There used to be a rood-loft over the entrance to the chancel, extending along the top of the screen, and the marks where the screen had been fixed were still visible. There being no clerestory a window had been put in on the north side almost parallel with the screen to light the rood-loft. On the other side another window had been put in to light the pulpit. There were several interesting bench ends, and the dates had been carved on some, one being 1542. Just inside the entrance to the doorway was a holy water basin; and inside the church on the south side was a kind of niche, almost resembling an almonry, but the purpose of which is not known.

More time could have been profitably spent in inspecting this interesting little church, but the members were beginning to feel the demands of appetite, and an invitation by Majo

and Mrs. Chisholm-Batten to partake of tea which they had provided on the rectory lawn close by was accepted with pleasure. Tea over, and Mr. E. J. Stanley, M.P., having, on behalf of the Society, thanked Major and Mrs. Chisholm-Batten for their kind hospitality, the journey home was commenced, Taunton being reached about seven o'clock, thus bringing a very interesting and enjoyable excursion to an end.

Conversazione.

In the evening a conversazione was held in the Castle Hall, and there was a very good attendance, Mr. Stanley, M.P., and the Bishop of Clifton being among those present. Mr. F. W. Baker's Taunton quadrille band was engaged for the occasion, and played an admirable selection of music in excellent style. Songs were given by Mr. Frank White and Miss Barnicott, and the remainder of the evening was devoted to conversation among the members.

A Visit to Exeter.

Thursday was devoted to a visit to Exeter, where an inspection was made of several buildings of interest to the antiquarian and all lovers of the beautiful. The party, which numbered about 150, journeyed from Taunton by a special train consisting of saloon carriages, and Exeter was reached about half-past ten, after a run of forty minutes. The weather was of a delightful character.

Reception at the Guildhall.

The large party first proceeded to the ancient Guildhall, where they were received by the Right Worshipful the Mayor (Alderman R. Pople) in state.

The Town Clerk described the principal features of the Guildhall, which was built in 1330; gave particulars respecting the swords and cap of maintenance presented to the city by King Edward IV. and King Henry VII., which were exhibited for inspection; produced and explained some of the forty-eight royal charters, going back to the reign of Henry II., as well as some of the 2,000 deeds belonging to the city, and showed the common seal of the city, which has been in use continuously for more than 600 years. He said he was told some time ago that the common seal used by Taunton was very similar to the seal used by Exeter, and some people were ill-advised enough to think that it was a reproduction. The late Mr. Meyler, town clerk of Taunton, kindly sent him an impression of their seal, and he had compared it with that of Exeter. The same man probably cut both seals. The Taunton seal bore the words "Sigillum communæ" and "Borough of Taunton," while the words on the Exeter seal were "Seal of the City of Exeter." The Taunton seal exhibited an abbot's mitre and crozier, while on the Exeter seal were simply two keys.

The party afterwards visited the Council's committee-room, which contains a number of old portraits.

The Bishop's Palace and Cathedral.

On leaving the Guildhall the visitors were taken by Prebendary Bramley through the grounds of the bishop's palace, from which a lovely view of the cathedral is obtainable. They then visited the cathedral, the history and leading characteristics of which were narrated with customary ability by Canon Edmonds, who also exhibited some of the ancient muniments belonging to the dean and chapter. The visit to the cathedral lasted quite an hour and a half, but the time spent in the grand old building was all too short, as Canon Edmonds's description of it was of a really charming character. His love of the building is well known, and it is a delight to hear him point out its beauties. He remarked that the cathedral owed a great deal to a Somersetshire man, Bishop Bitton, who came from Wells. Wells Cathedral was a little earlier than Exeter, but the construction, the transformation and the lengthening of the two edifices were commentaries one upon the other.

Other Antiquities.

Leaving the cathedral, the visitors had an opportunity of seeing Mol's Coffee House, built about 1569, and said to occupy the site of the College of Annuellers or Chantry Priests attached to St. Peter's Church and St. Martin's Church. Luncheon was partaken of at the New London Hotel, and subsequently the visitors inspected the castle (the ancient Rougemont), St. Pancras, St. Mary Arches and St. Mary Steps churches, and returned to Taunton by train, leaving St. David's at five o'clock.

The visit was most enjoyable.

Amongst the members present at the meetings of the Society was Mr. L. H. Ruegg, who was present at the first meeting fifty years since and reported the proceedings and the speech of Dr. Buckland, to which admiring reference was made by Mr. Hobhouse. A printed copy of this report, cut from the *Sherborne Journal*, was sent to the museum, but unfortunately miscarried, or the Society would have seen the report and the reporter of fifty years ago.

The fourth and concluding day's proceedings commenced on Friday morning, when a numerous party, in four large brakes, started from Castle Green, visits being paid during the day to Norton Fitzwarren, Cothelstone, Bishop's Lydeard, Lydeard St. Lawrence and Combe Florey. The weather was of the most favourable description, and the excursion throughout proved very enjoyable.

Norton Fitzwarren Church

was the first stopping-place, and in the course of a lucid explanation of this edifice Mr. Buckle, the diocesan architect, said the walls of the church were for the most part modern, but as to how far they were reproductions of the old work he could not say. The chancel, at any rate, was entirely modern, but with regard to the windows the probability was that they were reproductions of the old ones. The arcade separating the nave from the aisle was apparently originally thirteenth-century work, but it seemed to have been considerably altered, and he should think it was at one time pulled down and rebuilt. The tower, however, was part of the original work. The great features of the church so far as the building was concerned were the tower and screen. The former was of very great grandeur, and was, so to speak, a straggler there, as it was a sample of the West Somerset tower. Those solid massive towers were to be found all the way along the other side of the Quantocks, but here it seemed curious to find a tower of that type mixed in with the much richer towers of the sixteenth century on all sides. There was very little decoration about it, but there was a very remarkable niche head on the south side as well as three large gargoyles, which, however, were rather rudely carved. With regard to the screen, the figures over it were modern, but with the exception of that and the mouldings on the top of the cornice it appeared to be old and in an uncommonly good state of preservation. One of the mouldings, a grape vine, was, however, on a very coarse scale, and looked as though it would be much more suitably placed at the base of the roof. Just below this, however, was a very delicate succession of mouldings, and it really seemed to be a question whether the upper moulding belonged to the screen at all. Mr. Buckle next explained the figures in the mouldings, which he considered to be work of the beginning of the sixteenth century, and pointed out that in one or two places they appeared out of position, having evidently at some time been taken down and wrongly replaced.

The Rev. W. P. Hewett, the rector, read an extract from the *Church Times* upon the edifice as follows:—The screen at Norton is little known. Forty years ago a Protestant bishop ordered the original painting and gilding to be daubed over "a light oak colour." It has also suffered in other ways. When the church was defaced under the name of restoration it was entirely taken down, and only put back by the energy of the present rector, and this against the advice of most of the neighbouring clergy. It was pieced together in an entirely different manner in order to fit the new chancel arch, and has therefore lost much of its value. Its chief glory, however, is a wonderful series of animals carved on the lower side of the beam, and representing the devastation of a dragon or crocodile, its chase and final overthrow by a man armed with a bow and arrow. There is a most spirited piece of carving where the beasts follow the man home. The part representing the death of the dragon was stolen from the church, but was rescued by the rector from a curiosity shop in Taunton and replaced. The carving refers to a legend of a dragon having devastated the valley between Norton and Williton, finally meeting its death at Norton. The screen appears to be about 1500, and has on it the name of Ralphe Harris, who was churchwarden at the time, and was buried at the west end of the church, 1509 A.D.

Norton Fitzwarren Camp.

The company next made an inspection of the site of the old Roman camp a little distance above the church, and subsequently remounted the brakes and proceeded along the private road of Norton Manor by kind permission of the owner, Mr. Wilfred G. Marshall, to the Minehead main road, the next stop being made at

Cothelstone.

Here the first object of interest was the well-known Manor House, which was inspected by permission of Mr. C. E. J. Esdaile, the owner, and Mr. C. L. Hancock, the tenant.

The Rev. Wm. Esdaile, a brother of the owner, described the history of the Manor House, which he said belonged to the family of Stawell, who settled at Cothelstone at the time of the Conquest. The most distinguished member of the family was Sir John Stawell, who lived in the reign of Charles I., took part in the rebellion by raising three troops of cavalry and one of infantry in support of the king's forces, and also lived during the earlier portion of the reign of Charles II. He had a skirmish rather than a battle with Blake's forces at Bishop's Lydeard, and retired to Cothelstone, and the greater part of the mansion was then destroyed by Blake. Nearly the whole

of the right wing was destroyed, but was restored in 1855 by his (the speaker's) grandfather, and the restoration was generally considered to have been very carefully carried out in accordance with the house which Blake destroyed. Sir John afterwards had all his estates confiscated, and that place was destroyed, and he was cast into prison at Newgate, but he was subsequently released and again became knight of the shire, a position he had formerly occupied. Mr. Esdaile next read an account of Sir John's funeral, which was of a very elaborate character and an extremely lengthy one, and also mentioned that he had fourteen sons and three daughters. Upon the occasion of the Society's last visit to the place in 1854 the Manor House was in a dilapidated condition and was restored in the two following years.

Mr. Buckle, upon being asked to give a supplementary description of the building, said he knew very little about it, except that it was of a very unusual character. The general idea of the building was Tudor, and they had the same sort of base-course and string-course and wide mullioned windows which they got in the regular Tudor buildings. But they had associated in those features some most extraordinary ones. The buttresses were most extraordinary things, and the small bases they stood upon were just like the pedestals of a Classical column. Then on the top of that they had a shaft which tapered down to a very small size until it got to the string-course, the top of which was covered with an ungainly piece of carving. The finish at the top and also at a few other places was distinctly Classical. The very quaint gate-house they had just passed through was also distinctly Classical, and when they got inside this they found a couple of fine openings, which were of the purest Perpendicular. If they looked at the tablet with the coat of arms over the door they would see that, although the treatment of the heraldry was Jacobean, it was also enclosed in a flat four-centred arch of quite a Tudor kind. It was altogether a very remarkable building which formed a sort of link between the latest of Tudor work and the beginning of the Renaissance, but whether or not the whole building was of that date he could not say. It rather suggested that the house was really of an older date, especially on the outside where there was a chimney-stack which was very Gothic indeed in character and which looked to him as though the building might very likely have once been thoroughly Tudor.

Colonel Bramble pointed out that one of the pinnacles of the house consisted of a cannon-ball, which was fired at the house when it was destroyed.

The report is taken from the *Somerset County Gazette*.

THE FORTIFICATIONS OF TIRYNS.

THE walls of Tiryns are the grandest in the world. They excited even the enthusiasm of the usually sober Pausanias, and he was provoked that the Greeks, always more prone to admire what was foreign than what was their own, were perpetually speaking of the wonders of the Egyptian pyramids, and never mentioned the Treasury at Orchomenus or the Tirynthian walls, although these were objects quite as worthy of their admiration. Homer praises Tiryns not as "abounding in walls," but as well-walled. The Greeks called these old walls Cyclopean, because the possibility of their erection was a thing they could not understand, and they could only look on them with astonishment as the works of a race of superhuman giants. Historically these mighty structures belong to the Pelasgians, that enigmatic people of the remotest Greek antiquity jocularly compared by Aristophanes with the storks, because they wandered restlessly from place to place, and everywhere leave traces of their unwearying constructive activity. These walls are accordingly with justice also termed Pelasgic.

In itself the leading idea of this primitive masonry is very simple. It consists in laying stones, not unhewn or unsplit, but unsquared, unsmoothed, mostly polygonal, in courses deviating more or less from the strictly horizontal, piling these to the proper height without the aid of mortar or other cement, and filling up gaps and intervals with smaller stones. Masonry of this kind is found among almost all primitive peoples; there are examples of it in China, in Mexico, even in Alsace. But the marked and unmistakable distinction between the Pelasgic structures and all similar attempts of other peoples lies in the colossal size of the masses which the Pelasgians, and they alone, employ. The Pelasgic walls sometimes contain blocks from 10 to 11 feet long and from 5 to 6 feet in height. What a high development of mechanical skill does this presuppose.

Masonry of such a kind is indestructible; the larger the separate masses of material the more closely does the wall resemble the natural rock. Forschhammer, as his masterly treatise "On the Cyclopean Walls of Greece" shows, has, so to speak, rediscovered the art of constructing this primitive and ingenious masonry; it would even appear that at his suggestion an attempt, and a successful one, has been made in the vicinity of Kiel to introduce its principle into modern practice.

The walls here, as at Mycenæ, follow the natural outline of the hill; and here, too, the Acropolis has an outer and inner circle of walls. Certain "galleries," as they are usually called, are highly noteworthy. These are a sort of huge vaulted corridors in the interior of each wall, and their vaulting is again effected merely by the natural dovetailing of the stones, and altogether without cement. Two galleries are still in tolerably complete preservation. The largest is 84 feet in length, 5 feet in breadth and about 12 feet in height. It is in the inner wall; there is a second, only slightly less, in the outer; and probably, as we are entitled to conclude from existing remains, all similar rings of walls were hollowed out in the same way. No one knows what purposes these vaulted passages served. Were they magazines for weapons and provisions, or were they places of refuge? The probability is they were lurking-places, not so much for purpose of escape as for secret ambuscade, to allow of a sudden, unforeseen assault upon the foe, even when he had already penetrated into the fortress.

ELECTRIC RAILWAYS AND OBSERVATORIES.

IN the course of his address to the International Conference on Terrestrial Magnetism and Atmospheric Electricity at Bristol, Professor A. W. Rücker remarked:—

The rapid extension of electrical railways and tramways is a serious menace to magnetic observatories. From all parts of the world we hear of observatories ruined or threatened by the invasion of the electrical engineer. Toronto and Washington have already succumbed, Potsdam, Parc St. Maur, Greenwich and Kew are besieged, and the issue largely depends upon whether these great national observatories can or cannot make good their defence.

It seems to be a law of nature, ruling alike the human race and the humblest microbe, that the products of an organism are fatal to itself. The pessimist might infer that we are in presence of another instance of the universality of the application of this law, and that pure science is threatened by the very success of its practical applications. The smoke of our cities blots the stars from the vision of the astronomer, who, like the anchorites of old, flies from the world to mountains and desert places. It is only in the small hours of the morning when

> Save pale recluse, for knowledge seeking,
> All mortal things to sleep are given,

that the physicist can escape from the tremors of the traffic of a great town.

Civilisation as it spreads by aid of the means that science has placed at its disposal is destroying records and obliterating boundaries by the study of which the anthropologist and the biologist might have read far back into the history of our race. And now in turn the science of terrestrial magnetism, which, on the one hand, is forging another link to connect the sun and earth, and, on the other, is penetrating within the surface of the globe to depths beyond the ken of the biologist, is threatened by the artificial earth currents of the electric railway.

That the crisis is serious there can be no doubt, but I will only anticipate the fuller discussion which will take place by stating that magneticians, in common with the rest of the world, recognise the great benefit which electric traction confers upon the community at large. We are not so foolish as to desire to embark on a crusade against a great industrial improvement of which science may well be proud; on the other hand, we must hold fast to the position that provision for the conveniences which are immediately appreciated by the public should be made with as little damage as possible to those studies which are not less for the ultimate benefit of the race.

Had science, when the use of coal was introduced, been sufficiently advanced to devise means for smokeless combustion, an evil which now in more senses than one darkens the lives of the inhabitants of our great towns might have been prevented from attaining its present gigantic proportions.

We are now at the beginning of another industrial epoch, which may, indeed, if power is transmitted from a distance on a large scale, brighten our skies, but which threatens to saturate the earth beneath us with electric currents. That these may interfere with the general comfort is evident from the injury which has been done to underground pipes at Washington and elsewhere. The construction of a powerful electrical railway in the immediate neighbourhood of the laboratories of a college would interfere with its efficiency, and make it impossible to perform experiments of certain types. In such a case, however, something could be done by arranging the experiments to suit the conditions under which they would have to be performed. But in the case of a magnetic observatory no such protective measures are possible. The very object of the observatory is to measure the earth's field, and if that field is artificially altered no modification of the methods of measurement, however ingenious, can overcome this fundamental defect. I am glad

to take this opportunity of acknowledging that both the danger to pure science and the necessity for obviating it have been acknowledged by those who are chiefly interested in the technical applications of science.

JEFFERSON AS ARCHITECT.

PERHAPS no epitaph is better known to the readers of American history than the one Thomas Jefferson wrote for himself—now on his tombstone at Monticello—containing these words:—"Author of the Declaration of Independence, of the statute of Virginia for religious freedom and Father of the University of Virginia."

Many times have they been repeated as a good summing-up of his three greatest achievements. But I doubt, says a correspondent of the *Boston Transcript*, whether the full meaning of the last achievement can be realised until the vision of the Classic buildings at Charlottesville dawns upon one, and the origin, aim and workings of the University are fully known.

As the rotunda comes in sight for the first time, one immediately feels an atmosphere of Classic beauty which no other building in the country so quickly suggests. The travelled mind is at once transported to its model, the Pantheon at Rome, though it is only one-third of its size; a walk down the cloistered-like façades of the pavilions (the professors' homes), also suggests Italy as nothing else in the land does; and I do not forget the beautiful cloister-like aspect of the Leland Stanford University in California. Perhaps there is nothing more original or unique of its kind than the ingenious serpentine brick walls on the grounds. There is certainly a Classic flavour about the pavilions, copied as they are from the Roman buildings of Palladio in his work on architecture. This was practically illustrated by a casual reference to a professor having his home in the "Theatre of Marcellus," &c. The Doric, Ionic and Corinthian porticoes in this little Classic village are an education in themselves. For the carving of some of the capitals of the columns skilled workmen were imported from Italy, although the chief work was done by Americans.

Upon seeing the buildings I did not wonder that George Ticknor, on visiting them with Jefferson in 1824—the year before the University was opened to students—wrote to Prescott, the historian, that "they had a mass of buildings more beautiful than anything architectural in New England, and more appropriate to a university than could be found in the world." And he had then been in Europe. The buildings deeply impressed Lafayette, who also visited them about this time.

All this goes to prove that Jefferson succeeded in his determination, as architect of his pet University, to impress the new America with architectural effects of Classic beauty. It is said that had he consulted his daughter Martha even more than he did, the interior arrangements of the pavilions might have been blessed with more conveniences, such as closets, &c. But he was more inclined to attend to outward effects. The sturdy old locks and keys which do service in rooms to-day attest to his idea of thoroughness.

It is a cause for deep joy that these ten original pavilions, linked by student rooms, all set in a grass court, as well as the ingenious brick walls, were not devastated by the fire which visited the region in October 1895. These, as well as the rotunda, found ardent admirers in the architects, McKim, Mead & White, when they were called to replace some of the buildings burned. That they built them in harmony with the Classic style of the old testifies to their wisdom and taste.

It is safe to say that no university in the world is more imbued with the personal life of one man than this one in Charlottesville, Va., with the life of Thomas Jefferson. He not only wrote the deed for the land, but he stuck the first peg in its laying out, and with a 12-inch rule (3 inches when folded), assisted by an employé who tells it, he laid out the foundations for the buildings. Besides making all the drawings for them he superintended every detail for their construction and engaged the workmen. He trained carpenters, masons, bricklayers and even designed implements for them. He designed the classic-looking bell which, when no longer available for use, was, fortunately, preserved for the museum—a most interesting relic.

The old statesman worked as if building his own private house. Nothing poor was allowed to be used. Though nearing eighty years of age, he was on the ground every day when weather permitted, superintending affairs. Seated on a seat of his own invention, a walking stick of three sticks spread out and covered over with a piece of cloth, he found it his delight to watch the men as they worked. With this he was not satisfied. From his elevated home at Monticello, three miles away, he would watch the work with his glass. It is said that if anything was wrong he would immediately go down to make it right.

A proud day for him, as well as a gala one for the crowds that assembled, was the laying of the corner-stone, when President Monroe preceded some remarks by "holding the instruments and pronouncing it square." Jefferson began then to see the fruition of his many years' work in its behalf. Friends had helped him, notably Joseph Cabell in legislative acts, and others by money subscriptions. Monroe, Madison, Cabell, Cocke and several others had given, with him, 1,000 dols apiece.

A still prouder day was when the University was opened in 1825 with forty students. Jefferson, as rector, though past fourscore, became the inspiring leader. Several times a week he invited to Monticello the professors, all of whom were from over the sea except two, those of law and politics and ethics. These Jefferson insisted upon should be Americans. Once a week a party of students were his guests. He thus kept in touch with the University and opened a way for the carrying out of his original ideas concerning it. Daniel Webster felt the value of these ideas in his visit to Jefferson at Monticello, when he wrote that the University, which was "coming into existence almost entirely from his exertions," was a chief topic of conversation.

Posterity has not done justice to the subtle influence of this "academic village" upon the country's educational progress. No one conversant with George Ticknor's relations with Harvard College can fail to see the benefit to Harvard from Jefferson's ideas concerning his own university. (The monograph of Professor Herbert B. Adams ably points this out.)

Not only Ticknor, a professor at Harvard for fifteen years, was influenced in the lifetime of Jefferson, but Josiah Quincy, the year after he became president of the college, when Madison was rector, began to look into Jefferson's work. He even started to go to the university, but a report of fever prevented his reaching it. Years later the president of Brown University, Francis Wayland, visited the University of Virginia and gained helpful suggestions. Our own Commissioner of Education, Dr. W. T. Harris, has put on record that "Jefferson's University is more and more copied or appreciated in the regulations and practical details of colleges and universities North and South."

Jefferson died feeling that his work was not appreciated, but he was confident that justice would finally come. Benefactors have arisen, such as Miller, Corcoran, McCormack, W. H. Vanderbilt and others more recent, and there is room for more. The McCormack Observatory stands on the mountain a mile away which Jefferson selected as a spot for it. The Virginia Legislature has been good to it, at one time clearing the annual appropriation from the large debt surrounding it. Though the State suffered greatly by the war, it nobly continued its annual gift. It doubtless could not forget that aside from its being Jefferson's "darling child of his old age," hundreds of its students gave their lives in behalf of the State. General Sheridan doubtless remembered its origin and history when, during his few war days there (the only time the war came near it), he ordered guards to be placed around the grounds in order to preserve the property.

Besides the graduates and students who have honoured it, including such men as Kane, the explorer, Edgar Allan Poe, Thomas Nelson Page, three Presidents of the United States have been intimately connected with it as the first three rectors. Monroe House still commemorates the memory of Monroe, and Madison's gift by will is remembered.

The civil war necessarily left its pecuniary effects upon this time-honoured university. But it has taken upon itself new life with its new buildings. It is still determined to have only the best professors, and to use every good means in its power to fulfil all that Jefferson desired for it. As such it has a national interest, and should receive the loyal homage of every lover of Jefferson.

AUSTRALIAN COPYRIGHT.

UNDER the International Copyright Act, 1886 (49 & 50 Vic. clause 33), and the orders in council thereunder, the greater part of the body of imperial copyright law applicable to literary and artistic works, together with the Copyright Convention of Berne, became reciprocally applicable to Great Britain and the countries that are parties to the convention, namely, Great Britain with her colonies and possessions, France and her colonies (including Algiers), Germany, Italy, Spain with her colonies, Switzerland, Luxembourg, Monaco, Hayti, Belgium, Montenegro and Tunis; consequently, it is now possible for colonial copyright works to receive international protection within the limitations prescribed by law. The same Act places colonial copyright in literary works upon the same footing as imperial copyright; that is to say, a work first published in a colony may by registration in such colony obtain protection throughout the British dominions. The registrations effected under the Act up to the end of 1897 amounted in number to 2,425, receipts to 763*l.*, and disbursements (salaries) to 5,900*l.* Books are protected for the natural life of the author and for seven years after his death, or for

forty-two years from first publication, whichever may be the longer period; paintings, drawings, sculpture and engravings for fourteen years; photographs, three years; articles composed wholly or chiefly of metal, wood, stone, cement, glass, earthenware, ivory, bone and similar substances, three years; paperhangings, carpets, oilcloths and all kinds of textile and woven articles, two years. To obtain the benefits of the Act in reference to designs, every article must bear the word "Registered," together with the name of the proprietor and the date of registration.

THE ASSAM EARTHQUAKE, 1897.

A PAPER was read at the meeting of the British Association on the 9th inst. by Mr. R. D. Oldham on the great Assam earthquake of June 12, 1897. He said that this earthquake was the largest and, with a few possible exceptions, the most violent of which there was any record. The area over which the shock was sensible was not less than 1,750,000 square miles, while the focus occupied an area of 200 miles in length and 50 miles in width. If it had happened in England not a house would have been left standing between Manchester and London. Landslips on an unprecedented scale were produced in the Garo and Khasia hills and in the Himalayas north of Lower Assam. A number of lakes had been produced by changes of level due to the earth-movements by which the earthquake was caused, and the mountain peaks had been moved both vertically and horizontally. Monuments of solid stone and forest trees had been broken across by the violence of the shaking they had received. Communications of all kinds were interrupted; bridges were overthrown, displaced, and in some cases thrust bodily upwards to a height of as much as 20 feet, while the rails on the railways were twisted and bent. Earth fissures were formed over an area larger than [the United Kingdom, and sand rents, from which sand and water were forced in solid streams to a height of 3 feet to 5 feet above the ground, were opened in incalculable numbers. The loss of life was comparatively small, owing to the time of day at which the earthquake occurred—five o'clock in the afternoon—and the damage done was reduced by the fact that there were no large cities within the area of maximum violence; but in extent and capacity of destruction, as distinguished from destruction actually accomplished, this earthquake surpassed any of which there was historical record, not even excepting the great earthquake of Lisbon in 1755. At the conclusion of the paper he mentioned that the Government of Assam, the whole of whose offices were destroyed, were able to announce within five days that everything was in full swing again; and as to the railways, on which for a length reaching as far as from Bristol to London and on to Dover traffic was at first entirely suspended, in three weeks' time trains were running to their original timing.

TESSERÆ.

The Early Renaissance in Italy.

IT has been usual to date the revival of art in Italy at about the tenth or eleventh century. The beginning of modern art may, however, be reckoned from an earlier time, rather, as Flaxman says, from the reign of Constantine, seven centuries earlier, when Christianity became the religion of the Empire. Painting and sculpture then ceased to be employed as heretofore on the pagan gods, but were engaged to illustrate subjects connected with Christian worship. Even during the reigns of those emperors by whom the Christians were most persecuted they ornamented their subterraneous retreats with sacred portraits and subjects from Scripture. The artists to whom the chief merit of reviving art is due are supposed to have derived no small benefit from the study of the remains of ancient sculpture which were still scattered about Italy, and particularly in Pisa, the native city of the presumed founder of the first school of modern sculpture. Without denying this very probable effect of superior works upon minds just awakening to the beauties of art, it may be disputed whether its influence was so great as some have imagined. It scarcely can be traced where it might most reasonably be supposed to exist, namely, in any peculiarities or finer qualities of style or execution, and it surely must be conceded that the mind and spirit that are observable in the paintings and sculptures of the time of the revival are of an entirely original character and quite independent of the ancient schools. This is remarkable in a class of design which at first seems peculiarly calculated to tempt modern artists to recur to the manner of the ancients, namely, that in which symbols and allegorical figures are employed. In the examples that exist by one of the earliest painters, Giotto di Bondone (chiefly in the Capella "dell' Annunziata" and in the "Salone" at Padua), there certainly is no apparent imitation of any of the numerous and varied modes of treating such subjects that were offered to him in the monuments of antiquity. Without the most remote idea of underrating the excellence of fine ancient models, it seems only just to assert a claim for the distinct and original character which divides modern Christian art from that of the Greek schools. A depth of thought, an intention pervades the Christian art, which shows an entirely altered feeling, and after the first period of the rude and almost frightful attempts at design (usually in single figures, gaunt and staring images of the apostles and saints), the revivers of art seem to have aimed at appealing to the sympathies, rather than gratifying the eye and pleasing the fancy only by presenting to them beautiful forms. On this ground the artists of this age were essentially men of genius, for, instead of servilely copying, they drew from their own original sources, and the art that proceeded from them eventually became, as was the case with Greek art while master-spirits directed it, great and admirable.

Ancient Saws.

Saws were used by the ancient Egyptians. One that was discovered, with several other carpenters' tools in a private tomb at Thebes, is now preserved in the British Museum. The blade, which appears to be of brass, is 10½ inches long and 1¼ inch broad at the widest part. The teeth are irregular, and appear to have been formed by striking a blunt-edged instrument against the edge of the plate, the bur, or rough shoulder, thus produced not being removed. A painting copied in Rosellini's work on Egyptian antiquities represents a man using a similar saw, the piece of wood which he is cutting being held between two upright posts. In other representations the timber is bound with ropes to a single post, and in one, also copied by Rosellini, the workman is engaged in tightening the rope, having left the saw sticking in the cut. In an engraving given in the third volume of Wilkinson's "Manners and Customs of the Ancient Egyptians" a saw is represented of much larger dimensions, its length being, by comparison with the man, not less than 3 or 4 feet. It does not appear that the Egyptians used saws worked by two men. The invention of saws was variously attributed by the Greeks to two or three individuals, who are supposed to have taken the idea from the jaw-bone of a snake or the back-bone of a fish. There is a very curious picture among the remains discovered in the ruins of Herculaneum, representing the interior of a carpenter's workshop, with two genii cutting a piece of wood with a frame-saw, and on an altar preserved in the Capitoline Museum at Rome there is a perfect represention of a bow-saw, exactly resembling, in the form of the frame and the twisted cord for tightening it, those used by modern carpenters. From these remains it is evident that these forms of the instruments were known to the ancients.

The Bridge of St. Angelo, Rome.

The original construction of this superb bridge is ascribed to the Emperor Ælius Adrianus, who erected it about the year 136 of our era, to give access to his mausoleum and the contiguous imperial gardens. Hence it received the name Ælian, as also that of Pons Hadriani or Trajani (all names of the same emperor). In the Middle Ages it was also called Pons S. Petri, and afterwards the denomination Castellum S. Angeli, given to the mole of Adrian, gave rise to the name of Ponte S. Angelo, about the end of the fifteenth century. An authentic record of this bridge exists in a medallion of bronze, presenting on the face the head of Adrian with his names and titles; on the reverse, the bridge with five arches, adorned by eight columns and as many statues surmounting them. On the front of the mausoleum towards the bridge was formerly a lapidary inscription, establishing the epoch of the construction of the latter about 136 of our era. To these documents are added the testimonies of many historians, amongst others that of Spartianus, who lived in the time of Diocletian and wrote the biographies of several emperors. When Boniface VIII. (Caetani) instituted for the first time the Jubilee, in 1300, he ordered that the bridge should be divided by a partition carried across its length to provide against the dangers occasioned by the pressure of the throng on their way to St. Peter's. To this it appears that Dante has alluded in the "Divina Commedia" (Canto XVIII. Part I.) where, after describing the site and form of the circle of Malebolge, he says that in the abyss of this field of punishment were naked sinners, who came from one side of its circle towards him and from the other, following in the same track he himself pursued with his sapient guide. "Even thus the Romans when the year returns of Jubilee, with better speed to rid the thronging multitudes, their means devise for such as pass the bridge, that on one side all front towards the castle, and approach St. Peter's fane on the other towards the mount." We read in the "Rerum Italic. Scriptores" that in 1450, when the people were returning from receiving the benediction at St. Peter's from Nicholas V., the superincumbent weight caused the bridge to give way and 172 persons perished; in memorial of this the Pope erected two circular chapels at its ingress and had the whole restored, as is recorded on one of

the columns on the side towards the Vatican, bearing the initials N.P.P.V. To guard against such accidents the same Pontiff ordered several houses to be levelled, thus forming the Piazza called di Ponte. The chapels were thrown down by order of Clement VII. (Medici) in 1527, for the enlargement of the thoroughfare, and in their place were erected the statues of St. Peter and St. Paul at the entrance of the bridge, the first raised on its structure. In 1668, Clement IX. (Rospigliosi) desiring to embellish it, consigned the task to Bernini who, instead of the former close parapets, carried a balustrade across its span and erected the ten colossal statues of angels bearing the instruments of the Passion, but of which one only is the work of his chisel; the others by his pupils from his own designs. In honour of this improvement (the last the bridge has received), two medals were struck with the inscription "Ælio ponte exornato," in the reign of the same Pope. The statues of the angels, which follow in order those of the apostles, display all the peculiarities of the school of Bernini. Regarded artistically they cannot be applauded, but still the conception of the decoration, as a whole, is imposing and beautiful, and in this Bernini lavished all the riches of his invention, uniting and harmonising the details of the ornaments with great skill, placing the statues in succession as the primitive structure of the bridge required, and deducing the subjects from the name of the bridge and castle.

Architectural Abuses.

Architecture, says Palladio, being an imitatrix of nature, delights in that which is most consonant with her prototype. The ancient edifices being of wood, and trees themselves forming the columns, when architects began to build with stone they made the columns to imitate the trunks of trees, tapering from their bases. Being thus originally of wood, and therefore liable to split when much loaded, they bound them with rings at top and bottom to prevent their splitting. Thus the bases and capitals in the different orders seem originally derived from these bandages, though they are now become essential ornaments. Thus also in entablatures the triglyphs, modillions and dentils represent the ends of those beams and timbers which are employed for the support of the floors and roofs. If, therefore, all these conditions be duly considered, those practices in building are highly to be reprobated which are in opposition to that analogy which should exist between the original and its imitation, or which depart from nature and the simplicity observable in all her works. Consoles or cartouches, which are of a scroll-like form, should never be employed for the apparent support of great weights in place of columns or pilasters, nor should they ever project from or spring out of cornices. Pediments and frontispieces over doors and windows or elsewhere should on no account be broken or disconnected in the middle, for the intention of these is to shelter the parts below from the rain, and this result is completely obviated by such a practice. The projecture of cornices, though for the purpose of sheltering buildings, should not be more than in due proportion to their height, whether or not accompanied by columns; for if too heavy they seem to threaten with danger those who retreat thereunder for shelter, and if too small in projection they do not properly perform their office. Again, those columns which are feigned to be composed of several pieces, by being jointed together with rings, should be carefully avoided, because the more solid and strong the columns appear the better they seem to execute the purpose for which they were erected, which is securely to receive the superincumbent loading. There are many other abuses which the authority of great masters may sanction, but not justify.

The Arts and Religion.

The arts have at all times served religion in the first place, in the second the pleasures of the great or of the people, and, according to the nature of either, assumed various configurations and met with various destinies. Hence in the Egyptians they present the image of a people degraded by grotesque or cruel rites, and basely sunk under the yoke of its tyrants, amongst whom their office became, not to admonish or delight, but to terrify and prostrate. Whilst Paganism elsewhere animated all nature with beautiful and smiling imagery the people of the East, and the Egyptians most of all, took delight in horrific and hideous divinities, and veiled their religious doctrines with mysterious and obscure myths and symbols. Amongst them art was strictly orphic and symbolic, the pasture of deluded minds and corrupt hearts. Under the smiling heaven of Greece, among a people truly great and endowed with an exquisite sense of the beautiful, art inspired the voluptuous and poetic theogony of Hesiod and Homer, delighting in the most graceful forms and approximating so near to the sublime, that other nations despaired of being ever able to arrive at such a refinement. But rarely did it assume the office of correcting and exalting morals, instead thereof seeking only to delight, and often addicting itself to voluptuous turpitudes. With the Romans it expressed the all-ascending genius of conquest, and was devoted to the recording of wars and triumphs; rather than to the simple and graceful it aspired to splendour and magnificence, and thus sowed the seeds of that tremendous ruin which ten centuries did not suffice to limit. Finally, Christianity came to sublime art to yet unimagined greatness, confiding to her the holy office of admonishing the people of truth, of awakening the love of virtue, associating it with all her joys and all her sorrows, and opening to its ken beyond the visible world a field of infinite extent to the Gentiles unknown. In this manner, as with the Egyptians, art was inspired by terror, with the Greeks by pleasure, with the Romans by glory; Christianity has impressed upon it the character of the instructress, the comforter of man.

Andrea Mantegna.

Intensity may be said to be the characteristic of Mantegna as an artist; he swerved from his purpose neither to the right nor to the left. In expressing tragic emotion he sometimes touched a realism beyond the limits prescribed by poetic art. So, too, he never arrived at an ideal of female beauty. But he could be as tender as he was stern; and we forget the homely plainness of one of his Madonnas in the devoted and boding mother, or the benign protectress. His children are always childlike and without self-consciousness. He loved allegory and symbolism, but with him they clothed a living spirit. Regarding Mantegna from the more purely technical side, he was a master of the highest order. His forms are correct and nobly conceived; the extremities carefully wrought out and select. An occasional lengthiness in his figures adds to their dignity, and never oversteps possible nature. His colouring, whether it was the product of a defined system or of certain predilections only, has a harmony of its own that more than satisfies the eye. Drapery he treated as a means of displaying the figure. This he derived from an almost too exclusive study of ancient sculpture. Yet so thoroughly does it accord with his whole style that none would willingly miss a single fold which the master thought worthy of such infinite care.

Tudor Sumptuary Laws.

Queen Elizabeth thought enormity of dress a royal prerogative; for on February 12, 1579, an order was made in the Star Chamber "that no person should use or wear excessive long cloaks (this might proceed from apprehension of their concealing arms under them), as of late be used, and before two years past hath not been used in this realm; no persons to wear such great ruffes about their necks; to be left off such monstrous undecent attyring." Also another against wearing any sword rapier that shall pass the length of one yard and a half a quarter in the blade, nor dagger above twelve inches in the blade at most. In her father's time, who dictated in everything, from religion to fashions, an Act of Parliament was passed in his twenty-fourth year against inordinate use of apparel, directing that no one should "wear on his apparel any cloth of gold, silver or tinsel, satyn, silk, or cloth mixed with gold or silver, any sables, velvet, furrs, embroidery, velvet in gowns or outermost garments, except persons of distinction, dukes, marquisses, earls, barons and knights of the order, barons' sons, knights of such that may dispend 250*l.* per ann." This Act was renewed in the second of Elizabeth. Edward VI. carried this restraint still further. In heads of a Bill drawn up with his own hand, 1551 (though it never passed into a law), no one who had less than 100*l.* a year for life, or gentlemen, the king's sworn servants, was to "wear satten, damask, ostrich feathers, or furrs of conies; none not worth 200*l.* or 20*l.* in living certain, to wear chamblet; no serving-man under the degree of a gentleman to wear any furr save lamb, nor cloth above ten shillings the yard."

GENERAL.

The Meeting of the British Association will be held next year in Dover, under the presidency of Dr. Michael Foster. In 1900 the meeting will be in Bradford.

The Competition for the Glasgow Exhibition Building of 1901 has been decided. Mr. James Miller obtained first prize.

Mr. W. E. Knollys, C.B., chief general officer, has been appointed by the Local Government Board to hold, after the vacation, an inquiry into the causes of the excess of cost over the tenders received for the erection, &c., of the Brook Hospital, the architect's responsibility, and the supervision exercised by the committee and the managers of the Metropolitan Asylums Board as regarded expenditure.

Sir Charles Legard has presented four large pictures for the dining-hall of the Scarborough Workhouse.

M. Osiris, of Paris, offers a prize of 100,000 francs (4,000*l.*) to the author or authors of the work which shall be judged by the Parisian Press Association to be the most meritorious from an artistic, commercial, or humanitarian point of view.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

LIVERPOOL.—Oct. 3 (time extended).—Designs for new buildings for Royal Institution (50 guineas, 20 guineas). Mr. Harold Waterhouse, hon. sec., 3 Cook Street, Liverpool.

REIGATE.—Oct. 6.—Designs for Municipal Buildings (limit 15,000*l.*, premiums 50*l.*, 30*l.* and 20*l.*). Particulars from C. J. Green, town clerk, Station Road, Redhill.

WIVENHOE.—Sept. 29.—For water supply and drainage schemes. Particulars from C. W. Denton, 8 East Stockwell Street, Colchester.

CONTRACTS OPEN.

ABBOTSKERSWELL.—Sept. 24.—For erection of two loose boxes and a carriage-house, &c., at Court Grange. Mr. W. F. Tollit, architect, Gate House, Totnes.

ABERTILLERY.—Sept. 20.—For rebuilding business premises and houses. Messrs. Swash & Bain, architects, Midland Bank Chambers, Newport.

ASHTON-UNDER-LYNE.—For pulling-down old property and erecting six dwelling-houses. Mr. T. D. Lindley, architect.

ASKHAM-IN-FURNESS.—Sept. 19.—For completion of Sunday school and reseating of the Primitive Methodist chapel. Rev. John Smith, Slater Terrace, Dalton-in-Furness.

FOLKESTONE is about to add to its numerous attractions by the erection of a theatre and palace of varieties, a site for which, with an extensive frontage to Church Street, and of ample depth, has been secured, and building operations have already been commenced.

THE chancel of All Saints, City, Bristol, has been closed for some time in connection with the number of improvements which have been carried out by Messrs. W. Cowlin & Son in the interior of the church. They have just completed a new oak roof with carved bosses, and altogether of an ornamental character in the chancel. On the south side they have just finished a new sedilia, showing a very handsome arcading in harmony with the stained carving at the back of the altar. They have also enlarged the existing organ chamber by cutting through the north of the chancel, a thickness of over 3 feet, and constructing a very handsome arch with Bath stone, thus giving greater accommodation for the organist and increasing the facilities for the softest notes of the organ to be heard throughout the church.

ELECTRIC NOTES.

THE Hampstead Guardians have accepted a tender for 1,025*l.* for fitting up their workhouse with the electric light.

AN important meeting of the electric-lighting committee was held recently at Llandudno, at which Mr. Preece, electrician, reported that the light would be definitely available at the generating station from this date. The erection of a chimney at the generating station had now been completed, and consequently the chief cause of delay removed.

THE switching apparatus of the great electricity works of the city of Geneva, situated on the Rhone, near Chevres, caught fire last week, and in a short time the entire works were destroyed. In consequence the transmission of the electric current for motive power and the illumination have ceased throughout the canton of Geneva.

AT the Dover Town Council meeting on the 13th inst. it was officially reported that the first year's working of the Corporation's electric tramways, after allowing for payment of interest and instalments of the loans, had resulted in a profit of 1,300*l.* being earned. This is equivalent to a 2*d.* rate. A total of 1,794,903 persons have been carried at the universal fare of 1*d.*

THE Corporation workmen have been engaged repairing damage which had been done to the electric-light wires under the pavement in Princes Street, at the corner of South Charlotte Street, Edinburgh, through the fusing of one of the main wires. Something of the nature of an explosion occurred. The fire brigade was called out, and after examining the cellars of several of the shops they came on some woodwork which was burning as a result of the explosion.

AT the St. Pancras Vestry meeting on the 12th inst. a letter was read from Mr. F. J. S. Hopwood, on behalf of the Board of Trade, with reference to Major Cardew's investigation of the circumstances attending an explosion of gas that occurred in

an electric-light culvert in Cumberland Terrace, Regent's Park, resulting in damage to the Vestry's culverts and mains for a length of 400 yards. Mr. Hopwood wrote :—"Having regard to the grave risks to the public safety and the disorganisation of the supply of electric energy involved by accidents of this nature, I am to urge upon the Vestry the necessity of taking all possible precautions to prevent accumulation of gas in their culverts, and as it would appear to be impossible in all cases to provide adequate ventilation I am to suggest the desirability of frequent inspection of street boxes." Dr. Walter Smith, chairman of the Vestry's electricity committee, said the Gas Light and Coke Company were clearly responsible for the explosion, and a resolution was adopted authorising a claim against them to make good the damage.

BUILDING AND BUILDERS.

THE foundation-stone of a new church at Savile Town, near Dewsbury, was laid on the 10th inst.

AT the last meeting of the plans and works committee of the Edinburgh Town Council tenders were opened for the Portobello Public Baths, the cost of which will be at least 30,000*l.*

JAMES CURRELL, a Great Northern Railway employé, while engaged repairing the well-known lofty railway viaduct at Welwyn, fell below, a distance of over 100 feet, with the result that he met with a terrible death, his body being almost smashed to a pulp.

THE destruction was commenced on Monday last of an historical block, opposite Lambeth Palace, known for many years as Bunyan's Place, and in old times as the Archbishop of Canterbury's Court, for the purpose of improving the southern approach to Lambeth Bridge, which by virtue of a resolution of the County Council will not long hence share a similar fate to that at Vauxhall.

AT a recent meeting of the Arbroath Town Council there was read a correspondence with the postal authorities regarding the new post office to be erected in Hill Street. The Council desired the front of the office to be brought out to the High Street. The Post Office replied that this would add 2,000*l.* to the cost. The Council were willing to reduce that to 1,500*l.*, but the Post Office held that a building according to the Council's plan would not be as convenient as their own, which, accordingly, they are to proceed with.

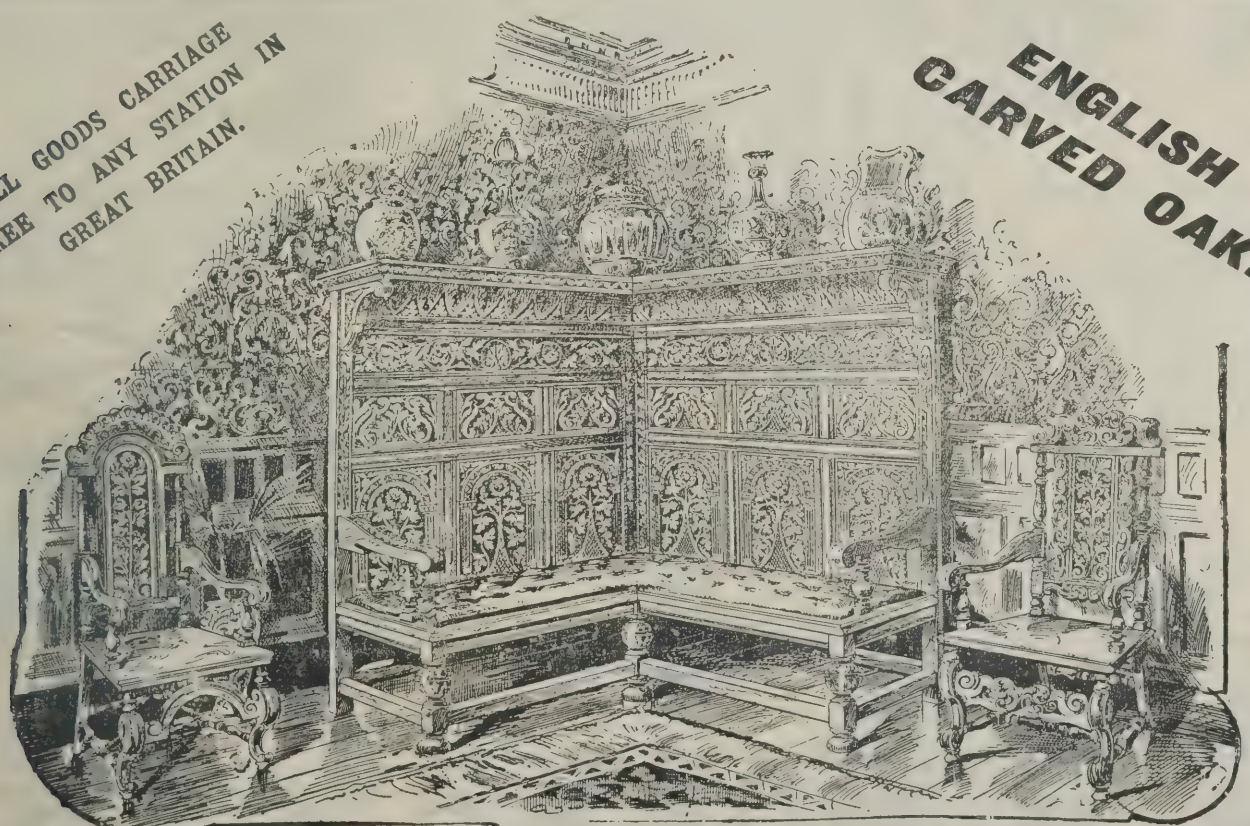
TRADE NOTES.

FOR the new palm house and conservatories in the Public Park at Blackburn the designs of Lockerbie & Wilkinson, Limited, Birmingham, have been selected, and their tender (1,495*l.*) for the erection has been accepted.

THE Ediswan "Queen of Lamps," brought out by Messrs. Edison & Swan, of Queen Street, E.C., is certainly one of the best incandescent lamps on the market. Its chief feature is the perfect diffusion of light which it provides. The top reflecting part of the bulb is made of opal glass, by which a very soft even light is obtained, altogether free of the "lines" or shadows peculiar to silvered bulbs. It is recommended for ceiling panels, pictures, &c., and where perfect illuminating effects are required.

MESSRS. NICHOLLS & CLARKE, of 6 High Street, Shoreditch, have just executed a three-light memorial window, which is to be placed in a church at Totnes. The work is altogether one of considerable excellence, whether regard be had to the design or its treatment. The design, which represents the Resurrection, is well conceived and the composition effective. In the centre panel or light is the risen Christ, while in rear on the right is a winged angel in the act of removing the stone from the mouth of the sepulchre. In the upper part of the left panel are three draped female figures on their way to the tomb, the chief, the Virgin Mary, being particularly good alike in pose and expression. At foot of the picture are three Roman soldiers, two of them asleep, and the third wearing a most natural expression of amazement at the empty sepulchre. At the head and foot of each light is a well-designed canopy and base, while over all is some artistic tracery, the apex being the usual monogram. The whole window when in position should have a very fine effect, and the more so as, apart from the artistic treatment of the subject, the work is admirably executed, the colours being very clear and harmoniously blended.

VARIETIES.



THE church of St. John, Fairfield, Liverpool, was reopened after renovation on Sunday.

THE Lock Chapel in the Harrow Road has been redecorated and greatly improved in honour of its Jubilee.

VICTORIA Wesleyan Methodist church, Cheetham, Manchester, has been reopened after complete renovation.

AN excursion meeting of the Northern Architectural Association will be held to-morrow (Saturday).

AN excursion of the Dundee Institute of Architecture, Science and Art to Loch Leven, Kinross House, Portmoak Church, &c., will be held to-morrow (Saturday).

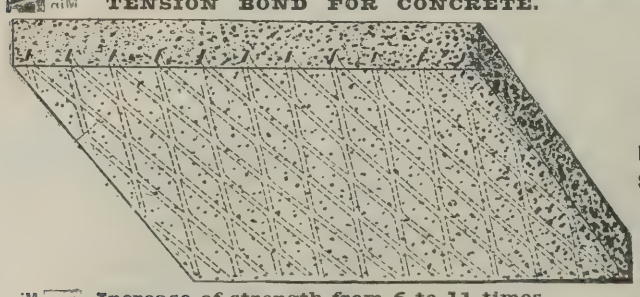
THE roof of the smoke tower of the Natural History Museum, South Kensington, was damaged by fire on Friday last.

A NEW parish hall, which has been built in connection with Nantwich parish church, was opened on Monday last. The new building, which is intended to be used for parochial purposes, has been built by public subscription at a cost of over 3,000*l.* upon a site given by the late rector, the Rev. F. G. Blackburne, now rector of Bury.

A BODY of about fifty workmen are busily engaged in repainting and renovating the ironwork in St. Paul's Cathedral and painting the railings, &c., in the churchyard. The dean and chapter have decided this year to put a new face to the clock, and last week half a dozen skilled workmen began the task. The new dial will be ready for fixing in a few days.

A SYNAGOGUE in Spitalfields was opened on Sunday, the 11th inst. The newly-dedicated building, which has seating accommodation for 1,800 men and women, was the first place of worship erected by the Huguenots in 1743, and afterwards passed over to the Wesleyans, who held their first public service there. It was recently acquired by the East End Jews, and reconstructed at a cost of 6,000*l.*

BUILDING LAND AT BEMBRIDGE, ISLE OF WIGHT.



MESSRS. DOUGLAS YOUNG & CO., 51 Coleman Street, E.C., will on Tuesday next offer some fifty lots of very attractive building sites on the Bembridge Lodge and Brading Harbour estates in the Isle of Wight. Bembridge, with its picturesque surroundings, is rapidly growing in popularity, and, apart from its natural beauties, has many attractions for holiday-makers. There are extensive "links" for lovers of golf, and numberless pleasure-boats, canoes, &c., for use on the still waters of the haven or the rougher bosom of the outside sea, besides all the necessary means and facilities for sea-fishing and so forth. There is also a thriving sailing club, now numbering over 200 members, whose regattas take place at stated intervals all through the summer. But the popularity of Bembridge is undoubtedly due to the charm of the surrounding neighbourhood. The walk along the coast and round the Foreland to Whitecliff Bay opens up a succession of extensive sea views. For pedestrians no more enjoyable expedition can be suggested than a climb up Bembridge Down (355 feet high), from the summit of which extensive views are obtained of the mainland as far as the Sussex coast, and the district is not without features of historical interest. A little way inland stands the old manor house of Woolverton, built by Sir Ralph de Woolverton, in 1370, and now used as a farmhouse. Tradition asserts that there was at one time a large town hereabouts, known as Wulfre's Town, which was destroyed either by the French or Danes during one of their visitations. Here, too, is Centurion's Copse, which is said to mark the site of St. Urian's Chapel, a small oratory which went the way of other like institutions in the reign of Henry VIII., and of which no remains now exist.

Extending about a mile north of Bembridge is Brading Harbour, lying just south of the pretty little village of St. Helen's. The harbour is formed in the estuary of the eastern Yar and is famous for its oyster beds along the banks of the river. The harbour was first formed by Sir Hugh Myddelton, or rather this famous engineer of Jacobean times enlarged and restored a small harbour that had formerly existed.

Brading is pleasantly situated at the foot of an extensive town on the high road between Ryde and Ventnor. It contains many features of interest; a pair of stocks and an old lock-up, interesting memorials of a bygone age, still exist in the market place, whilst a stout ring firmly fixed in the ground marks the site of the old bull-ring. At Morton Farm, near Brading, the interesting ruins of a Roman villa were discovered in 1880. More recent excavations have revealed the presence of another "wing" or group of buildings, comprising a series of chambers, corresponding to those unearthed.

Messrs. Douglas Young & Co. also announce an important sale of sixty-nine plots of building land at Bexhill-on-Sea on the 5th proximo, and on the 26th proximo they will offer an estate of 11,000 acres in Wiltshire, and the Ashdon, Bartlow and Radwinter estates in Essex. It may be noted that both the Wiltshire and the Essex properties form portions of the assets of Mr. E. T. Hooley.

"BESTO" GLASS.

"BESTO" glass is the name given to a new product which, after having "caught on" in the United States and Canada, is now being offered in the English market, where it is likely to meet with similar success.

It is being introduced by the "Besto" Glass Company, Limited, 41 Eastcheap, E.C., and is intended for use in skylights, roofs, partitions, floors, fanlights, doors, windows, awnings, &c., in fact, in any position where the heavy glass known as "rough rolled plate," or other glass in plates, sheets, blocks or prisms is commonly used, but is in many ways far superior to any of the kinds of glass for which it is intended to be substituted. The new material consists of glass, either white, coloured, transparent, translucent or opaque, having wire embedded and wholly enclosed in the body of the glass. The wire, which is covered with asbestos previously to its enclosure in the glass, is in the form of a netting, having a mesh of about three-quarters of an inch which is embedded about at the centre of the sheet of glass, which is made in thickness from about one-quarter of an inch up to 1 inch or thicker, according to the purpose for which the glass is to be used. It can be made of any desired pattern; one of those which have found greatest favour in the United States consists of a smooth surface on one side and on the other longitudinal prismatic ribs of about half an inch in width, which increases the light admitted, and directs it into the position where it is most required.

Among the advantages claimed for this new material, the following are conspicuous. It is a protector against fire, as, although the heat may crack and break the glass, the wire effectually prevents the pieces from falling apart; against accidental injury to persons or material by the falling of the glass, as if used in skylights, glass awnings, roofs—such as the roofs of depôts, assembly halls, stores, stables, &c.—the accidental breakage of any of the sheets of glass cannot result in any serious injury to persons or goods beneath, as no piece larger than is enclosed in one mesh of the wire can fall; and against burglars, as it would be necessary, in order to make way through a sheet of "Besto" glass, not only to break the glass absolutely into fragments, but to cut away the enclosed wire, and this would be extremely difficult, and would consume considerable time, as each strand would have to be sawed through separately, the adherent pieces of glass being sufficient to prevent the use of wire-cutters.

MUNICIPALITIES AND CONTRACTORS.

A FIRM of contractors has sent to the *Times* the following copy of the conditions that are being imposed on contractors for a certain undertaking for one of the largest corporations in the country. The stipulations, or the tenor of them, are such as no firm of free individuals should agree to :—

General Conditions.—The contractor shall to the (*sic*) at all times during the continuance of this contract abide by, perform, observe, fulfil and keep all and singular the stipulations following, that is to say :—

Wages of Workmen.—The contractor shall pay every workman employed by him, whether in or about the execution of this contract, or otherwise, wages and wages for overtime respectively and at the rate not less than that recognised in the district where the work or any part of it is being done at the standard rate of wages in such workmen's trade.

Hours of Labour.—The contractor shall observe the, and cause to be observed by each workman, hours of labour not greater than the hours of labour (other than that union men only be employed) usually observed in the trade of such workmen in such district.

Lock-out.—The foregoing conditions shall not apply to any trade or trades during the existence of a general lock-out in such trade or trades. The corporation shall be sole judges as to whether such a lock-out exists.

Underletting of Contract.—The contractor shall not transfer, assign or underlet, directly or indirectly, this contract, or any part of it, share or interest therein, without the written consent of the corporation under the hand of the town clerk, which consent may either be withheld or given, subject to the terms such as the corporation may determine, and particularly that the person to whom such contract may, or any part of it, share or interest therein may be transferred, assigned or underlet, shall abide by, perform, observe, fulfil and keep the stipulations on the part of the contractor herein contained.

Book-keeping.—The contractor shall, to the satisfaction o the Council, provide and keep proper books, in which shall be entered from time to time the names of, the wages paid to, and the hours of labour observed by all workmen employed by him, whether in or about the execution of this contract or otherwise, and shall from time to time, when required by notice under the hand of the town clerk, produce the same, or any of them, to him or the deputy town clerk, who shall be at liberty to inspect and take copies or extracts therefrom.

Breach of Contract.—In case of any breach of the contractor or by any person to whom this contract, or any part of it, may be transferred, assigned or underlet, of any one or more of the stipulations in this clause contained, it shall be lawful for the Council to determine this contract in the same manner and to the same extent as they have power so to do under the clause 5 in the events therein specified, and if the contract shall be determined under the present power, then all the provisions of that clause shall apply as if the contract had been determined under that clause.

Tenders to be suitably endorsed and addressed to the chairman of the gas committee, Municipal Buildings.

CASE UNDER BUILDING ACT, 1894.

AT North London Police Court, before Mr. D'Eyncourt, Mr. W. E. Stevens, contractor, of Bridge Street, Homerton, was summoned by Mr. Alexander Payne, district surveyor of East Hackney (South) and North Bow, on September 9, 1898, for building houses at Retreat Place, Homerton, of inferior mortar, not in accordance with the by-laws made by the London County Council.

Mr. Payne stated that he had received notice from Mr. Stevens for the erection of nine dwelling-houses, and four were already nearly constructed. The defendant had removed large quantities of good sand from the ground (presumably for sale), and had used the inferior sand partly mixed with earthy matter in these houses. He had frequently warned him about it, and served him a notice of irregularity on June 15. As there was no material improvement a summons was taken out on August 26. It was shown by the correspondence that Mr. Stevens had complained of the district surveyor being too sharp on him, and had submitted the material to his own surveyor; but it was admitted that his own surveyor could not approve of the material as being in accordance with the by-laws. On this Mr. Stevens requested that the summons might be withdrawn, but this the surveyor declined to do.

The defendant was represented by Mr. Romain, solicitor, but no evidence was called, and the facts as stated were not controverted.

The Magistrate said that only one summons had been taken out, on which he should certainly inflict the maximum penalty under the by-laws of 5*l.* and costs. If a summons had been taken out on each house, he should have inflicted a similar penalty in each case, as it was evident the defendant had been making a considerable profit by using inferior materials and different to what he professed them to be in the mortar.

THE BRICKMASTERS' EMPLOYERS LIABILITY ASSOCIATION.

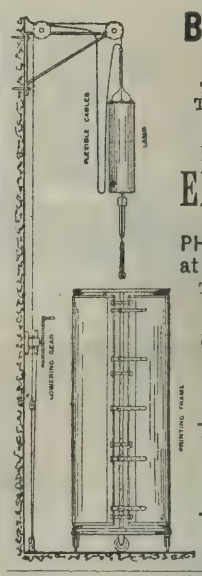
THE first and statutory meeting of the Brickmasters' Employers Liability Association, Limited, was held at the Cannon Street Hotel on August 30, Mr. Wragge (of Messrs. Eastwood & Co., Lim) in the chair.

The notice convening the meeting was read, and the register of members was laid on the table.

The report of the directors was read as follows :—"Your directors have pleasure in reporting that the Association has been duly registered as a company limited by guarantee, and is now fairly established. All the principal stock brickmakers in Kent, Essex and Middlesex have become members, and other classes have been opened for insurance against risks in flint-getting, barge-building, machine and red brickmaking, as well as a class for lime, cement and brick merchants, at rates calculated to cover their risks. The amount of wages upon which insurance has been effected with the Association is now 336,000*l.* and is being increased week by week. A draft of special rules or by-laws for observance by members has been framed, and is now engaging the attention of the board. When approved, copies will be forwarded to members. Members are requested to give immediate notice to the secretary in the event of an accident occurring to any of their workpeople. The services of Dr. Barrett, of Highgate, have been secured as medical adviser to the Association. A call has been made to meet the expenses of establishment and to provide a balance in hand. In accordance with the articles the directors retire. They offer themselves for re-election."

Resolved that the report be received and adopted.

Resolved that Messrs. Robert L. Curtis, Charles Cremer, George H. Dean, Edward William Goodenough, Alfred J. Knight, Henry Packham, Algernon Rutter, John Willson, George Edward Wragge be and are hereby re-elected directors of the Association.



Messrs. D. Wills, J. R. Featherby and Rosher were nominated as the audit committee.

A vote of thanks to the chairman concluded the proceedings.

MEMORIAL SCREEN, HANDSWORTH.

THE new church in Wretham Road, Handsworth, Birmingham, has been closed for alteration. The unsightly end gallery is replaced by an oak vestibule screen. The effect of the alteration has been not only to add to the seating accommodation of the floor to an extent which almost compensates for the removal of the gallery, but to secure for that portion of the church more pleasing proportions than the rigid squareness which formerly marked it. The new vestibule screen is one of the finest in the Midland counties. It is designed in the fourteenth-century Gothic style, and contains seven bays. The central bay is occupied by a pair of doors having in the tympanum over them a carved figure panel illustrating Mary sitting at the feet of Christ, while Martha is "cumbered about much serving." On each side of this doorway are double groups of clustered columns, with enriched brackets above running up into groups of crocketed finials, which finally terminate in winged heralds bearing brazen trumpets. The tracery to the remainder of the seven is richly cusped and moulded with slender columns and carved caps to each mullion, which form the starting-point for the semi-groined canopy, which finishes in a broad carved band. Over the canopy is a traceried balustrade, with crocketed finials to each bay. There are many beautifully artistic specimens of carving in various parts of the screen. For this addition to the artistic attractions of their church the congregation are indebted to Councillor G. H. Johnstone, he having caused it to be erected as a memorial to his late wife, who took a deep interest in all matters relating to the church. The oak screen has been made by Messrs. Jones & Willis, of Edmund Street, Birmingham. The work was executed from the designs of Mr. John P. Osborne, architect, Colmore Row, Birmingham.

COLSTON HALL, BRISTOL.

THE following account of the origin of the building which was destroyed on the 1st inst. is given in Latimer's "Annals of Bristol":—

Upon the removal of Colston's School from St. Augustine's Place, the vacated "great house" was purchased by a few public-spirited gentlemen for 3,000*l.*; and the Colston's Hall Company, with a capital of 12,000*l.* in 10*l.* shares, was formed in November, 1861, for the purpose of constructing an edifice worthy of the city. The demolition of the great house took place in May, 1863, and shortly afterwards the directors of the new company entered into a contract for the erection of the large hall for the sum of 17,000*l.* The hall was opened on September 20, 1897. The cost greatly exceeded the estimates, and so completely exhausted the resources of the company that the directors were unable to proceed with the other portions of the building. In 1869 a further sum of 15,000*l.* was raised through the zeal and liberality of some ten or twelve of the original promoters, and the structure, in the complete form designed by the architect, was completed in February, 1873, the aggregate outlay having been 40,000*l.*

The Colston Hall premises consisted of a large hall, which would accommodate 2,250 persons in the body and galleries, and 400 additional in the balconies and orchestra, or 6,000 standing. It was 146 feet long, 80 feet wide and 70 feet high, and there are two other halls, one with sitting accommodation for 700, the other on the ground floor for 400. The organ in the great hall was by Willis, of London; it had four manuals and sixty draw-stops, was blown by three hydraulic engines and cost over 3,000*l.*, and was constructed in 1870. Four medallions of citizen shareholders—Conrad Finzel, George Thomas, Henry Overton Wills and Robert Charleton—were placed in the spandrels over the arches of the great hall.

EMPLOYERS AND EMPLOYED.

(*Concluded from last week.*)

WHAT impressed the German socialists—Marx, Lassalle, Engels, Kautsky—was the demonstrably economic character of many political changes of the last 300 years. In the course of industrial changes the Mediæval landowners gave up their power to the capitalists, and the capitalists to the employers of labour. Therefore, said the German socialists, all is due to a change in the prevailing form of production. Where agriculture prevails we have a territorial aristocracy, a certain political system, and certain social institutions and laws; where commerce prevails we have another system; where manufacture, a third. This explains the rise of the middle classes into political power, but also the advance of the working classes as a power that will displace them and be (as we are told it ought to be) all in all. As in the economic theory of Marx and Engels all value is from labour, so on the great scale of politics all power is to be with the labouring

class. Economic progress is thus the only real progress; the essence of all history is economics; the essence of all economics is labour. The steps of the progress (we hear with mingled feelings) will be for the whole world what they have been for England, the harbour of the exiles, and the steps will be taken without deliberate human contrivance. We may look forward to the changed order as better than the present, but we cannot either hasten or retard it; it will come of itself. We cannot by taking thought add a cubit, or even an inch to our stature.

The German socialists have not had the gracelessness to live up to this comfortable doctrine; they have agitated like other people, preparing the way for a change while declaring that it cannot possibly be hastened. Not agreeing with them in the least in their doctrine of helplessness, most of us will welcome and commend their inconsistent efforts to make the world better than it is, and they have fairly earned exemption from the title of mere theorists.

The Italian form of the materialistic view of history has been expounded with great ingenuity and learning by Professor Loria. It has excited interest chiefly in academic circles, but need not be disparaged on that account. His theory is that all progress is economic, and all economic change is due to the land and the growth of population thereon. He thinks that so long as there is free land or abundance of room as well as food men will themselves be free. No one will be economically weak if he has always the option of working as profitably for himself as for another. This is true, and we have had recent instances. Khama was afraid to sell his land lest he and his should become mere hewers of wood and drawers of water to the white men. The same notion seems to have prompted the recent resistance to the hut tax in Sierra Leone. Professor Marshall, in his address to this section in 1890 at Leeds, recalled to us the difficulty felt in the United States fifty years ago by employers who imported English workmen for their Eastern factories; the workmen moved west to become free settlers. But Professor Loria tells us besides how the land ceases to play this part. The growth of population leads to the disappearance of free land, and therewith of the independence that went with it. The growth of population even now leads to the pressure felt both in cities and in country districts. It affects the higher or protected or propertied classes; they need to fence themselves about with "connective institutions" that support their rights of property. It leads gradually to a less and less profitable production from the soil, and therefore to a less and less profitable investment of capital. These effects, in their turn, lead to a greater power of combined labourers against the employer. Professor Loria expects in the end the victory of the combined labourers, since, happily, the men of property are divided among themselves—agriculturists against manufacturers and traders, for example—and there is a division of the revenue. In the end there will prevail a form of co-operative labour. The labourer's option will be restored to him (though hardly, we may presume, in the form of free land), and dependence in the obnoxious sense of economic weakness over against economic strength will vanish. The Professor agrees with the Germans that we cannot work out this salvation, or even hasten it. We can only stand at a distance and behold the Promised Land.

That some such consummation is devoutly to be wished, and even perhaps hopefully to be expected, is probably the conviction of many who do not encumber their belief with a materialistic view of history. Instead of the material changes bringing the moral transformation, we may think that the moral and intellectual changes are a condition of the material reform. It seems to us to have been so with ourselves in past times. We never work better than when we believe that our future depends on ourselves, and we have not simply to wait for it. Marx and Loria allow that the automatic establishment of better conditions of life is slow and irregular. They say that the laws and governments of all civilised countries are obsolete, and yet persist in being. Surely, then, we might argue, there is there a strong force acting against the overpowering economic causes? Are we to wait till these old-fashioned fortifications fall down to the sound of our trumpets? Of all reformers the most irritating are those who tell us to do nothing lest we should make a mistake, but next should come those who tell us that even our mistakes can have no effect whatever. If it should appear that there is more in the way than obsolete laws, and that the laws persist because the manners and customs of the people are set fast in the same groove as the laws, then no inarticulate and spasmodic shouting should content us; we shall need the help of patient and intelligent teaching. Transformation of manners and customs can be accomplished slowly but surely by means of ideas, by the spoken word and example of life and instruction of manners. Such means have been found needful to give a people its first organisation, and will be needed, even in practical England, to organise them for the final reform, if it be the final.

We are probably too hasty, even the oldest of us, in talking of final reforms and final stages in development. We know

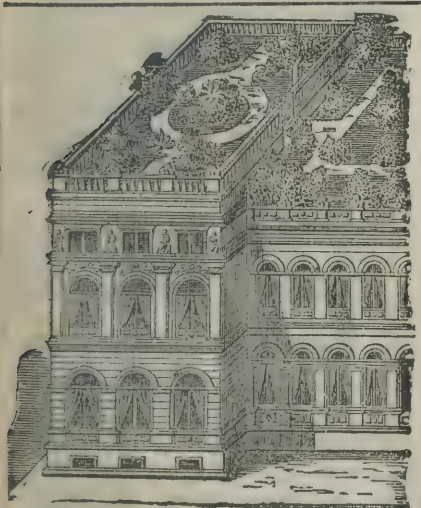
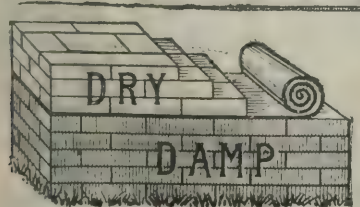
little of development and nothing of finality. Our experience is that every stage in civilisation, or even in economic theory, is temporary as a superstructure though permanent as a foundation. Perhaps it is the most certain fact of the future that our best economic writings of to-day will then be dismissed as antiquated and their diction slighted as careless English of the nineteenth century. It needs no great gift of prophecy to foresee that a hundred years hence our industrial conditions will have been much altered. The resident domestic servant, much talked of in Bristol in 1875, will probably be no longer resident. Production will be more democratic; it will be almost entirely of articles used by the masses, and hardly at all of luxuries for the rich, high wages in this way becoming really high. Working men and employers will meet on more equal terms. Whereas even now we use the term "master" with timidity, it will by-and-by be as wrong scientifically as "the sun's rising," though both may remain current in the poetry of popular language. Our posterity may be living under a system of low interest, small profits, high wages and great companies. Possibly the great companies will pass into the co-operative societies of Professor Loria's vision. It is to be feared that the advent of these to supplant other forms of industry is not very near. Professor Pantaleoni considers that their present counterparts have nothing in principle and method to distinguish them from ordinary ways of money-making. Their triumph, however, would mean a very desirable shifting of the balance of industrial power. So far as can be seen, and we have cases in point very close at hand, a long discipline and much instruction, and many unsuccessful trials will be needed before working men will follow leaders of their own choosing as obediently on the whole as they now submit to the direction of their employers in their industrial work. But it is an acute remark of De Tocqueville, repeated by M. Tarde, that when the "lower" classes begin to imitate the "higher" the distance between them must have become short, and equality must be coming near. This imitation has actually begun to take place in business as well as elsewhere. Book-keeping and knowledge of the markets are no longer the secret of the middle classes, as knowledge of the law was once the secret of the upper. Working men have shown already, in some few instances, that they can carry on a manufacture as well as a trade; and if the tyranny of great companies became intolerable we might expect that an attempt would be made all along the line to replace them by some scheme or schemes of co-operation. If such schemes were established forcibly, which is not probable in this country, we might look for a tyranny of the majority followed by a reaction, for the rule of the best leaders has its abuses like that of the best masters, and human passions seem to be more permanent than any industrial system. If such schemes were established gradually and from beneath, they might last till a better system came into view. The voice of reason and public spirit will not be fainter then than now, and will prevail even against the ruling passions of the ruling class.



We cannot be definite in a forecast of the distant future. But it is surely not irrational to look for a larger diffusion of independence, in the sense of really mutual dependence, with a wider distribution of wealth. When dependence is mutual its sting is gone. In the future the really dependent men will probably be the incapable men or else the men that have high capacities that are not at the moment wanted, while they have no secondary or second-rate powers on which to fall back. These two classes will give the future two problems to solve in place of some that now trouble us, but are ready to vanish away. The solution may be the public support of both classes of dependants—of the first because they are too bad and of the second because they are too good, to work on exactly the same footing as their neighbours.



MUNICIPAL TRADING.

THE subject of the limits of municipal trading was considered in the Section of Economic Science and Statistics at the meeting of the British Association on Monday, the 12th inst.

The first paper was by Mr. George Pearson, who, speaking from his personal and official experience in the city of Bristol, set forth his views on "Municipalities as Traders." He was an advocate, from what is now called the progressive point of view. He urged, in particular, the desirability and even the necessity of the performance of several duties which were formerly considered appropriate only to private effort by municipalities. Municipal trading had in recent years grown to an enormous extent, as was shown by the great growth of municipal indebtedness, which to a great extent was now represented by trading concerns in the hands of municipalities. In his opinion municipal trading should be confined to the provision of those necessities of civilisation which were so large as to be beyond the power of individual effort adequately to

PATENT
VULCANITE ROOFING.

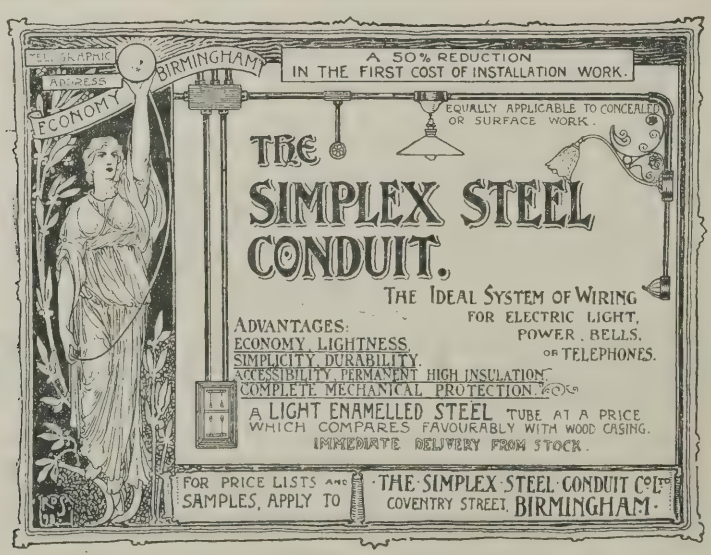
Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.



THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

supply, and did not form part of any Imperial Government department. He discussed the advantages and disadvantages of private, of company and of municipal trading, and pointed out that there were causes which might drive municipalities to trade to a far greater extent than they were now doing. There were, however, he admitted, disadvantages of such trading, inasmuch as it involved the employment of a large number of workmen, and the employers were popularly elected. The paper concluded with a discussion of the report of the telephone committee, particularly with respect to the widely entertained opinion that municipal bodies ought not to trade for profit.

Mr. Edwin Cannan read the next paper on the question, "Ought Municipal Enterprises to Yield a Profit in Aid of Rates?" Such municipal enterprises had, he said, been likened to joint-stock companies, the ratepayers being the shareholders. If the parallel were exact, there could scarcely be any question about the propriety of municipal enterprises yielding a profit, since to make a profit was the object of a joint-stock company. How far, then, did a municipality resemble a joint-stock company? In form the two bodies were very much alike, the management of both being committed to an elected council or directorate, and the ordinary members only interfering on rare occasions directly, though the citizens or burgesses exercised far more influence on the decisions of their representatives than the shareholders. But the basis of membership was very different. The business of both the company and the municipality was economic work for the benefit of their members, but the company performed services for outsiders and distributed profits in money dividends to its shareholders, while in performing its ordinary functions the municipality provided commodities or services for its members directly, and consequently had no opportunity of making profits to be divided among them in money dividends. As far as municipal enterprises were concerned, however, the position of the municipality resembled that of the company much more nearly. Municipal enterprise was distinguished from ordinary municipal work by the fact that the commodities or services which it provided were supposed not to accrue to the citizens approximately in proportion to the rateable value of the property with which they were connected, so that it was considered necessary to charge for them by methods and standards different from those which regulated the levying of rates. By hypothesis, then, the business was no longer a merely "mutual" one, in which each member received direct benefit in proportion to his share, but a business like that of an ordinary company. The municipality ought to be allowed to make a profit for the same reasons as a company was allowed—(*a*) in order that it might have some inducement to undertake the enterprise which it would not have if it must take all the risk of loss and no chance of gain, (*b*) in order to secure efficient management, and (*c*) in order that the economic proportion in the production of different commodities might not be disturbed. The arguments against profit-making in municipal enterprise seemed to be founded on an antiquated socialism or on a false analogy, either from co-operative institutions or from ordinary work. That there might be cases in which it was not economically desirable that the highest possible profit should be made was probable, but these cases were far less frequent than was supposed, and since when they occurred the damage must be much greater to the locality than to the country in general, and also be tolerably obvious, there seemed no need to restrict the freedom of the locality.

Mr. W. M. Acworth read a paper on "Rectification of Municipal Frontiers," in which he considered certain recent developments in the life of our great towns tending in the long run to an important readjustment of frontier between private and municipal enterprise. Gas and water supply had, he observed, long been regarded on the ground of their general necessity as natural subjects for municipal ownership. Oddly enough, however, it was reserved for a commercial company—the South Metropolitan—to make gas really available in the poorest house by the adoption of the penny-in-the-slot system. But with the rapid advance of rival methods of lighting—petroleum, electricity and now perhaps acetylene—coal-gas was much less a general necessary of life than it was. Simultaneously there had been a rapid advance in the use of coal-gas as a source of power. In America they were building gas-engines of 700 and even 1,000 horse-power. It could hardly be contended that municipal management, with its inevitable rigidity and slowness of method, was better fitted than private enterprise to supply gas-power in competition with power derived from other sources. The supply of water few would deny in the abstract to be a natural subject for public ownership. For all that, the question of delimitation of frontier, not between private and municipal ownership, but between the rights of different local authorities, arose in this matter also. For example, the position of the water committee of the Birmingham Corporation was, from one point of view, hardly constitutional. It was responsible wholly to the ratepayers of Birmingham, while to the residents 100 miles away in the sequestered Elam Valley it appeared in the capacity of universal landlord and sole

employer of labour, not to mention sole public-house keeper. But it was not by water that the boundaries of municipal enterprise were likely to be undermined. A House of Commons committee had just reported that competition in telephone service was desirable, and that where the Post Office did not compete with the National Telephone Company licenses might reasonably be granted to the local authority. So, as the corporations of Edinburgh and Glasgow had already applied for telephone licenses, municipal telephones would soon probably be tried on a considerable scale. It was questionable, however, whether it was not being begun too late. Though 95 per cent. of telephone messages were said to be local, this proportion was not likely to last much longer. In America long-distance telephony had already developed to a point where it had seriously affected the receipts on the through express trains between New York and Boston, and even between New York and Chicago. Electric lighting had from the outset been a mixed service, in the hands here of a company, and there of a municipal corporation, subject to this—that the corporation had always been given the refusal before the company was admitted. But in practice the competition had been of companies *inter se*. Last session, however, saw a change. Two local authorities sought, and one of them obtained, statutory power to compete within their district with companies already in possession of the field. But, seeing that the companies possessed greater elasticity and adaptability of management, and were not hampered by municipal—which were very often non-natural—boundaries, in some cases the competition would probably be effective. But this was not all. When the Electric Lighting Act of 1888 was passed, electricity was almost exclusively regarded as a source of light. This was no longer so. A joint committee of the two Houses of Parliament investigated last session the new problem of electric energy in general, and a single company, the General Power Distributing Company, proposed to produce electricity on an enormous scale at the pit's mouth at Warsop, in Nottinghamshire, and thence to distribute it by trunk cables over 2,000 square miles of country, along the roads of 120 different local authorities, including the great corporations of Sheffield and Nottingham, and then to sell it in any quantity, for any purpose, and to all classes of consumers. This particular scheme had not yet been sanctioned by Parliament. Not unnaturally the local authorities, especially when, like Sheffield, they owned electric-light works, were up in arms against it. But on the general question the opinion of the joint committee—a very strong one—was dead against them. Evidently there was here a big question opened, which would not be settled in its detailed application to the different parts of the country for many years to come. The accepted tramway policy of the country was also rapidly being dissolved by electrolytic action. In the whole of Great Britain, with its forty million inhabitants, we had about as many miles of tramway as the two cities of Philadelphia and St. Louis. Nor was this all. Eighty to 90 per cent. of this insignificant mileage was still worked by horses. The rest of the civilised world had long ago adopted electric traction, by which in the United States alone over 15,000 miles of line were now being worked. In London in particular the adoption of overhead electric traction has been absolutely blocked by the action of the County Council, in one case at least contrary to the unanimous representation of the local vestry. A House of Commons committee this session gave a decision in the case of the London United Tramways which practically amounted to notice to the London County Council that they must make up their minds to exercise their veto power less absolutely or it would be withdrawn from them. But this was only one side of the matter. With the advent of electric traction, tramways had been extended in other countries, and were even now beginning to be extended in England, far beyond the borders of individual towns. Had Bath and Bristol, for instance, been situated, not in England, but in Massachusetts, they would long ago have been connected by a tramway service, with cars starting every few minutes, running from town-hall to town-hall in three-quarters of an hour or less, at a through fare of certainly not more than 15 c. Now such a service to be efficient must be worked in one hand. Could it be imagined that this hand could well be a joint committee of the counties of Gloucester and Somerset and the corporations of Bath and Bristol? The present tendency for corporations to work their own tramways was likely, therefore, to be counteracted, if not actually overborne, ere long by a tendency to adopt the course which a special commission of the Commonwealth of Massachusetts—a state in which the capitalist had never been allowed to have his own way unrestrainedly—had just, after a careful study of European experience, recommended, namely, that whoever be the owner of the tramway, its working should at all events be entrusted to commercial undertakers. In conclusion, he submitted that the ever-increasing specialisation of science, coupled with the ever-increasing interdependence of independently organised local government districts, all tended towards a readjustment of the

boundaries of direct municipal activity, and that this readjustment was likely to be, on the whole, in the direction of extending rather than restricting the public functions allotted within the municipal area to commercial enterprise.

Mr. Macdonald said that where the municipal enterprise was mainly for the advantage of individuals a profit might reasonably be made, but where the element to be almost exclusively regarded was the common use of everybody no such profit should be made. In the former class might be placed tramways, and in the latter the roads and streets. Municipal telephones he held to be a mistake. They should all be in Government hands.

Mr. George Iles, of Montreal, said that in Canada the municipality shared in the profits of the tramway companies, and special advantages were given in Montreal to school children and other regular users of the lines. The work was better done by the companies than it could be by the municipalities. In Bristol, he believed, the gross daily receipts of the Bristol tramways were about 250*l.*; those of Montreal, which had a population of about five-sixths of Bristol, were some 4,000 dols.

Mr. Scott, of Toronto, said they had adopted the principle of private enterprise subject to comprehensive municipal control. The telephones were made like the tramways, to contribute to the rates, though disputes had arisen, and the municipalities declined to undertake any burden in respect of them. On the whole, municipal management had been found less satisfactory than that of commercial companies. In New York and elsewhere the underground trolly was found the most effective, and was displacing the cable, and it was felt that the overground system was doomed.

Mr. F. Thompson said at Croydon they had water and electric lighting in the hands of the municipality, and expected to make a profit by the latter.

Mr. Hooper thought the profits of municipal enterprises should be limited to moderate dimensions.

Mr. Charles Thomas, deputy-chairman of the Midland Railway, was afraid that the labourers of municipalities might create discontent and jealousy in the labourers of private employers.

Mr. R. C. Miller pointed out that most of these enterprises involved interference with the streets, which were vested in the public authorities, and that was some reason for their acquisition by corporations. The case of water was different, as its insufficient use by individuals was a source of positive danger to the community. The difference of municipal indebtedness—92 millions and 235 millions between 1872 and the present time—needed careful examination, as it might, if large portions of capital had been repaid, really indicate an increase of municipal wealth.

Mr. Pearson, in reply, said that there was more to be feared from a combination of masters than from combination among men, and that was a reason which made him in favour of the extension of the municipal sphere.

Mr. Cannan deprecated the enunciation of any abstract dogma or principle on these complicated matters.

Mr. Acworth also briefly replied.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

THE WEEK.

A NEW agreement has been concluded between the municipality of Rome and the Anglo-Roman Illumination Company for the supply of gas and electric light. The price of gas has been reduced for the municipality to 18 c. per cubic metre, as against former rate, 25 c.; for private consumers 21 c. per cubic metre, as against former rate, 29 c.; and it will be further reduced in 1903, 1908 and 1913. Gas for heating purposes, motive power, &c., will be paid for both by the municipality and private consumers:—From July 1, 1898, 16 c. per cubic metre, as against 22 c. former rate; from July 1, 1908, 15 c. per cubic metre; from July 1, 1918, 14 c. per cubic metre. The price of electric light will be for arc-lights for municipality, 30 c. per hour, 14-ampère light, as against 40 c. hitherto, to be reduced after five years to 29 c. per hour, and after ten years to 28 c. per hour. For incandescent light, both for the municipality and private consumers, 7 c. per hectowatt per hour, as against 11 c. hitherto; 6½ c. per hectowatt per hour from July 1908, 6 c. per hectowatt per hour from July 1918. The company has bound itself to establish within eighteen months a fresh connection with the Tivoli Electric Works, by means of which an additional supply of electric energy of 1,500 horse-power may be secured to Rome. Arrangements to further utilise the hydraulic power available at Tivoli are also made so as to be able to dispose of electric energy amounting to 10,000 horse-power, whereby they can meet all requirements for illumination, tramways or industrial purposes. Who could have anticipated that the waters of the Anio, which were once sacred to Neptune and the Sybils, and which so many Roman and other poets have eulogised, should be at last utilised as a motive-power to drive engines?

A FEW years ago the medal for archæology of the Société Centrale des Architectes was awarded to Father LA CROIX, a Jesuit. He devotes himself to investigations in France and appears to have almost an instinct for discovering the foundations of buildings of which no trace is visible to ordinary eyes. Latterly his attention has been given to the western districts of France. He has almost terminated an exploration of the abbey of Saint-Maur-de-Glanfeuil (Maine-et-Loire). The abbey is supposed to have been one of the earliest in France which belonged to the Benedictines. It has been said that the Rule of the Order is in itself a monument, the foundation itself being discipline and the coping stone labour. The members rendered great services to art, for, according to M. ALBERT LENOIR, "St. BENEDICT soon added to his rule a decree providing for the teaching and study of architecture, painting, mosaic, sculpture and all branches of art; and it became one of the most important duties of abbots, priors and deans to make designs for the communities and auxiliary buildings of the churches they ruled." One of their principal schools of art was the abbey of Saint-Gall. The abbey of Saint-Maur-de-Glanfeuil apparently did not attain so much importance, but there are many reasons which make it desirable to have a plan of the buildings. It is often referred to in monastic chronicles, and the question to be settled is whether what is said was in any way imaginative. According to Père LA CROIX the descriptions are confirmed by his excavations. He intends to publish a monograph on the abbey, which will be accompanied with plans.

THE Opéra-Comique in Paris will be an expensive building. It is now approaching completion, and in addition to the sum expended a definite estimate can be given about the work which has to be executed. The sum named officially as the total cost is 4,420,000 francs, or nearly 180,000*l.* When in 1893 the rebuilding was definitely decreed by the Chambers the outlay was fixed at 3,500,000 francs. It was afterwards discovered that the sum was insufficient, and supplementary votes were passed warranting an expenditure of 920,000 francs. It remains to be discovered whether it will not be requisite for the Legislature to display additional liberality. It must be allowed that the whole of the 4,420,000 francs will not have to be paid by the French people. The amount of the insurances received was 1,074,000 francs, which sum suggests the value of the former building. The Opéra-Comique in Paris has had experience of many habitations. Originally the Théâtre de la Foire, the privileged booth was set up on the site of the existing market of Saint-Germain. Then it was transferred to the Faubourg Saint-Martin. Early in the last century the direction was obtained by Madame FAVART and her husband, and a new era commenced. They attained so much success that the patentees of the other theatres conspired to have the Opéra-Comique suppressed. In 1762 the Comédie-Italienne amalgamated with it, and the performances were held in the Hôtel de Bourgogne. A building for the performances was erected in 1783 on the site where the new Opéra-Comique stands. Next there was a removal to the Salle Feydeau, then to the Salle Ventadour, then to a building which occupied the site of the present Vaudeville. In 1840 the building was opened as the Opéra-Comique, which was destroyed a few years ago, and which was known as the Salle Favart. Amidst all the removals the style of performance has become dearer to Frenchmen.

IT will not excite much surprise to learn that the block called Abbey Mansions, Westminster, was on Wednesday condemned by a committee of the London County Council. An attempt was made to construct a new roof in place of that which collapsed with such fatal results. But as it was discovered that the foundations were unstable orders were given immediately by the authorities for the diversion of the vehicular traffic along Victoria Street. It was apprehended that vibration would bring down the walls. Application was also made to the magistrate for a peremptory summons against the owners. Hitherto, owing to the building having been leased by the Office of Works, exemption from the usual rule relating to buildings vested in or in the occupation of Government has prevented the block from being subjected to the usual procedure relating to dangerous structures. But the public safety overrides such a privilege. The loss will be probably 95,000*l.*, but if people will go to the Royal College of Art for architects they must abide by the consequences.

THE old song of AUTOLYCUS, "Jog on, jog on, the footpath way, and merrily hent the stile-a," expresses a national feeling. English people when on foot prefer footpaths to high roads although stiles have to be crossed. The paths suggest that common folk have still some claim on land which belongs to others, and that property brings duties as well as rights. In Ireland, where landlords claim to be of a higher species than the majority of the people, footpaths are rare, and that fact suggests one of the differences in feeling between the inhabitants and those of England. In several parts of England the Parish Councils Act was used to improve footpaths and stiles. There is no doubt the inexpensive work helped to remove some of the objections to the new order of things. An auditor in the north of England has disallowed the expenses when they came before him on the ground that the repairs of stiles and gates should fall on whoever repairs the fence, as they are part of it, and not of the footpath. What would AUTOLYCUS have said to such an interpretation? The Local Government Board were invoked to interfere, and fortunately the President (Mr. CHAPLIN) is acquainted with the conditions of country affairs. The auditor's decision is to be reversed. The Board are of opinion, speaking generally, that, "where an existing stile or gate on a public footpath in a rural parish having a parish council is in so defective a state as to make it necessary for the public convenience in the use of the path that such stile or gate should be repaired or removed, the parish council can, under subsection 2 of section 13 of the Local Government Act, 1894, effect such repair or removal and substitute, without the consent of the owner of the soil, a stile or gate giving equal facilities to the public using the path, and that a parish council may substitute gates for existing stiles if they obtain the consent of the owner of the soil to the consequent enlargement of the rights of the public." If paths and stiles belong to the public, as was the general belief, it is only fair the public should repair them.

ARCHITECTURAL COMPOSITION.

THE new number of the American *Architectural Record* opens with an article by Mr. John Beverley Robinson on "Principles of Architectural Composition." It is not put forth as expressing anything like a complete theory of composition, for the author's aim was "only to put together in a coherent form some practical generalisations, to aid the student by formulating in words what he must otherwise acquire by a slow process of unguided observation." Whether completely or partially treated, there is no subject which has more interest to the student of architecture. It is also one which is rarely attempted, and in that way it resembles another subject which has many analogies with architecture, viz. literary composition. An unsuccessful novelist may occasionally propose to set up as a teacher and to advertise "Novel-writing taught in ten lessons," but the certainty of failure usually puts an end to the experiment. The ordinary guides to authorship are not calculated to enable purchasers to write a successful prize essay. Architects appear to act in a similar spirit and will write on a variety of subjects, but that one which should be most familiar to them is avoided. We must, therefore, admire Mr. Robinson's courage in taking up the office of teacher, which daunts so many of his fellow architects.

The first question to be considered, in dealing with most subjects, is that of limitation. The wildest imagination must submit itself to restraint or it becomes lunacy. Icarus dare not soar too high unless he wishes his wings to melt and destruction to follow. The architect has to curb his invention, and cannot allow it the liberty which is desirable for creation. As Mr. Robinson says:—"Nowadays an architectural form rarely seeks expression, except as including some useful purpose. Formerly, when architecture was chiefly employed in building houses for the gods, utility counted for less; next to the satisfaction of the eye, the sentiment of reverence chiefly needed to be gratified. But now we must build houses and town-halls and office buildings and put forty windows where we would rather have but four, and make our design out of such mundane needs. Sentiment, too, must be taken into account—if not religious, perhaps domestic, as that of public pride or private ostentation. A hundred utilities and a score of sentiments arise for us to satisfy. Next to this comes the constructive sense, which even in the unprofessional mind shrinks from a post that seems too slim, and, in the professional mind, objects to an arch with too slight abutments. Then again, there is a sentiment with regard to material, which prefers stone to brick, bronze to iron, marble to plaster." Plan is so closely connected with utility as to be identified with it, and the relation between plan and design is of course of paramount importance in the art. Mr. Robinson explains the connection by saying "design should spring from the plan, but it must spring from it, and not remain nothing but plan."

Assuming that pleasure is the end of art, he says that unity and grace must be manifest in every example, one being the manifest connection of all the parts in the whole, the pleasing form of the parts so connected. Concerning unity, he says:—

> The quality of unity is essential to all objects of art and to all parts of each, and it constitutes the greater part of architectural design. In architectural composition there are two principal processes, in which considerations of unity are paramount—the assemblage of parts that are side by side into a whole, which we may call grouping, and the separation of the building as a whole when it is a single mass, or of each of the component parts when it is a group of masses, into parts disposed one above another, which we may call subdivision—limiting the word arbitrarily to horizontal subdivision and keeping the word "grouping" to describe vertical separation, even when it seems to be rather the division of a whole into parts than the assemblage of parts into a whole. After the arrangement of the main masses of the design comes a similar process with each part of which it is composed, whether vertically or horizontally; and the grouping of details—windows, columns, turrets and the like—for each part upon the same general principles that applied to the whole.

Mr. Robinson, by the aid of a few diagrams, suggests how a single mass or group of two masses becomes transformed by horizontal subdivisions or storeys which are again divided into a series, and tells us "we are to consider, first, the number of principal parts that may compose a group and their sizes in relation to each other; next, the number of subordinate parts which should be grouped, as details, upon the main mass or masses; then subdivision horizontally must be investigated in the same way as to both the number and size of parts.

Arthur Helps, in writing about literary composition, referred to the almost superstitious reverence which writers appeared to have for the number three. That respect has come down to us from the earliest rhetoricians. In order to persuade we are to please, to convince, to move or excite; a discourse is to consist of exordium, confirmation, peroration; there are three styles, simple, temperate, sublime; three varieties of discourses, demonstrative, deliberative, and judicial; and so on. Mr. Gladstone's "three courses" was only a parliamentary application of an ancient rule of thumb, as the three-volume novel was in another sense, and it would be hard to say where triune power is not exhibited in some form. Architecture is not an exception, for the Greeks were supposed to be unable to get beyond three orders, while the Mediævalists had to be satisfied with three periods. It will accordingly excite no surprise when Mr. Robinson declares that "in all designs of form, whether it be the design of a finger ring or of a cathedral, there are but three groupings that give satisfaction to the eye by a sense of unity." His three rules are "One thing looks well. Two things look well together. Three things look well together"; and he adds, "These three rules are the foundation of the art of grouping; all the rest is but to learn ways of doing what these require, when other considerations interfere; of reconciling them with situation and use and other modifications and adaptations." Among the single masses he includes the Colosseum, Parthenon, Baptistery of Pisa, and Cheops's Pyramid, the Panthéon, towers of Notre Dame, the Falcon Coffee House, Chester, the west gateway of Lincoln's Inn; coupled columns, doubled windows are among the dualities; and his groups of three comprise the Karnak Temple, Ferrara Cathedral, the Escurial, &c. It may be objected that there are buildings with more than three domes and groups of more than three windows, arches, gables, &c. Mr. Robinson replies:—

> It is strictly true. Just as soon as we pass three, we begin to lose the sense of a definite number, bound together into a group, and to feel only the vague sense of an indefinite number of things placed upon another object. Four dormers or four windows, or as many more as we please, we may have, but as soon as we pass three, we begin to lose sight of the dormers as objects themselves, and to think of the building as a whole decorated by a row of an indefinite number of dormers. And so used, multiplicity of subordinate parts is of value in giving continuity to a larger object, and is used in certain situations. But for plain masses that stand up asserting themselves as independent objects, four is a combination that cannot be made to look well. It is almost impossible to find an actual instance of four grouped masses that affords a fair illustration. In most cases either the body of the building so much predominates that the four towers, or whatever they may be, fall into subordination as mere sub-masses, or a simultaneous view of all four is impossible, one or more being cut off by perspective.

In English church towers the monotony of the four pinnacles was sometimes avoided by making one of larger size. The view of the Church of the Nativity of the Virgin in Moscow proves that a group of five spires, although slightly differing in form from being similar in size, becomes barbaric. Therefore, concludes Mr. Robinson, "in shaping our first thoughts of what our plan is to be, we must remember that the outside, whatever be its character, must consist of not more than three leading parts. If we are going to have high roofs and gables we may have a single gable, or we may have two unequal gables, or two equal. Or if we find that three will suit our purpose better we must make the flanking gables either equal or unequal, and the middle larger than either." But it is well to remember that with three parts perfection is not always secured. Lichfield Cathedral becomes less effective from the close resemblance between the three towers and spires. Lisieux Cathedral, on the other hand, is not satisfactory because the two towers differ so much in the appearance of the belfry windows. In St. Paul's Cathedral there is no correspondence between the dome and the western

towers, yet the impression is not unsatisfactory. The reason is, according to Mr. Robinson, that "the dome appeals to the eye as the single feature of the building in any comprehensive view; the towers are so much less that they fall in with the mass of the building as a base for the dome. The bigger the one thing, the more and more various things may cluster around it unnoticed, except as part of the mass upon which the big thing rests. Only when we come closer and begin to lose sight of the dominant mass from very nearness, the smaller must begin to group themselves by ones, twos and threes, clearly and coherently, as do the westerly towers of St. Paul's as we approach." Accordingly, three additional rules are laid down by Mr. Robinson, viz. :—"In double grouping, whether of equal or unequal objects, the members must be alike. In triple grouping either the members must be alike or the central must be much the largest. A group of any number of members may be harmoniously constructed by making one object very much the largest and letting the others fall into subordinate groups, but always by twos and threes, as if they were single."

One of the bequests we have received from Gothic architects is a desire for variety, and it is exemplified in a great many modern English buildings. If it were not for the necessity to be economical and to facilitate the use of machine-made goods, there would probably be more indifference to unity exhibited. It is well to have it explained that repetition is not necessarily a great evil, although where allowed to become monotonous it cannot afford any pleasure The skill of the designer is seen in steering between the too little and the too much. A writer is allowed to select the evidence which he considers most cogent for the purpose he has in view, and Mr. Robinson has availed himself of the privilege. But the student will find it advantageous to apply the rules to examples of a different kind. He may then discover that while they are often applicable there are cases where they were disregarded without fatal consequences to the buildings.

TESTS OF VENTILATION.

In spite of what is often said by philanthropists who are more liberal with blame than with money, there is no country where the poor receive such care as in England. In the days of Oliver Twist there may have been indifference which led to cruelty, but in our time, happily, the children who dwell in workhouses receive kindlier treatment than is obtainable in many private schools. The interest which is now taken in them is suggested by the "Report to the Local Government Board on the Ventilation and Warming in certain of the Metropolitan Poor Law Schools," by Mr. William Napier Shaw, M.A., F.R.S., lecturer in experimental physics in the University of Cambridge. It shows that a prominent man of science can be sent to examine every room in which children are placed during day or night, the workshops, infirmaries, dining-halls, chapels, in order to ascertain whether there is any place where the provision for heating and ventilation does not correspond with the latest conclusions of science. A survey of that kind can be done by an expert in such a way that the results will fill no more than a couple of printed pages. But Mr. Shaw believes in the necessity of giving exact details in order to enable others to test his conclusions. Accordingly he has recorded the length, breadth and height of each room, the number and aspect of the windows, the inlets and outlets for ventilation apart from windows and fireplaces, the mode of warming, the head (if any) for ventilation other than that of wind or of chimney-flues, and in the majority of cases he appends notes and remarks of various lengths. As the number of occupants is supplied, little more than a glance at the elaborate tables is needed in order to ascertain whether a particular room, hall or workshop is in a sanitary sense adapted to its requirements.

Although the Metropolitan Poor Law schools are, as it were, put under the microscope and subjected to a scrutiny which could not be anticipated, it must be allowed, in the first place, that there is no evidence of neglect on the part of the Guardians. The provisions for ventilation and warming may not be adequate, but there is no doubt enough money was expended to secure efficiency. The Local Government Board will, we suppose, offer some recommendations which will be based on Mr. Shaw's tables, but it cannot be said with justice that the Guardians were neglectful or caused illness by their penuriousness. They are, however, responsible for the conduct of their officers, and on their account the Guardians must expect to be reproved.

The truth is, that means for ventilation and warming are rarely appreciated by those who have charge of buildings. It is well known that inlets and outlets too—for caretakers are not always able to discriminate between them—are shrouded by old rugs or stuffed with rags in order to make them innocuous, for it is believed they not only allow entrance to dust and increase the labour of cleaning, but are an unfailing cause of colds and rheumatism. No one who has to examine buildings of more pretensions than workhouses will be surprised at the instances recorded by Mr. Shaw of what is a conspiracy against appliances for ventilation. His observations abound in such cases as follow :—"Many of the air-gratings at ground floor are being overgrown with ivy." "Birds'-nests in some of the grids." "Floor ventilators obstructed by paint and full of fluff." "Perforated zinc skirting very much obstructed by paint." "No indications of flow at opening of extraction shafts." "Perforated skirting has in all probability become very foul in the course of time, and certainly was so at the point tested; from the point of view of the spread of disease, it is a source of danger unless it be cleaned and recleaned periodically." "The strips of perforated zinc leading to floor joists seem to be of no possible use." "Outer end of shaft occupied by birds'-nests." "Tubes and valves are probably much choked with growth of ivy outside and accumulations of dust." "Many ventilators are blocked with dust." "Ventilation grating boarded up." "Extraction shafts much filled with birds'-nests." "Extract flue very full of dust."

A great many large buildings in London which are occupied as offices or residential flats would be found, if as carefully examined, to be in a similar condition to the Metropolitan Poor Law schools. As a consequence, complaints are made about the uselessness of appliances for ventilation. The inactivity is not the fault of the appliances, but of the caretakers, who, as we have said, have a prejudice against whatever is supposed to increase the cost of cleaning. It is never likely to be otherwise. On that account it would be an advantage if arrangements were made with the firms who supply ventilators to keep them in a state of efficiency on the payment of a fixed charge. In no other way are the birds'-nests, ivy, fluff, dust and other impediments to the free passage of air likely to be removed. We too often forget that a ventilator is a machine, and only by carefulness can it be kept in a condition of activity.

In another column we have extracted those parts of Mr. Napier Shaw's report which form an exposition of his views on ventilation. It will be observed that he sets a high value on the "head" which is to force the air in and out of the room which has to be ventilated. We are so apt to associate air and motion it is not always easy to realise that air, like solids, can be subjected to inertia. A railway carriage, for instance, when in motion usually vibrates, and the action should have some effect on the air within it; but let the windows be closed for a few hours, and it will be found, especially in hot weather, that the air in a compartment is stifling. There are ways for the air to escape slowly from the carriage, and no doubt there is corresponding circulation, but it is not sufficiently expeditious to allow us to inhale what remains without inconvenience. In some churches oppression is also often endured by the congregation not only during services but on entering, although appliances for ventilation may be prominent objects on the roofs, and the cause is the insufficient head. The ventilators may be, like those mentioned above, stuffed with leaves or dirt and cannot act, or they may be of insufficient power. But to employ a head that would overcome such obstacles would be to create a new evil. It is one which was long familiar in the House of Commons, for as soon as the least complaint was expressed about oppression of the atmosphere, currents were let loose which made the members apprehensive of losing their papers. How to attain the mean between opposing forces in ventilating is no easy

matter, and calls for skill and experience on the part of specialists.

Mr. SHAW had hardly commenced his investigation before he discovered the need for an instrument that would indicate the quality of the air which fills a room. Many architects have also desired for a similar aid. An approximation towards the quantity of air which passes in a limited period can be obtained and the temperature can be tested readily. But more important to know is the degree of impurity. It is evident Mr. SHAW has made some progress towards devising an apparatus which could be used as a guide and would dispense with elaborate chemical tests, but it is not yet available for general use. We hope he will not allow the subject to drop, for the value of his investigations would be enhanced if they were followed by the production of a simple apparatus which could be used without the aid of an expert.

SOUTHWELL CATHEDRAL.

LAST week we published the appeal which John Carter made to posterity for the preservation of the screen in Southwell Minster, of which a view appeared in last week's *Architect*. He could not have anticipated that about seventy years afterwards the screen was to become the subject of a great battle between church dignitaries, restorers and others. The Bishop of Lincoln (Dr. Wordsworth) was anxious to see the building approach in its arrangements the other cathedrals. The choir, which was adapted for the use of a body of canons, would not serve for a great many clergy who might assemble on special occasions. But to increase the area of the choir it would be necessary to remove the screen. Bishop Wordsworth could not agree to that operation. He said :—"I am decidedly of opinion that it ought not to be removed, at least, till it is clearly proved that its retention is inconsistent with the convenient use of the church for purposes of Christian worship and instruction." As there was much difference of opinion on the subject Mr. Street was requested to consider the subject. As a result the following interesting report was produced, and it secured the safety of the screen and its retention in its original position :—

14 Cavendish Place : June 1, 1876.

My dear Lord Bishop,—I am ashamed to say that I have delayed giving you the advice you desire at my hands as to whether you may safely give your approval to Mr. Christian's scheme for the restoration of the choir of Southwell Minster, from day to day and week to week, because the more I thought of the case the greater seemed to me to be the difficulties in the way of doing anything, which would not only be conservative of all the architectural interest and beauty of the building, but at the same time thoroughly useful for the religious worship and teaching of the congregations for whose use and edification the building is to be restored and rearranged.

As I find that I cannot endorse Mr. Christian's scheme for the rearrangement of the interior as it stands on his plan, I must go at some length into my reasons for dissenting from it.

As in so many of our great churches, whatever difficulty occurs here arises from the use to which we wish to put the church not being at first sight precisely the same as that for which it was gradually adapted by its builders. And it is very necessary to see whether we cannot so far harmonise the old and new uses as to get over almost all apparent difficulties.

In its original foundation Southwell Minster was just such a church in its ground-plan as one would like to devise at the present day for such a place. Its choir, east of the central tower, being only about 55 feet in length, afforded no more than just the due space for the ministers of the church and the decent celebration of their functions, whilst even if it were prolonged westward across the transept (which it may perhaps have been) its length would only have been about 80 feet, and a choir placed at the intersection of the four arms of the cross would have been seen and heard better than anywhere else in the church by a large congregation.

These short choirs, so usual in the cathedral and conventual churches of the eleventh and twelfth centuries, were soon extended. The accommodation in the choir, which was so exactly what we can use well at the present day, was found in those days to be quite insufficient for the increasing numbers of the ecclesiastics connected with the church; and so in the thirteenth century an entire reconstruction on a very much enlarged scale of the whole eastern limb of the cross was undertaken.

At Southwell this enlargement was conceived in a most noble and artistic spirit, and the architectural result is beyond measure beautiful, few thirteenth-century choirs being more truly excellent in every way. Nor was it very extravagant in the space it gave to the choir. What this was will be seen by the diagrams appended to this letter, from which your lordship will see that the position of the altar could not have been removed more than about 12 or 15 feet nearer to the east than it was in the first position. The eastern bays of the north and south choir aisles were undoubtedly built for chapels with altars They were therefore not allowed to be passage-ways, as proposed by Mr. Christian, and were no doubt screened off at the ends and sides from the rest of the church. In the same way the three eastern bays of the central portion of late years thrown into the choir, and proposed to be again so used by Mr. Christian's plan, formed the lady chapel; and between these three eastern chapels and the choir one bay was left entirely free, so as to form a procession path round the choir, and to give access to the three eastern chapels already mentioned and to the two beautiful chapels opening as eastern transepts into the choir aisles. I hold as an archæologist that there can be little, if indeed any, doubt as to the general character of these arrangements. The only question not clear is as to the nature of the screens which at that time enclosed the choir on all sides, and divided the aisles from it and from the chapels. Probably, however, they were not very close, and did not shut off the choir completely from the nave, or it may be presumed that the close stone screen and loft erected at the entrance to the choir in the fourteenth century would not so soon have been substituted for them.

In the thirteenth century no less, therefore, than in the twelfth, the choir of Southwell Minster would have presented no difficulty whatever to our Anglican use. We should have been able to use the choir for the clergy, the nave and transepts for the laity, and the noble eastern chapel for those services, such as early communion offices, early matins, instructions for candidates for confirmation, or for young communicants, &c., in which a small congregation only is gathered before an altar, and where none of the adjuncts of a choral service are required.

The difficulties which now exist in the arrangement of the interior are entirely caused by the small addition to the church just mentioned, which was made in the fourteenth century, and which for all practical purposes has completely divided the church up to the present time into two distinct portions, of which one hitherto has been used only as a sort of narthex, and the other as a place of worship. This was the close stone screen and large rood-loft over it, with its row of highly ornamental stone canopies over the return stalls on its eastern side. This screen is about 15 feet in depth from east to west, is groined in three divisions, and has two staircases leading to the loft. This, which was originally intended for a rood-loft, is now found to be large enough to contain a considerable organ, which effectually completes the blockade between the nave and choir. The consequence of the retention of this screen has been naturally, as in so many other cases, a complete alteration of all the arrangements of the ground-plan to the east of it. And I hold that on architectural grounds the beauty of even the most exquisite screen would be dearly purchased by the consequent necessity of such alterations. In any real restoration of an ancient choir I always maintain that the first thing to be done at all costs is to restore the altar to the place which the original builders of the choir intended it to occupy. Any other arrangement out of deference to the builder of a screen added a hundred years later than the erection of the choir is no work of restoration in any true sense of the word, but appears to be rather a blind and unintelligent deference to alterations to which we have become accustomed.

The true course is first of all to restore the thirteenth-century arrangements of the fabric, then next to see whether a due and good use cannot be made of the building when so restored ; and lastly, if this due use is hindered or prevented by the subsequent erection of a piece of furniture (which is what the fourteenth-century screen is), then the only true course is to have the courage to remove the obstruction, preserving it carefully, on account of its architectural interest, but not allowing it to hamper or hinder the whole usefulness of the building.

The population of Southwell is not very great, and consequently I think it may be possible here to effect a compromise which in such cathedrals as those of Exeter and Ripon appears to be impossible. In the case of these two cathedrals the retention of the old rood-screens appears to involve either the enlargement eastward of the old choir, or, what is even more objectionable, the filling of the choir aisles with benches. It cannot be too strongly impressed on everyone that in such churches the choir aisles were distinctly passage-ways, and nothing else. To convert them to any other use is wholly to ignore their builders' intentions, and, in my judgment, wholly to ruin their effect. Keeping the principles which I have stated in view, let me now point out to your lordship what results they involve at Southwell, and how these results can be utilised satisfactorily, without prejudice to the performance of Divine service. Beginning from the east end, there will be the old lady chapel, a central chapel of three bays, and about 45 feet in length. This should be screened off from the rest of the church, and, fitted up properly, would be most useful for early Sunday or weekday celebrations of Holy Communion. Similar use is made of similar chapels at Hereford, Salisbury and other

cathedrals. The practical convenience would be very great in many ways. West of this chapel would be one bay of the choir, which would form the connecting passage between the north and south choir aisles to the east in the choir.

The choir would consist of four bays east of the tower and rood-screen, and would be somewhat less than 60 feet in length. It should be fitted just as it originally was, as far as this can be ascertained. The stall canopies at the west end are very exquisitely designed and wrought in stone, and have been copied with singular skill and accuracy by Bernasconi in the plaster stalls and canopies which he erected on either side of the choir. When he erected these canopies he no doubt removed the old wooden screens and stalls; and I was delighted to find lying in a heap of lumber in the roof of the chapter-house a number of fragments of these screens, of extreme value and interest, and enough in quantity to give the key to the character of the whole of the wooden fittings of the choir. I advise, therefore, that Bernasconi's stalls and canopies should be entirely removed, and that two rows of stalls should be fixed in the two western bays of the choir, leaving the two eastern bays free for the altar and its steps.

In the choir so arranged there would be room, it is true, for only a very moderate congregation; but there would be ample room for the sort of congregation which assembles commonly on week-days, when the stalls are more or less occupied by laity, and when a few additional seats can be provided, if necessary, by the use of chairs below the stalls.

The difficulty now arises as to how we are to provide for the larger congregations which on Sundays, and occasionally on other days, will gather in such a church.

Assuming that the rood-screen is to remain, it will be important to see whether this cannot be lightened in some degree. At present it appears to be a solid wall of division between the nave and the choir. But when I visited Southwell I had the floor of the loft taken up, in order that I might see if the old stairs remained, and there I found not only the two usual staircases but also openings in the wall at the back of the stalls, which, if they were repeated on the other (west) wall of the screen, would have a valuable effect in making the screen more transparent, and the service in choir more audible than it now is in the church. But at the best such openings would make but a slight improvement, and it would not, I fear, make it possible at any time to use the nave and choir together without some modification of ordinary usages.

The use of nave and choir together appears to me, however, as I have little doubt it will to your lordship, to be the one object which in any real restoration of such a church ought to be kept in view, and I think it may be accomplished by the application of a little common sense in the use we make of the existing features.

I have already explained that the rood-screen was introduced as an addition to the then existing fittings of the church in the fourteenth century. When it was built the people still used the nave, and it is pretty certain that its builders had no idea of making that use less easy. The probability is all the other way. The loft is a spacious erection, approached by two staircases, and with ample area on the top for a choir of singing men. When it was built the choir stalls had each their own occupant, much more regularly using his seat than we now imagine, and there was probably no provision of any sort for choir boys or for laity within the gates of the screen. I have no doubt that it was found to be desirable to give the people more rather than less opportunity of hearing the service, and that this loft, which now seems to be such a hindrance, was erected for this very purpose. It was, in short, the orchestra or singing gallery of the church, and I believe that it might again be restored to the same use with the best possible result. When it was built the organ was not the institution it now is. A small "pair of organs" may have been placed on the loft, and might again be restored to their position, so as to give the choir all that they can require for assistance in their musical services, whilst the great organ can easily be provided for elsewhere, either out of sight, as at Canterbury, or at the end of one of the transepts or of the nave, so as to be useful on great occasions for accompanying the unisonous singing of the nave congregations, and for other purposes, when great organ performances are required. With all the choir services sung from this central gallery or loft, the lessons read from an eagle under the central tower, and the sermons preached from a pulpit placed against one of the piers of the central tower, we should have the great satisfaction of seeing the whole church thoroughly usable in every part, in exact accordance with the intentions of the old builders, without alteration or removal of a single old feature, and with, I am certain, the happiest results from a religious as well as from an æsthetical point of view, and without any of those too fashionable alterations of the old uses and arrangements of the choir aisles and chapels which have been effected of late years in the cathedrals of Bristol, Ripon and Exeter, and which Mr. Christian's plan suggests for your approval at Southwell.

If, however, your lordship is not convinced by my statement, and is disposed to think that the restoration of the use of the rood-loft in the way suggested is not a scheme to which you could give your sanction, I must proceed to point out that there are two other courses open which would not involve an entire mutilation of the old choir arrangements (the retention of which ought to be a *sine qua non* in any work of restoration), though I much doubt whether you would like to be responsible for recommending either of them in preference to the course already suggested.

The first would be the absolute removal of the fourteenth-century rood-screen and loft from its present position. This screen not being in the way, there would of course be no difficulty whatever in using the whole church properly, and for myself I have the courage to say that *were I not distinctly of opinion that the screen may be utilised in the way I have suggested*, I should not object to being responsible for its removal and its re-erection in another part of the church (*e.g.* across the transept), keeping it as an architectural curiosity, and not allowing it to be a hindrance to Divine service. The violence done in this way to one feature in the church would to my mind be moderate indeed compared to that which is done to every portion of the choir arrangements when—as in the recently restored cathedrals already referred to—in order to save a disused rood-screen, the altar is moved back from its old place, the procession path round the choir is done away with, the stalls in the choir are added to, seats and chairs are introduced for the congregation between the stalls and the altar, and lastly, and perhaps worst of all, the aisles are opened to the choir and seated for the congregation; whilst as a consequence of all these changes a nave restored or built at vast expense is incapable of doing any, or at any rate proper, service, simply because wrong service is demanded of the choir and its aisles. Such an illustration of straining at a gnat and swallowing a camel never was exhibited as is by those who in their desire to be conservative about a rood-screen are so radically destructive about every other ritual arrangement in an old church. But at Southwell I think the necessity for this sort of display of courageous common sense and respect for real archæology does not exist, and I do not therefore recommend the removal of the old screen, though it is the second in order of the alternatives open. A third alternative would be to restore the choir exactly on its old lines, to keep the organ where it is, and to have the Sunday services held as they are now in the nave. But this implies the provision of an altar in the nave, with seats for the choir, and this would not only be very unsatisfactory in its effect upon the building, but might in many ways be liable to objection, and I mention it with no desire to recommend it. It seems to me to be the worst course of the three, but better than that which is shown on the plan proposed by Mr. Christian, according to which the choir is to be opened from end to end, the altar moved to where the lady chapel altar originally stood, the stalls increased in number, and the congregation seated (I suppose facing north and south) in the space between the stalls and the altar, and in the eastern transepts and choir aisles, or, to quote the words of Mr. Christian's report:—"As regards the new seating, I do not think it would be desirable to put fixed seats *beyond the line of the transeptal chapels*, but would advise that the whole of the remaining portion be fitted with chairs. By this means within the limits named as regards the choir, and by *making use of the whole of the aisles and eastern transepts*, good accommodation would be afforded for a congregation of about 700, which in ordinary times would be amply sufficient, and on extraordinary occasions the nave and transepts would be available." *

I regret that I am obliged to trouble your lordship at so much length with the reasons for the suggestions which I have had to make. It is necessary to do so, however, because the practical result is that I should ask you to put my suggestions into Mr. Christian's hands, with a request that he would see whether he could not bring himself to agree with me. I am sanguine enough to think, from his tone when we went over the church together, that he would do so. I know well that his most anxious desire is to leave this grand church, when he has refitted it, an example of a building restored in the best and most truly conservative way, both inside and out; and I feel sure that he will see that my proposals are wholly made with the object of assisting him in doing this. The other portions of Mr. Christian's proposals are generally, I think, such as your lordship may safely agree to. The restoration of the external roofs to their original pitch is a work as to the advantage of which there cannot be two opinions, and the restoration of the spires covered with lead on the western towers is much to be desired. As to the central tower, I agree with Mr. Christian in thinking it desirable not to alter the roof.

The restoration of the roof of the chapter-house is a most desirable work. This beautiful building would have its charms

* The italics are not Mr. Christian's. It will be observed that no explanation is given as to how the nave and transepts are to be made use of on extraordinary occasions.

much enhanced, and the room gained above the vault might well be fitted as a museum for the various curiosities discovered from time to time, and for the safe keeping of which some apartment is much required in such a church. As to the proposal to remove Bernasconi's tabernacle work I am agreed with Mr. Christian; but as when he made his report I think he was not aware of the existence of the fragments of old oak screens and stalls, he would probably modify his proposal to erect iron grilles. If my suggestions are adopted the aisles will not be wanted for congregational purposes, for which they were not built, and very open side screens will not be required. I agree entirely in Mr. Christian's proposals as to the arrangements for the vestries and library; but I venture to suggest the advantage of securing the old hall of the bishop's palace, and restoring it as a choir practising room or school—a room much wanted in connection with such a church.

In regard to the chapter-house, I would suggest, in addition to the work proposed by Mr. Christian, that the beautiful passage leading to it should be properly restored or repaired.

In the warming as now managed I think great improvements might be made. At present a chimney from each stove defaces and destroys the stonework in its neighbourhood. I should like to see the whole church heated from an apparatus and furnace placed entirely away from the Minster in part of the old palace to the south of the south transept. The fuel might then, as suggested by Mr. Christian, no longer deface any part of the church, and the damage by smoke would also be avoided. The annual cost of the fuel for and repairs of a number of Gurney's stoves is very considerable, and their unsightliness is equally great. If the altar is placed in its old position, as suggested by me, funds would no doubt be forthcoming from independent sources for making it, as well as the reredos, pulpit, and other fittings, worthy of the building in which they are to be placed.

The plans appended to this letter are (1) a plan showing the position of the altar in the twelfth-century church, and (2) a plan showing the arrangement of altars, screens and choir after the choir had been rebuilt in the thirteenth century. The subsequent alterations were the erection of very magnificent sedilia in the south wall of the lady chapel, and the erection of the rood-screen and loft at the west end of the choir. There is, I believe, no evidence whatever that the choir altar had been moved from the place shown on plan No. 2 before the Reformation.

I trust that I have said enough to show that if the case is not uattended with difficulties, there is, nevertheless, every possibility of making this noble church thoroughly useful at the present day without removal of any old features, and without departing in any degree from the old lines.—Believe me to be, my dear Lord Bishop, yours very sincerely,

(Signed) GEORGE EDMUND STREET.

KILDARE ARCHÆOLOGICAL SOCIETY.

THE annual excursion meeting of the Kildare Archæological Society took place on the 13th inst. to the Kilcullen district. Knockaulin Hill was first visited.

Lord Walter Fitzgerald described the hill as being 600 feet in height. In the Irish annals it was named Ailinn, meaning "rock," and its ancient name was Dun-Aulin, or the "fort of Aulin." In the Annals of the Four Masters there were several references to the place and to the numerous battles fought there from time to time. The earliest of the battles is placed at 1031 before the Christian era, and the second B.C. 111. The ramparts surrounding the whole are an Irish mile in circumference, and at the present time the bottom trench is wide enough for a coach-and-four to be driven round it. This "ring," as it is called, includes a space of about twenty Irish acres. It is excavated all the way round in the form of a fosse or ditch. The magnitude of the work may be imagined when, as was stated, the only tools those who dug it out had were mere wooden or stone hatchets. In 1798 it was used as an encampment by the rebels, and on the top is a smaller kind of rath, which, as one of the natives explained, had been excavated and used as a kitchen by the rebels. On the northern side of the hill is an ancient well called St. John's Well, to which, in ancient times, was attributed remarkable curative power. The son of the present tenant of the place, who uses the hill for grazing, told him that he himself had often seen garments and crutches which had been laid aside overhanging from the branches, they having been left there by people who had been up to the well and performed its circuit two or three times for the cure of rheumatism. Unfortunately the well, from neglect, has been almost obliterated, and it is now little more than a dung-heap. Another feature of interest on the hill is a huge boulder which lies on the trench. It is inscribed to Finn M'Coul, who is said to have thrown it from the Hill of Allan, nine miles away. The hill had stood just as it is to-day for 2,000 years. The absence of other antiquarian remains might cause disappointment, but it must be remembered that mortar was not used for building purposes till the introduction of Christianity.

The party proceeded to Old Kilcullen churchyard, a quarter of a mile away. This is remarkable chiefly for its round tower and sculptured cross shaft.

Sir Arthur Vicars, Ulster King-of-Arms, read a description from the Society's magazine, in which it was maintained that the original use of the ancient round towers was as places of refuge for the clergy, and as a place of safety for church property in the disturbed times. They were originally erected in the ninth century, that being the period when the Danes first commenced their depredations. These towers were closely related to the Italian round towers, which had been erected for precisely the same purpose two centuries before.

Lord William Fitzgerald explained that Kilcullen literally meant "The Church of the Holly," the holly tree being the chief tree grown on the hills in the vicinity at the time St. Patrick founded the church there. The records extended from the year 469 A.D. to 1781, in which year the Rev. Mervyn Archdall wrote that Old Kilcullen was a large town with seven gates (only one of which now remains, 10 feet high, with a handsome Roman arch). From the description of the church given by the Rev. M. Archdall, it appeared that it then contained a monument of Sir Rowland Eustace; but experts ascribed this to Sir Oliver, who was summoned to Parliament in 1374. The graveyard had been the scene of historic battles. In 1642 the Marquis of Ormonde, with 3,000 foot and 600 horse, marched from Naas to Kilcullen, and on May 24, 1798, the place was the scene of a fierce encounter between General Dundas's forces and the United Irishmen, the latter of whom succeeded in triumphing over the soldiers, and killed twenty-two of their number, including two officers. Although the Rev. M. Archdall had in his day spoken of the tower as being in a ruinous condition, and not likely to exist much longer, it was taken in hand some few years ago by the Board of Works, and made a national monument. Another object in the graveyard was a very fine sculptured Celtic cross, which had been looked after by the Board of Works.

After luncheon the party proceeded to New Abbey churchyard, which contains a fifteenth-century altar tomb of Sir Rowland Eustace, Lord Portchester. This was also described by Lord Walter Fitzgerald. According, he said, to the Annals of the Four Masters, the monastery that formerly existed there was the foundation of the Eustace family. No trace of this building, which used to be called New Abbey, now existed. The steeple fell in 1764. Sir Rowland, the son of the founder of the abbey, died in 1496. The memorial which they now considered was of Sir Rowland and his wife, and took the form of an altar tomb, which, though not intact, was still in existence.

The last visit of the day was paid to Castlemartin, 1½ miles distant. Sir Arthur Vicars said:—Castlemartin, as the name would imply, was at one time possessed by the Martin family, it having been in the year 1200 the baronial residence of Richard Fitzmartyn, Lord of Castlemartyn. The lands subsequently passed to the Eustace family, who had a castle there, of which, however, like the former one, nothing remained. In MacFirbis's "Annals of Ireland" there was a passing allusion to Castlemartin. The Eustace family fortified their estates in 1641. The castle of Castlemartin surrendered upon conditions, on March 3, to the Marquis of Ormonde and Lord Lisle. In the same year the Commissioners of Forfeited Estates first met at the place, but adjourned to Jigginstown, near Naas, where was concluded a cessation of hostilities between the Parliament and the Irish Roman Catholics. It was afterwards, in June 1647, taken and burned by the Parliamentarians under Colonel Michael Jones. At about the beginning of the last century Castlemartin came into the possession of the family of Mr. Harrison, a Dublin banker, who built the house, from which it passed by purchase about the middle of last century to Captain Henry Boyle Carter, Clerk of the Crown. From the Carter family it passed into the possession of the present owners. In the Rebellion of 1798, when the house was in the occupation of the Carters, it was converted into a barrack for the king's troops. With reference to the ruins of the curious little chapel at the back of the house; which formed the chief object of interest for them, the chapel was founded about the year 1200 by Richard Fitzmartyn, Lord of Castlemartyn, and was dependent on the church of Kilcullen. It was granted in 1212 to the Priory of Christ Church, Dublin, along with 7 acres of land. It was primarily built as a mortuary chapel for the Fitzmartyn family. The peculiar feature of the chapel was the steeple, composed of merely two parallel walls. Passing from the chapel through a doorway, and ascending some six or seven steps, you reached a narrow passage between the tower walls scarcely 3 feet wide, from which was a door opening into the chapel, and raised from the floor about 8 feet. Ascending four more steps was another doorway looking into the courtyard. The theory was that these two portals were in the nature of pulpits. From one the priest preached to the congregation within, and from the other to the congregation without. This

arrangement, they were told, constituted an unique instance of the kind in Ireland. In the adjoining burial-ground were portions of several monuments, including part of an altar monument representing in niches the heads of mutilated figures wearing the pointed Irish cap or bonnet, and also the effigy of a headless knight in armour, holding in his right hand a sword erect, and in the left hand a pair of scales with a figure on each scale. Lord Walter Fitzgerald suggested that this represented St. Michael the Archangel weighing souls, but from the absence of all ecclesiastical emblems on the monuments he was inclined to think that it had a warlike rather than a religious significance.

FOUNTAINS ABBEY.

SEVERAL members of the Yorkshire Archæological Society visited Fountains Abbey last week. On arriving at the ruins they found Mr. W. H. St. John Hope, who has carried out researches at the abbey from time to time, and added much to the general knowledge on the subject.

Fountains Abbey, as is well known, originated in a small body of Benedictine monks from St. Mary's Abbey, York, who desired to obey the rule of St. Benedict more strictly than it was practised there. Being compelled to leave their own abbey through the opposition of their brethren, they were received by Archbishop Thurstan, who bestowed upon them, in 1132, the site of the Abbey of Fountains. The first buildings were mere huts, but the advent of the Dean of York and of two of the canons, who joined the little community, enabled permanent structures in stone to be begun, probably in 1135. The buildings were laid out on the normal Cistercian plan, and it is not unlikely that they were begun under the direction of Geoffrey, a monk of Clairvaux, who came over to Fountains to teach the brethren the Cistercian rules. Mr. St. John Hope pointed out that the Cistercian order differed from other orders of monks in the division of its communities into monks, who were residents, for the choir services, and the gentlemen who were called in the statutes the "conversi," the working brothers, who were not bound to attend all the services, and who were responsible for the outdoor work on the farms, &c. In all the Cistercian abbeys, especially those founded in the twelfth century, the whole of the buildings were broken up into two great sections, one for the accommodation of each of those sets of men. This fact explained a good deal in the arrangement of the buildings which otherwise was not understandable. Another interesting fact about the church was that it was quite evident from existing remains that the whole of those early arrangements, or divisions, were entirely swept away at the beginning of the sixteenth century. It all belonged to a rather remarkable story that had still to be properly unravelled, and which pointed to the original division of the monastery that had been departed from. As a matter of fact, Mr. Hope said he had not been able to find any trace of the existence of those "conversi" after the date of the Black Death in 1349 in this country, though they still continued to exist abroad.

Luncheon was given in the lengthy building hitherto known as the cloisters, but which Mr. Hope designates the Fratri of the Conversi. Lord Ripon occupied the chair. Subsequently Colonel Brooke (president of the Society) proposed the health of Lord Ripon, and said that as an assembly of those interested in the preservation of ancient monuments, they were doubly indebted to his lordship for the reverential care which he bestowed upon the buildings. They would see marks of that care year by year. He believed Lord Ripon felt the responsibility that had been placed upon him, and every one of them would agree in saying that his lordship had risen to that responsibility, and had done all he could to preserve that which had descended to him.

Lord Ripon said they were right in thinking that he felt, as he thought any man must feel to whom the lot had fallen, a very great responsibility in respect to those buildings. To be entrusted with the care of such a monument as Fountains imposed a national duty, a duty which they owed to all who were interested in the history and antiquities of the country. He had endeavoured for many years to discharge that duty to the best of his ability, and it was always a great pleasure to him when there were gathered round him at Fountains those who were interested in buildings of that description. He had now been the happy possessor of Fountains Abbey for a long series of years, and when he was coming down there that morning he ventured to feel a little sceptical as to whether his friend Mr. Hope would be able to tell him anything he did not know about the abbey. But he found when he was listening to him that he was entirely wrong; Mr. Hope had told them many things, some of which were not known to him, some of which threw a very interesting and a very brilliant light upon points which had been difficult for him to understand in regard to the purpose of the structure. And yet he hoped that during the afternoon they might still receive further instruction from him in those matters. There was one result of the decennial visits of the Society to the abbey which for a time, though only for a time, troubled him. After each visit he carefully studied the plans laid before them and listened to the addresses that were given, and learned the names of the different parts of the building. Ten years elapsed; he had told all his friends that all those parts of the buildings were called "so and so." But every ten years they got a new name, and he was obliged to learn his lesson all over again. For an old man like him that was a very serious business, but he was always intensely desirous of following the lead of the Yorkshire Archæological Society. His lordship concluded by proposing "The Yorkshire Archæological Society."

Colonel Brooke responded, and said he had from time to time visited all kinds of monuments of the kind that existed in the county—they had strictly confined themselves to Yorkshire—and he ventured to say that he wished they could see the same care bestowed upon all the remains of the past that they saw at Fountains.

The tour of the abbey was then continued. Mr. Hope, addressing the party at the south-east side of the abbey on the monks' infirmary, referred to the remarks of Lord Ripon. He said that during the last ten years he had visited many monasteries and read a good deal, but he had not seen any reason to alter the description of the buildings at Fountains which he expounded to the Society ten years ago; on the contrary, everything had tended to confirm the views he then came to. Attention was called to the admirable work by which portions of the building had been erected over the river Skell by means of piers and arches. In the case of the infirmary the whole establishment had been built upon a raised platform carried by four parallel tunnels, through which the river runs. The works of Abbot John of York (1206-11), Abbot John of Kent (1220-47), Abbot John Darnton, (1479-94) and Marmaduke Huby (1494-1526) were dealt with, Mr. Hope's remarks being listened to with the closest attention throughout. It was five o'clock before the whole survey of the extensive ruins was completed. Cordial votes of thanks were passed to Mr. Hope for his lucid and instructive address.

THE BASILICA.

WHAT was the ancient heathen structure, the basilica, whose title has acquired a celebrity so far beyond its original intention? It is, as Chevalier Bunsen strikingly observes, the especial offspring and symbol of western civilisation—Greek in its origin, Roman in its progress, Christian in its ultimate development; the word is co-extensive with the range of the European family. In the earliest form under which we can catch any trace of it, it stands in the dim antiquity of the Homeric age, at the point where the first beginnings of Grecian civilisation melt away into the more primitive forms of Oriental society. It is the gateway of the royal palace in which the ancient kings, Agamemnon at Mycenæ, David at Jerusalem Pharaoh at Thebes or Memphis, sat to hear and to judge the complaints of their people, and of which the last trace was preserved at Athens in the King's Portico under the Pnyx, where the Archon king performed the last judicial functions of the last shadow of the old Athenian royalty. But it was amongst the Romans that it first assumed that precise form and meaning which have given it so lasting an importance. Judging from the great prominence of the basilicas as public buildings and from the more extended application of them in the imperial times to purposes of general business, the nearest parallel to them in modern cities would doubtless be found in the town hall or exchange. What, in fact, the rock-hewn semicircle of the Pnyx was at Athens—what the open platform of the Forum had been in the earlier days of Rome itself—that in the later times of the Commonweath was the basilica, the general place of popular resort and official transactions; but in accordance with the increased refinement of a more civilised age, protected from the midday sun and the occasional storm by walls and roof. Still, the original idea of a hall of justice which came with the name from Greece was never lost at Rome, and it was characteristic of the Eternal City that the predominant image which was impressed on its public buildings was not commercial, or religious, or even political, but judicial. A long hall divided by two rows of columns into a central avenue, with two side aisles, in one of which the male, in the other the female appellants to justice waited their turn; whilst the middle aisle was occupied by the chance crowd that assembled to hear the proceedings or for purposes of merchandise; a transverse avenue which crossed the others in the centre, and if used at all was occupied by the advocates and others engaged in the public business; the whole building closed by a long semicircular recess (the form, it is said, most convenient for hearing), in the centre of which sat the prætor or supreme judge, seen high above the heads of all on the elevated tribunal, which was deemed the indispensable symbol of the Roman judgment-seat.

NOTES AND COMMENTS.

ONE of the results of the spread of education is the emigration of the humbler classes of people from country places to London and provincial cities, which, if not supposed to be paved with gold, at least offer chances of a more comfortable life. The least acquaintance with the elements of sanitation is enough to make the young discontented with the cottages which satisfied their ancestors. More healthful dwellings with brick walls are not obtainable in most country districts unless at a cost which will not remunerate the investor. Professor ROGER SMITH proposes the erection of wooden cottages. "We are all," he says, "familiar with wooden railway stations, and now that the most serious drawback to the employment of wood as a building material—namely, its liability to burn—can be got over, it would surely be worth while to try whether the employment for the walls of a wooden framework such as the so-called iron buildings start with, covered outside with good weather-boarding and lathed and plastered inside, would not so far reduce the cost as to make cottage-building a less as hopeless investment than it now is. Such a wall is probably as warm as and drier than a one-brick wall, and with care the building would be fairly durable—*e.g.* the railway station buildings at Reading, which were pulled down this summer after standing ever since the Great Western Railway was begun, proved to be still in good condition." There can be no question that wooden cottages would be an immense improvement on many of those which are now to be found in villages. If they could not be erected by local carpenters at a cheap rate, Canadian, Norwegian and Swedish manufacturers would not object to supply them. But the by-laws of the Local Government Board do not authorise wooden habitations, and a trustee who would erect them would be likely to discover that he must become responsible for his benevolence. The Board deserves praise for endeavouring to raise the character of building, but there are places where such wooden dwellings as many an English gentleman must be satisfied with in the colonies could be erected with advantage.

ALTHOUGH surveying, registration and determining of boundaries are supposed to be perfect in England, it is satisfactory to learn that it is possible to find one spot at least which is as independent of control and taxing as any island in the Antarctic region. The Rev. W. L. HARRISON, vicar of Great Wollaston, has drawn the attention of the Local Government Board to the fact that there is in his parish a piece of land on which are two cottages not included in any poor law union and pay no rates. An inmate of one of the cottages wanted to go into the workhouse, but the question arose, What workhouse? The adjacent unions are Atcham and Forden, the former in England and the latter in Wales, and, according to the ordnance map, the land and cottages are on the English side of the boundary line. Mr. HARRISON has submitted to the Local Government Board that every piece of land must be in some union, and therefore that there must be some workhouse to which an inmate can be sent. According to the map the land is in the parish of Middletown, and according to another in Wollaston. Some years ago the cottages were rated in the latter parish, but in an action to recover the rates the overseers were nonsuited on the ground that the property is not in Wollaston parish. If there is one case of enviable freedom from taxation there may be several, but the people interested observe a prudent silence, and who can blame them?

BY 3 & 4 WILLIAM IV., c. 30, churches, district churches, chapels, meeting-houses or premises duly certified for the performance of religious worship are exempted from rates and cesses; but, with the exception of places of worship belonging to the Established Church, all others in the Metropolis are as liable to the payment of the expenses of paving new streets as ordinary houses. A few years ago the London County Council proposed to the Local Government Board that a similar exemption should be admitted in respect to charges for paving as is allowed for rates and cesses. There was a promise given by the Board to consider the subject whenever an opportunity occurred. The local government and taxation committee of the County Council have since asked the vestries and district boards of the Metropolis for their views on the subject. From the replies received it appears that they are practically unanimous in desiring that in this matter there should be uniformity of treatment. The committee, after carefully considering the subject, have arrived at the conclusion that there is no valid reason why Nonconformist places of worship should be liable for charges in respect of the paving of new streets from which the Established Church is exempt, especially as the position of London in this matter is unique as compared with the rest of the country. The lines upon which amendment is now sought are that buildings to be exempt should be required to be exclusively appropriated to public worship, as in the case of exemptions from rates for the relief of the poor, and that the deficit on account of the exemption of such buildings should be chargeable against the general rate of the parish or district concerned and not upon the owner of other property in the same street. Correspondence has again taken place with the Local Government Board in order to obtain the required amendment of the Metropolitan Management Acts.

CROYLAND ABBEY is one of those buildings whose survival is a wonder. In 1091 a large part was destroyed by fire. In 1114 it was shaken by an earthquake. In 1255 part was blown down in a storm. Forty years ago the abbey was supposed to be collapsing. The risks are not at an end, for on Wednesday in last week the rector says, "The whole north wall of the eastern chapel moved half an inch to the north, and must be speedily taken down and rebuilt from the foundations, as in the case of the two bays next the tower." The site would not be considered as well chosen by a modern architect, for it is peat and has gained any stability it may have by the aid of oak piling, which was put down in the tenth century. But the risks were accepted by the founders of the abbey on account of the interest which belonged to the place. Since the Rev. Mr. LE BŒUF became rector much has been done to secure the abbey. Among his latest works are the rebuilding of the two bays next the tower, one entirely so; the north wall of the north aisle or present parish church was underpinned on the outside face; a cross wall between two chapels rebuilt, and the east window in the tower repaired and cemented. The disaster of last week will need an outlay of 1,100*l.* Nor can it be said the expenditure of that sum will secure the old abbey for ever. The rector says the foundations are perfectly rotten, and how the building has held together for so many centuries is truly a mystery; one relieving arch was embedded only about one inch, having a projection of six inches. The question at present is to obtain 1,100*l.*, and the rector prays that the lovers of ancient monuments will help him by a generous response to his appeal for aid.

"A POCKET Dictionary of Hygiene," by Mr. C. T. KINGZETT, F.I.C., and D. HOMFRAY, B.Sc., is the latest addition to the collection of portable advisers. It is not everybody who can immediately recall what is the A B C Process, or the Government rules about ashpits, mortuaries, &c., or recite the various Acts relating to sanitation. In the new dictionary all such information can be found, with much else relating to hygiene, and in a form that is not larger than an ordinary ladies' card-case. We may expect before long that a technical library can be carried in the pocket without being obtrusive or spoiling the appearance of a coat.

ILLUSTRATIONS.

CATHEDRAL SERIES.—SOUTHWELL: CHOIR.

DRAWING-ROOM, THURSTONVILLE, BECKENHAM.

LAST week we published an exterior view of the front of this house in Stone Park, and this week we give views in the drawing-room, which is at the back of the house.

The builders were Messrs. SYME & DUNCAN, of Beckenham, who executed all the joinery and chimneypieces, and also erected the adjoining house, from the designs of the same architect.

WEST CALDER CO-OPERATIVE SOCIETY, LIMITED. NEW BUSINESS PREMISES, WEST CALDER, N.B.

LONDON AND WESTMINSTER BANK, STRAND.

VENTILATION AND WARMING.*

Introductory.

IT may be premised that in order to ventilate a room there must be provided (1) openings by which air may enter, (2) openings by which air may pass out, (3) a "head" or motive power which shall cause the air to enter the inlet openings and pass out of the outlet openings. The adequacy of the supply of air for the purposes of ventilation depends upon the provision and the due proportions of these three requisites. Each one of the three must be duly provided or the ventilation must necessarily fail. These I will therefore call the primary requisites of ventilation. For the adequate supply of air it is not indeed necessary that openings intended to be inlets should always be used for that purpose alone, a sufficient number of openings, any of which may function as inlets or outlets according to the circumstances of the moment, will satisfy the primary conditions of ventilation, provided there is "head" or motive power enough to drive a sufficient quantity of air through the openings.

There are other conditions which should not be overlooked if the ventilation aims at being called successful, viz. (4) the quality of the air supplied as regards freshness, cleanliness and temperature; (5) the distribution of the air in its passage through the room, having regard to its mixing with the vitiated air without causing draughts. These I will call the secondary conditions of ventilation.

In applying the terms primary and secondary to these requisites or conditions, I do not wish to express an opinion as to their relative importance or value in any particular case. If any one of the three primary conditions be not complied with, *i.e.* if there be no inlets or no outlets or no head, ventilation does not exist; if all three primary conditions be fully satisfied and either of the two secondary conditions be not complied with, there will indeed be ventilation adequate in quantity, but of such a kind that it might in some cases be regarded as producing a worse state of things than no ventilation at all.

I may be allowed, for the sake of making the matter clear, to interpolate one or two remarks upon the correlation of the head with the openings through which the air passes. The head or motive power for any opening may always be regarded as equivalent to a difference of air-pressure between the two sides of the opening, and may accordingly be expressed in terms of the height of a corresponding column of air or its equivalent in difference of water-level, or as a number of pounds-weight per square foot of area; these three modes of expression are easily convertible. The agencies available to provide this head may be briefly summarised as (1) wind impinging upon the opening; (2) wind blowing across the mouth of the opening; (3) hot-air or gases in a chimney or flue in communication with the opening; (4) mechanically-driven fans or blowing machines placed in the opening itself or in some duct or flue communicating with it. In my article on ventilation in Stevenson and Murphy's "Treatise on Hygiene," vol. i., I have explained that if the head or motive-power for any opening be represented as h feet of air (approximately equivalent to a pressure difference of $\cdot 015 \times h$ inches of water), and if the number of cubic feet of air passing through the opening per second in consequence of this head be V, then the ratio h/V^2 is approximately constant, that is, it depends only upon the size and character of the opening; it is numerically equal to $1/27a^2$ where a depends upon the dimensions and shape of the opening, and if the opening be a perforation in a thin plate it represents simply the area of the opening in square feet. If the opening be not a perforation in a thin plate, a can be computed by a more or less elaborate calculation from the particulars and measurements of the inlet or outlet as the case may be.

In the same article I have given a table from which the numerical value of the head derivable from the various agencies mentioned above can be computed.

If it were intended to provide for any room a system of ventilation which should be under complete control, and which should be independent of the casual opening of doors and windows, it would be desirable to provide each opening intended for the purposes of ventilation with its appropriate motive power. This would imply the provision of means for driving air through the inlets, which should be separately adjustable, and, in that sense, independent of the means provided for driving the air through the outlets. The arrangements could then be adjusted so that there should be no difference of pressure maintained between the interior of the room and the outside air, or any other room adjacent. I know of no case in which such an arrangement has been carried out in practice. The plans practically adopted are either to drive air, or, in the case of ventilation by wind, to allow air to be driven through inlets, and let it find its way through the outlets, or to drive air through outlets (as in the case of ventilation by a chimney) and let it find its way through the inlets. In both these cases a "secondary" head is produced represented by a difference of pressure between the interior and exterior of the room: in the first case the pressure in the interior exceeds that outside the room; in the second the reverse is the case.

* From the report by Professor W. Napier Shaw, M.A., F.R.S., on the ventilation and warming in certain of the Metropolitan Poor Law schools.

SECTION I.—GENERAL ACCOUNT OF THE INSPECTION.

Methods of Ventilation and Appliances Found in Use.

Except in infirmaries and nurseries where fires were kept burning the ventilation, as I have found it, has depended almost exclusively upon the wind for its head or motive power. There are many fireplaces the chimneys of which furnish a head for ventilation when the fire is burning, but in dormitories, where the ventilation is of highest importance, the fires are lighted only for very short times in comparison with the total duration of occupation throughout the year, and I have found no instance of really systematic ventilation by open fires.

In nearly all rooms it is usual to rely for ventilation upon open windows upon opposite sides of the rooms. Air-bricks near the floor or near the ceiling leading directly to the outside air, Tobin tubes or Sherrington valves on either side are sometimes to be found in addition. These may be regarded, so far as the primary conditions of ventilation are concerned, as additions or substitutes for the window openings, and, quantitatively speaking, their importance may be estimated as follows:—A 9-inch by 6-inch cast-iron air-brick in an outside wall with a hit-and-miss ventilator opposite to it on the inside wall is (on the principles laid down in sections 16-19 of the article referred to), roughly equivalent to an opening of 18 square inches in a window, and therefore may be looked upon as a substitute for opening a 3-feet wide window by half an inch; and similarly a 9-inch by 3-inch Tobin tube (without cover) supplied by a 9-inch by 6-inch air-brick, taking the avilable area of the latter as one-half of the nominal area, is roughly equivalent to an opening of 21 square inches, and may be looked upon as a substitute for opening a 3-feet window by slightly more than half an inch. In so far, therefore, as the ventilation can be regarded as systematised, the system generally aimed at may be said to be that of cross ventilation between windows or other openings on opposite sides of the rooms.

I have found a number of examples of the use of the motive power of the wind to produce a current by its passage across the mouth of a shaft in the case of (1) chimneys without fire, (2) special flues in the chimneystacks in communication with a number of flues in the walls for extract ventilation, (3) louvred openings communicating with the space between ceiling and roof, and (4) extraction cowls of various forms which communicate either directly with the roof space above ceilings or by means of shafts with the rooms below.

All these various contrivances may be classed as examples of natural cold air ventilation, and as they depend for their motive power upon the wind, which is notoriously capricious, the direction and amount of motion of the air through them is likewise capricious, and each opening must be regarded as a possible inlet or a possible outlet, according to circumstances.

Besides the wind, the other usual ventilating agent is the open fire. This is primarily used for warming, but incidentally it acts as an effective outlet ventilator. A full-sized chimney with a good fire may remove 20,000 cubic feet of air per hour if sufficient inlets for fresh air are provided. As the fires are most active in this respect in the coldest weather, an open fire is apt to cause cold draughts of air down other chimneys in the same room or an adjoining room if they have no fires or through-ventilation openings, and this effect sometimes leads to the stopping up of such openings.

The fact that ordinary open-fire warming implies cold-air ventilation causes serious difficulty in places where it is of the first importance that the distribution of air and warmth should be moderately uniform. The open fires have been in some instances replaced by or supplemented by closed stoves connected with the chimneys by long sheet-iron flues. These act practically as warming agents only, and are not wholesome unless adequate ventilation is otherwise provided. Their efficiency as ventilators is negligible. With the open fires are sometimes associated supplies of warmed air by means of Galton grates or some other grate constructed on a similar principle.

Besides the grates supplied with fresh air I have only found three attempts at warming the air introduced into the rooms—one is at Sutton, where some steam-heated radiators newly introduced into the junior boys' day-room have a fresh-air supply; the second is in the Hanwell Schools, where openings are made in the walls behind hot-water radiators; the third is in the boys' schoolroom and classroom and in the probation block at Ashford. The first is a very unsatisfactory mode of introducing warm air, as the radiator easily gets fouled with dust. I could see no means of cleaning it properly. The second is not open to objection, but the air-supply is on a small

scale, and was not regarded at the school as being of any importance. Those in the probation block at Ashford stood on cast-iron boxes that were provided with openings for cleaning, but they had become very much fouled with dust; the supply of air through them would be only very small on account of the want of motive power. In some other schools hot water or steam pipes passed in front of openings for floor-ventilation, but apparently there was no specific design in the relative positions. The existing openings had been disregarded in introducing the pipes, and have been in too many instances rendered inaccessible for cleaning.

Open fires are generally used for warming the school buildings, but steam heating or hot-water heating has been introduced into parts of some of them, and the officers in charge generally regard the changes as improvements. Such arrangements require more discretion in their use than is generally to be found in practice. As an open fire automatically secures a certain amount of ventilation, and its fierceness is an automatic regulator, with steam or hot-water pipes the ventilation must be otherwise provided. Moreover, the temperature of the pipes and coils is apt to be governed by such accidents as the state of the boiler fire or the demands of other departments upon the steam supply, instead of by the external temperature for the time being. The result is that rooms are sometimes overheated and sometimes not heated enough, and the temperature, instead of being more equable, may show wider extremes than with older methods. The judicious use of steam or hot water for warming, combined with ventilation, requires more intelligent control of the apparatus and more instructed care for such considerations as temperature and freshness than is usually to be found associated with the working of the apparatus.

In replacing open fires by hot-water pipes or steam pipes it is usual to press the economy of space too far. The pipes require a proper allowance of room in order that the radiation from them may not be interrupted, and also in order that they may be regularly and frequently cleaned. To run steam pipes round a room and cover them over with a bench about a foot high, or to bury them in a trench and cover them with perforated ironwork which forms a frequented gangway, is very economical of space, but it has attendant disadvantages. We have become accustomed to arrangements for heating which are completely concealed from view in churches and other public buildings. They have their disadvantages even there, but they are not so mischievous as in buildings which are very frequently or continuously occupied and where the dirt that accumulates is sometimes worse than ordinary dust. It is better to concentrate the heating in a number of properly distributed radiators and allow them reasonable space, whether they be placed near the walls or stand out in the rooms. The intervening connecting pipes may be under the floor if necessary, but in that case they should not be expected to contribute in any important degree to the warming of the room, and they should be fully protected against the accumulation of dirt.

This is a matter which requires attention in those schools where steam pipes, &c., are carried along corridors under the floors. It is an advantage to have the corridors warmed, but the nature of the warmed air requires close scrutiny, for the corridors often supply air to rooms opening out of them.

When steam or hot-water heating is introduced it is very undesirable to close the chimneys of the fireplaces which are not intended to be used any longer for heating purposes. Chimneys are excellent ventilators, and by drawing air from very near the floor they promote a local circulation of air in the room which is most valuable.

Probable Overheating of Dormitories and Schoolrooms in Summer.

A conspicuous feature of the arrangements in the school buildings is the very large proportion of window area to wall space. This disposition must generally expose the rooms not only to the cold of winter, but also to the action of the sun in summer. Without some specific observation I should not like to hazard any formal opinion upon the result of this exposure in nights following hot summer days, but I cannot think that the dormitories would keep reasonably cool unless there were an unusual amount of wind. It would be desirable to obtain some readings of temperature in the course of the summer in order that definite information might be available for the guidance of the authorities in this matter. A maximum and minimum thermometer would be useful for the purpose. I have not noticed any provisions outside the windows for reducing the heating effect of the sun. In some cases there are blinds inside, but these are ineffective in reducing the temperature of the rooms.

Air Analyses and Temperature Charts.

On the whole, during my visits of inspection, I found few cases in which the occupied rooms struck me as being offensively ill-ventilated. There was generally a good deal of open window, and not infrequently there were air-currents that would certainly be called draughts by any person whose customary occupation is sedentary. The rooms seemed to me to be, generally speaking, cold. The mode of ventilation and warming might, I think, fairly be described as in itself draughty and cold in winter, but wholesome, unless the extremes of temperature in summer and winter, to which the children must I think be exposed, have the effect of reducing their vitality. One serious defect was the absence of any provision for cleaning the air-ducts, some of which had been so long in use without attention that they had become choked with paint or dust. The dust of the dormitories being very large in quantity, and composed to a considerable extent of blanket fluff, rapidly accumulates, and not less in those ducts that are intended as inlets than elsewhere.

As regards the freshness of the air, it would of course have been of some advantage to my inquiry if the air of each occupied room could have been analysed for carbonic acid at the time of inspection. To have done so would have very much prolonged the visits, and the variation of conditions of wind, weather and temperature from day to day make it clear that a single observation upon a room would only have been of real advantage in few cases. The rooms which are occupied for the longest time, and the ventilation of which is therefore the most important, are the dormitories. In order to obtain some information to guide us in considering the efficacy of the arrangements for dormitories, certain dormitories at Sutton were selected, after the first inspection, as typical, and visits were paid on five successive mornings (March 30 to April 3) at the time of getting up (5.30 A.M.). Specimens of the air were taken from each of the selected dormitories and tested.

The desirability of obtaining some continuous record of the state of the air in rooms under inspection led me to consider whether some at least of the desired information could be obtained by means of a self-recording thermometer. The connection between the temperature record and the ventilation is as follows:—A well-filled dormitory (with the allowance of 300 cubic feet of air per bed) without any ventilation and without allowing for any loss of heat by conduction would have the temperature of the air raised through about 50 deg. Fahr. in an hour by the heat resulting from respiration (supposing that the occupants could go on breathing under such conditions), whereas the air of the same dormitory, if normally ventilated with 3,000 cubic feet per inmate per hour, again making no allowance for loss of heat through walls and windows, would have the temperature of the air raised only 5 deg. Fahr., and further occupation would not increase the rise. Allowing that half of the heat is lost by conduction it follows that when there is a little variation of temperature in the external air during the night the temperature of the well-ventilated room will differ scarcely at all from that of the external air, and the difference will not increase with the continued occupation of the room.

To put this matter to the test I placed in various rooms of nearly all the schools self-recording thermometers of a pattern known as Draper's, and have examined the records. The relation between temperature and freshness indicated above is satisfactorily borne out by the records. In rooms under conditions where ventilation may certainly be regarded as efficient the record shows that the room-temperature follows the external temperature quite closely. In other cases the temperature gradually rises during the night and drops suddenly when the windows are opened in the morning.

In examining the ventilation of the schools or similar buildings it is inevitable that one should feel the urgent want of some means of obtaining automatic records of the state of the air in the rooms as regards freshness. The badness of the atmosphere is often inappreciable by those who are breathing it, and it is only apparent to the senses of those who come into the room from the fresh air. On the other hand, an estimate of the temperature is easily formed by the occupants of the room, and a thermometer is easily appealed to to confirm an impression. We have no corresponding detector of the impurity of the atmosphere. Until some handy and automatic contrivance is devised for registering the state of the air as regards impurity, ventilation, with proper regard to temperature, will always require careful, tedious and troublesome attention on the part of those in charge of a building. Even where by mechanical ventilation a fan is supplying an appropriate amount of air, the need for some index of the state of the air as regards impurity is still urgent. I had hoped in the course of this investigation to make use of some apparatus which should at least dispense with the presence of a skilled observer or the transport of bulky vessels containing samples of air, but I have not yet succeeded in putting the apparatus to the test of practice.

(*To be continued.*)

Lord Egerton of Tatton will lay the foundation-stone of St. David's new Welsh church in Lime Grove, Oxford Street, Manchester, on October 3.

ROMAN REMAINS AT BOX.

I SPENT an interesting hour (writes a representative of the *Bath Herald*) at Box on Thursday inspecting the latest discovery of remains within a sufficiently easy distance of Bath to offer many points of connection with the evidences of the occupation, not only of that city but of the whole locality, by the Romans in the early centuries of the Christian era. It has been often pointed out that not only is the security of the Latin settlement of Aquæ Sulis attested by the grandeur of the buildings which were reared in these valleys, but still more by the traces of agricultural pursuits which were followed in the adjacent districts. It is very remarkable that in almost every direction round Bath have been found remains of Roman villas, as they are called, which were really homesteads, where for the greater protection lived together communities inside one protective wall. Abundant traces of one of these villas have been unearthed within the last twelve months by Mr. John Hardy, a respected resident of Box, on land in his possession adjoining the vicarage and under the shadow of the village church, which as likely as not was built at least in part of stone from the ruins of the villa now discovered. Speaking subject to correction I believe no such extensive remains of one of these villas has been found in this neighbourhood as that Mr. Hardy has the undivided credit of unearthing, and while he is hampered in his further investigation by such a prosaic obstruction as the boundaries of his property he has been sufficiently successful to enable him to make a rough ground plan, only slightly conjectural, of the Roman villa hidden when he acquired the property with several feet of fruitful soil bearing prolific fruit trees and potato plants. The villa, for reasons already explained, must have extended over a far greater area than Mr. Hardy's land represents, and it was traces of Roman occupation on the surrounding lands that led the owner, who is obviously an ardent if amateur antiquarian, to make promiscuous "trial borings." He had little reason indeed to fear disappointment, for just the other side of his eastern boundary wall in the vicarage garden when the foundations of a pigstye were being excavated, a tesselated pavement was unearthed, while on another side what was believed to be a bath was discovered with a tesselated pavement for a bottom, and on yet a third is at this present time preserved under cover in the grounds of The Wilderness another small piece of similar pavement. Furthermore, the "lay" of the land hereabouts encouraged Mr. Hardy in his investigations. There is not, it is boasted, a flat piece of land in all Box. Even the necessary 22 yards of level for a cricket pitch had to be manufactured. The one exception to the unevenness of the surface of the earth is the extensive plot on which stand the church, the vicarage, the gaunt building which once served for a workhouse, that attractive residence The Wilderness and the land belonging to Mr. Hardy. He inclines strongly to the belief that this solitary piece of flat country is the work of men's hands, and not natural, and the fact that at the back of the houses, standing by the side of the main road, there is a precipitate descent which it requires the provision of steps to accomplish, supports the theory strongly. There is slightly corroborative evidence that the site was excavated, too, in the fact that the building Mr. Hardy has been enabled to trace had its main entrance not facing the church, but the charming valley and hills on the other side, through which the railway now runs in places at a depth of 300 feet. If this were so there must have been a Roman roadway between the site of the discoveries and the river, traces of an ancient footbridge over which, it is just worth noting, have been found.

Mr. Hardy, who has been spending his odd time prospecting quietly during the last twelve months, soon found plenty to encourage him in his investigations, for the soil positively reeks with Roman remains. One of the earliest promises of hidden treasure lay in a number of oyster shells which came to light. The taste of the Roman for the dainty bivalve is an accepted fact, and the antiquarian will tell you there is no surer sign of the presence of the great race than the remains of oyster shells; in the excavations at Bath they abounded, and there is a pile of them in the museum. The foundation of a wall soon came to light, and the excavator made it his chief task to follow up its course and also those of the cross walls which occurred at regular intervals. He has effected this so successfully as to be able, as already stated, to present a ground plan of the land, which leaves little to the imagination. The main walls (or at least the foundations, for only here and there is there any of the actual wall remaining) which enclosed the whole villa were more substantial than the rest, being 4 feet in thickness—at least, assuming those on the south and west sides, which cannot be on Mr. Hardy's plot, to be identical with those on the north and east, parts of which he has uncovered. The block must have been oblong, and it is the north-east corner which has been discovered. The wall facing north is the longer one, and it is quite impossible to say what its extent may be, for it runs off into other property. It reappears in the gardens of The Wilderness, and probably the estimate that the villa had a frontage of 400 feet is more than a moderate one. The depth of the enclosed residence for similar reasons Mr. Hardy is unable to judge of, but it probably extended over the ground now occupied by the church and back to the precipitate descent near the present main road, previously spoken of. At the north-east corner Mr. Hardy has found what is supposed to be the foundations of one of the chief entrances. It is much in ruins, but obviously once was a noble flight of stairs. Just round the corner, so to speak, on the east side, is a very curious variation. There is the main 4-feet wall spoken of, and then an inch or so away, but quite distinct, another 3 feet in thickness, and beyond that still a third wall of even lesser bulk. It is difficult to explain these walls in such proximity to each other, but Mr. Hardy, who has an ingenious theory for most things he has found, is not lost here. He thinks the supplemental walls were for ornamental purposes, and supported a row of columns so essential to Roman architecture, which were surmounted with a stone carved frieze. The discovery of what was undoubtedly a portion of such entablature certainly lends weight to the theory. The carving is in a wonderful state of preservation, and a child could tell that it represented when intact the figure of a man. The portion found represented the trunk of a man and extends to the knees. The dress of the figure can be followed even to the cloak which denoted the freedom of the citizen; in fact the carving is perfect. The discovery of further portions of the frieze or of the columns would dispel doubts, but there is not much hope of this, because near by, and comparatively near the surface, excavations have disclosed a mound of mason's chips, and as these are hardly likely to have been left by the erectors of the villa near their front door it is assumed that it was here more modern masons found and reworked stone used, perhaps, for the church built 400 years ago, or for some other erection.

Immediately inside this main north wall has been found a series of rooms, easily definable because of the cross walls. There is evidence of at least five of these on Mr. Hardy's plot, and two are hypocausts—that is to say, the floors are raised for the purpose of heating underneath. The pillars which sustained the floors are all in excellent condition, but the floors themselves have disappeared, although the little squares of which they would be formed are scattered about in hundreds. Between the two hypocausts is a tesselated pavement with a geometrical design, which was the floor of another chamber, and parallel with these rooms (all divided, be it remembered by walls, the foundations of which can be traced) has been discovered a patch of undecorated Roman cement in perfect condition, which probably sufficed for the flooring of a scullery or kitchen, as a drain or culvert has been found thereabouts. At another point also parallel is another piece of pavement, this time without design and so narrow as to suggest a passage as its only purpose. Running behind this suite of apartments is what Mr. Hardy believes to be a large hall, or at least a large apartment, oblong in design. He has found two corners and therefore is able to say the hall, if it be such, was 25 feet in breadth. The extent of his property unfortunately is less than the length of the hall, but Mr. Hardy assumes it would be at least 76 feet. Practically everywhere between the walls of this large apartment the spade discloses at a depth of a few feet a floor of tesselated pavement, the complete design of which, if it could be uncovered and found in as good order as some of it is, would constitute one of the best pieces of Roman pavement in England. The pattern is of regular geometrical design, as indeed are all the pavements with which the place teems, and far too intricate to attempt to describe. It is all worked in ½-inch blocks of material of three kinds—blue lias, red brick and white stone—except the border, which is in inch blocks and entirely white. The fact that the same design crops up in three distinct places, with the absence of cross walls, makes certain the suggestion of one large hall. This is as far as Mr. Hardy's explorations can carry him in determining the architecture of the building, but it has to be remembered that in every direction except on the north the walls pass out beyond his boundaries, and therefore beyond his reach. The existence of Roman remains on the surrounding property has already been spoken of, and it may be added in leaving this branch of the subject that Mr. Hardy holds firmly the opinion that a large pond of a strangely artificial looking shape just beyond his southern boundary—a relic of an old mill which once stood there—is nothing less than three or four Roman rooms filled with water and with tesselated pavement for a bed.

The whole of the ground Mr. Hardy possesses is as prolific in Roman odds and ends as the soil above is in its yield of potatoes, fruit and weeds. Space prevents reference to a tenth portion of the various proofs of the existence of a Roman dwelling-house the earth yields to the spade's touch. The interior walls of Roman houses were of stucco, and not only do large lumps of this abound, but on one side of the broken material may be seen the crude painting, representing towers,

human faces, &c., which did duty in the place of the wall-paper of the present day. The roofs were made in one solid mass by the slackening of lime, and large pieces of this material, which is light and must have served the purpose splendidly, are turned up everywhere. There was an outer covering of tiles, which are also to be found, and they, mirabile dictu, exactly resemble in shape a tile which has just lately come into popular use in this country. Drain pipes, many and varied pieces of pottery, polished and otherwise, a boar's tusk, the stone core of a pedestal, an altar, and unfamiliar bones, are only a selection of the things unearthed, all of which Mr. Hardy carefully preserves. Most wonderful of all, perhaps, is the discovery of a Roman flue, which consisted of two tiles made to fit together by flanges into an oblong shape, allowing a passage for air of about 1 inch by 10.

From this incomplete description many will doubtless be anxious to see for themselves the remarkable discovery Mr. Hardy has made, and I may say that the key of the property is always available either at Mr. Hardy's establishment or at the Bear Hotel. Proof of the importance felt in the discovery is afforded by the fact that the Bath Natural History and Antiquarian Field Club have arranged to view the remains at an early date. Sir Charles Hobhouse and the Rev. H. H. Winwood are among those who have already been over the ground.

THE MANOR OF REIGATE.*

THE parish of Leigh is not mentioned in Domesday Book, and was probably at that time part of the manor of Cherchefelle or Reigate. If the visitor seeks a by-road, retired old English village, he will find Leigh a miniature example of one. In well-wooded undulating country, shut out from the bustle of high road or rail, here is the village green with its well, the church and school, the moated manor-house and the inn, the rural shop and post office, a farmyard and some old cottages. Here have been few innovations and few changes except those incidental to the passing away of generations.

Mr. Salmon would seem to have visited Leigh in winter, his comment in his "History of Surrey" being, "At this place begins one of the dirtiest counties in England." Since 1731, however, the lost art of road-making has been recovered, and at present, instead of the mud calling for remark, we may rather observe that the roads in the county are, as a rule, exceedingly good.

The manor of Shelwood includes a considerable part of the parish. In 1156 Henry II. gave to the Prior of Merton, in frank-almoigne, Selewode and Kingswode. The tenants of the manor seem to have found the yoke heavy, and an inquest was held in the reign of Henry III., when the jury disallowed the right of the lord to compel the tenants to reap his harvest for him, but "found that they must pay Peter pence, and also that they must not marry a son or daughter out of the manor without license of the prior."

In 1654 Sir T. Brown, of Betchworth Castle, was owner, and from his son it came to Thomas Jordan, of Gatwick, and in 1806 was sold to the Duke of Norfolk. The site of the old manor-house is now occupied by Shelwood farmhouse, about a mile south-west of Leigh village. Elizabethan coins and other relics have been found here.

Leigh Place, just north of the village, is an ancient mansion. It has been slightly modernised; the moat is perfect. In Manning and Bray's "Surrey" is a view of Leigh Place, in which the drawbridge is shown as then existing. The plate was presented by Rd. Caffyn Dendy, the then owner, who had the following in a small frame put up in the house:—"The first inhabitants of this place which I can trace were the great family of Brewse, or Brewose, who followed the fortunes of the Conqueror from Normandy in 1066. They were possessed of many lordships in Surrey, and of forty-two manors in Sussex. John de Brewse having escaped from the tyrant, King John, who starved two of his brothers to death in Windsor Castle, married a daughter of Llewelyn, Prince of Wales, and died in 1232. Lord William, his son, was of Findon, in Sussex. Sir Peter de Brewse, third son of this William, had a younger son, Sir John, who resided here. The next who succeeded was Sir George, his son, who died 1419; he possessed the manors of Imworth, Walton and Bookham in Surrey, and Crawley, Sedgewick and Nuthurst in Sussex in 1432, whose son John was esquire of the body to Henry VII., a great favourite, and succeeded to many of the manors of the Brewses, 1500. Thomas, Earl of Surrey, next came to the estate in the paternal line of the Brewses."

The next family in possession of Leigh Place, so far as can be traced, was that of Arderne, in the fifteenth century, but it does not appear in what manner they acquired it. There would appear to have been some connection between the families of Arderne and Dudley. John Dudley, who afterwards became Duke of Northumberland, is said to have lived at Leigh Place, and there is a tradition that his daughter-in-law, Lady Jane Grey, occasionally stayed at the house, but this cannot be true if her visits there were to Dudley, as she was not born when he sold it. Dudley sold the estate to Edward Shelley, of Fyndon. This Edward Shelley was the second son of John Shelley, of Michel Grove, in Sussex, and ancestor of the poet Shelley and of the Lords De L'Isle, of Penshurst.

At Swain's Farm, about a mile east of the village, Ben Jonson, the poet, is said to have resided, and a room in the old-fashioned building was called the study. Stumblehole, another estate near Swain's, was held of the king, and paid castle-guard to Rochester Castle. The church (St. Bartholomew) is in the Perpendicular style and consists of nave and chancel, with a stone tower; it has been considerably enlarged. In the church are several brasses and indents of the Arderne family, formerly of Leigh Place; attached to one is a Latin inscription dated 1499; another contains whole length brasses of John and Elizabeth Arderne, with small figures of their six children; also a small brass representing the Trinity and an old monument under an arched recess. Among the modern tablets are these:—To Richard Caffyn Dendy, Esq., of Leigh Place, who died in 1832; to J. W. Freshfield, of Mynthurst, many years M.P. for Penryn and Falmouth, died 1864; also to Rev. G. Whitlock, vicar of this parish, born 1795, died July, 1871.

The register dates from the year 1579. Leigh is a polling-place for Mid-Surrey.

The manor of Brockham was granted in 1254 to John Fitz-Adrian, and the green was common land. It is encircled by nearly as pretty a village as any in Surrey, and has a church (Christ Church), now the centre of a separate ecclesiastical district.

A pleasant walk by the river and over fields connects the villages of Brockham and Betchworth, crossing the churchyard of the latter and passing out through a memorial gateway into the street of Betchworth. The word betch in Welsh signifies a rising ground or ridge. In 1316 John, Earl Warren, was lord of this manor.

Broom Park (now occupied by Mr. C. Dobson) was the residence of the late Sir Benjamin Brodie, and is still in the family, as is also Brockham Warren.

In Betchworth Church is a marble tablet with a medallion portrait, "In memory of Sir Benjamin Collins Brodie, Bart., Sergeant-Surgeon to the Queen, President of the Royal Society. Born 1783, died 1862. By his surgical skill he alleviated the sufferings of his own generation, and conferred lasting blessings on mankind." "Also of Anne, his beloved and devoted wife."

Nearly a mile and a half from Betchworth village, in the parish of Dorking, are the ruins of Betchworth Castle. The estate was once known as West Betchworth. The manor belonged to Richard de Tonbridge. "In 1377," it is recorded, "John FitzAllan, second son of Richard, Earl of Arundel, who died the preceding year, having succeeded to this estate, had license to embattle his manor-house there. A similar license was granted in 1449 to Thomas Brown, Esq., in whose possession this estate then was; he had permission also to impark his manor, and to have free warren in the same; likewise Court-leet and Court-baron, and an annual fair on Tuesday in Whitsun week. In the family of Brown, of which Ambrose was in 1627 created a baronet, this estate continued vested till the death of Sir Adam in 1690, when it devolved to his sole daughter and heir, married to William Fenwicke, Esq., who pulled down the greater part of the castle and turned the remainder of it into a dwelling-house."

During the ownership of Mr. Henry Peters the estate was kept up and many improvements made; his residence at the castle is still remembered. It came into the possession of Mr. Hope (of Deepdene), who dismantled the house; it is now a picturesque ruin. Portions of the original castle can be distinguished from the rebuilding of 1690. Many of the famous chestnut trees and part of the avenue of elms still remain, while the magnificent triple avenue of limes, 350 yards long, is almost perfect and stands in a direct line to the ruin.

Reigate is situated at the head of the long valley known as Holmsdale Hollow, the entrance to which it commands. In Domesday the town was called Cherchefelle, or the Church in the Field, and afterwards it was called Churchfield in Reigate, the earlier reading of the latter name being "Ridgegate," the passage through the ridge of the North Downs.

In the time of the Confessor the manor belonged to his queen, Edith. A market was granted by Edward III. The town returned two members to Parliament from the reign of Edward I. to that of William IV., and one from 1832 to 1867, when it was disfranchised for corrupt practices.

The parish church, St. Mary's, dates from the beginning of the reign of Henry VII. In the chancel were buried Archbishop Ussher and Lord Howard, commander of the English Navy against the Spanish Armada. He died at Haling House, 1624. Over the vestry is a library formed in 1701 by the Rev. Andrew Cranston, the then vicar, assisted by the great John

* A paper read by Mr. T. H. Alexander at the visit of members of the Upper Norwood Athenæum.

Evelyn and others; it contains 1,700 volumes, some MSS. and early specimens of printing. The register dates from 1546.

Reigate Castle, although now but a name, calls up memories of frowning walls and feudal domination, the site with the remains of moat, keep and dry graffe and the curious cave seeming to make its existence almost a present reality. It is supposed to have been built before the Conquest. The castle is mentioned by Dugdale as belonging to William, Earl Warren. During his ownership it was surrendered in 1516 to Lewis, the Dauphin of France, which event is thus related:—"In the wars between King John and his barons, headed by Lewis the Dauphin against him, this castle held out for the king till the soldiers he had entertained from Flanders deserted him and went to Lewis and some home, the Poitevins only excepted, which so weakened him and his party that Lewis being increased in power left London, and marching towards Winchester won the castle here and divers others in his way to that city, which also yielded to him." It is said that French coins have been found in the moat. Local tradition asserts that in the Barons' Cave, as the excavation under the mound is called, the barons met in conference previous to the signing of Magna Charta at Runnymede, but one county historian dismisses this as follows:—"There is a tradition current that the barons who took arms against King John and extorted from him the grant of the great Charter of Liberties and Forest Charter, held their councils previously to the congress of Runnymede in the Castle of Reigate (a fortress which then belonged to William, Earl of Warren and Earl of Surrey), and Mr. Gough has thus alluded to it in his edition of 'Camden's Britannia,' when speaking of a cavern there under the castle court:—'It is called the Barons' Cave and it is pretended that the barons conferred here before they met King John at Runnymede.' From the circumstantial narrative of the movements of the confederated nobles which is given by Matthew Paris, from the time of their meeting in arms at Stamford in the Easter week until their march to Runnymede in the June following, it would seem that the above story is altogether unworthy of credence. Besides, as William, Earl of Surrey, was one of those lords who were most firmly attached to the king, and as he did not join the standard of the associated barons till all resistance to their claims appeared hopeless, it cannot be supposed that his castle would be chosen as the place for their deliberations. It is not unlikely, however, that the Earl of Surrey and a few other lords who, like him, for awhile endeavoured to preserve their neutrality in the grand contest between the sovereign and his most indignant subjects, may have held secret consultations at Reigate Castle and even in the cavern or crypt to which the tradition refers, and which hence, possibly, obtained the appellation of the Barons' Cave.'

The cave is now entered from what was the fosse gate, whence a passage leads to a small gate opening into the castle court; branching from this passage is the Barons' Cave, a long curved crypt with pointed roof, cut out of the hard sand and having a rough bench of masonry across the end. The guard chamber, also branching out of the passage, is not indicated in the old maps, and is probably comparatively modern. There is no reason to doubt the antiquity of the remainder, which may be as old as the castle. In a document of the time of Henry VII. mention is made of the Constable of the Castle of Reigate.

The castle, although probably an important seat of the Earls of Warren and Surrey, was suffered to fall into decay, though at what period is not known. A survey, made in the twenty-first year of James I., states:—"Sir Roger James holdeth from year to year, at will of the Lords, the site of the Castle of Reygate, with the Warren and Lodge there, called the Castle Warren, containing 17 acres, 0 roods, 16 perches, worth, together with the profit of the counyes (rabbits) there, £X, for which he payeth yearly £VIII. And that the Lords of this house have a decayed castle, with a very small house, and a connie warren belonging thereto, now in the occupation of Sir Roger James."

Notwithstanding the dilapidation here alluded to, the castle is presumed to have been in a state capable of being rendered defensible, since the House of Commons judged it necessary (July 4, 1648) to refer it to their committee at Derby House to take care of it, and to put it in such a condition that no use might be made of it to the endangering of the peace of the kingdom. The "Magna Britannia" describes it as "now much ruinated, but there are remaining many of the works underground, though very imperfect, as a vault or cave leading to a door that opens into the graffe, or dry ditch, the water cave that goes under the moat and is full of water," &c. Standing as the castle did on high ground and on a subsoil of sand, there was no natural moat. In 1813, in cleaning it out, a lining of clay, 18 inches thick, was discovered, showing how the old builders had made it impervious. In 1777 the present castellated archway (sometimes described as the only vestige of the original structure) was erected by Mr. Barnes, an attorney, of Reigate, who wrote a Latin inscription for it, but which was never placed. In 1804 a very long spur was dug up in the grounds.

Part of the site of the castle and a considerable portion of the moat are in private occupation. The late Lord Somers granted the remaining portion to the Corporation of Reigate, under whose care it has been laid out as a public garden. Here the dry fosse surrounding the keep, part of the moat and the line of the outer wall may be traced. A story is sometimes told of an underground passage from the castle to the priory, or to Bletchingley—(a few miles is nothing in a legend). It need scarcely be said that this is without foundation. A public footpath encircling the south-west part of the grounds is suggestive of the ramparts of some old town. The garden walls on one side—old and probably built of the former castle walls—the irregular gabled backs of the houses below, and the roofs and chimneys of the town beyond, make up an almost Mediæval picture.

THE LATE H. H. BRIDGMAN.

THE news of the death on Thursday afternoon of last week of Mr. H. H. Bridgman, for many years an active member of the Corporation for the ward of Cheap, will be received, says the *City Press*, with keen regret by a large circle of friends, not only in the City, but in St. Pancras and various other districts of London. Coupled, however, with the regret that will be felt at the loss of so striking a personality, and the sympathy that will be expressed with the widow and family in their sad bereavement, will be a sense of thankfulness that at last the terrible suffering experienced for a long course of years has been brought to a termination by the merciful hand of death. The painful internal malady with which he was seized three or four years ago, necessitating a series of painful and dangerous operations, and involving his practical retirement from professional and municipal work, was from the first understood to be incurable, the patient himself, as well as his medical advisers and his relatives and friends, realising that there could be but one issue to the suffering. At the time he underwent his first operation hopes were entertained, however, that life might be spared for some years, and that, to a certain extent, health and strength would be temporarily restored; but, unfortunately, that hope was soon proved to be groundless, and Mr. Bridgman became to all intents and purposes a confirmed invalid. Up to a few weeks ago, as the readers of the *City Press* have been informed from time to time, the progress of the malady was slow, but during the past week a gradual change for the worse was noticeable in the patient, and the end came, as already stated, on Thursday, at about midday, the closing hours of life, happily, being marked by no suffering. A widow and family of eight are left to mourn their loss. The funeral took place on Monday afternoon at Highgate Cemetery.

The death of Mr. Bridgman removes from the City one of the most prominent personalities of the past few years. Clever as an architect, brilliant as a speaker, the possessor of an original mind, and endowed with the most versatile gifts, Mr. Bridgman, in his professional career, as a corporator and in the various walks of life he followed, achieved a distinction that few men have the good fortune to win for themselves. The success he achieved is the more to be noted in view of the fact that, at any rate during the closing years of his life, it was his misfortune to be compelled to contend, not only with the inroads of disease, but with worries arising from circumstances into which it is needless now to enter, but in which he received widespread sympathy from all who enjoyed the pleasure of his acquaintance.

Mr Bridgman was a native of Torquay, being a grandson of Mr. John Bridgman, one of the pioneers of this now popular watering-place in the early days of the present century. He was born in the year 1844, and received his education at Chumleigh Grammar School under the Rev. George Moyle, M.A. His school days over, he commenced his professional career as an architect and surveyor on the Cary estates of his native town, and for the next six or seven years devoted the whole of his time and attention to promoting the development of this popular seaside resort. Even at this early stage in his career the brilliance he subsequently displayed was manifested, and in architectural competitions many and valuable were the prizes that fell to his lot. In his leisure moments Mr. Bridgman from his very earliest years gave proofs of that remarkable energy with which he was endowed. He was one of the pioneers, for instance, of the Torquay School of Science and Art, becoming in time a pupil, hon. secretary and assistant-master, while he was also the recipient of one of the first prizes awarded to the school by the South Kensington Science and Art Department. The esteem he thus won for himself by the interest he showed in local institutions was evidenced by his being presented with several valuable testimonials when he left the town in the year 1867, in order to commence a professional career in the Metropolis.

On his arrival in London Mr. Bridgman, by means of an intro-

duction of the late Lord Haldon, secured a position of trust in the office of Mr. John Gilson, the pupil of Sir Charles Barry during the building of the Houses of Parliament, and at the time of which we are speaking an architect of great repute. The opportunities thus afforded the young Devonian of making a mark in his profession he availed himself to the full of, and in a short while he succeeded in winning for himself a prominent position among his professional brethren. Two years after his arrival in London he obtained his first public appointment, being elected one of the surveyors of the St. Pancras Vestry. Two years later he commenced to practise on his own account, and in the year 1875, upon the death of his brother, Mr. Albert Bridgman, he succeeded to that gentleman's business and removed to 42 Poultry. The columns of the *City Press* are not the proper place in which to refer at length to his professional career, but a few of the leading works in which he was engaged, and some of the successes he achieved therein may be touched upon as evidences of his ability. Perhaps the success he prized most was won in connection with the Westgarth competition for the best essay on street realignment and reconstruction in Central London. Many rising architects took part in this contest, and the fact that his effort was deemed worthy of the first prize affords conclusive evidence of the thoroughness with which he had studied the problem and the ready conception he had of the manner in which the future needs of the growing traffic of the Metropolis might be satisfactorily met. On several occasions in the columns of the *City Press* reference has been made to the scheme thus devised, and it will be remembered, perhaps, that only so recently as the close of last year, following the great fire in Cripplegate, the scheme was referred to as possessing features well worthy of adoption by the municipal authorities. Mr. Bridgman was the architect of the central fish market that it was proposed to erect on the Lambeth side of the Thames between Waterloo and Charing Cross railway bridges, and for his plans he was awarded at the International Fisheries Exhibition a prize of fifty guineas offered by the Corporation of Liverpool. Amongst the buildings erected according to his designs were the extensions of St. Pancras Workhouse, the Camden Baths and a block of shops and offices in Queen Street. He was also the originator of numerous improvements that have since been widely adopted by architects and builders throughout the country.

It was in the year 1884 that Mr. Bridgman entered upon municipal life, following a close connection of several years standing with the parochial administration of the ward in which he carried on his practice. From the first it was realised that Cheap's new representative was a "coming man," and in a very short while the anticipations thus formed were realised, and Mr. Bridgman took in the deliberations of the court the prominent part he filled until his final retirement. The chairmanships he held were several in number, and in connection with each the work he achieved was of a character that rendered his term of office a noticeable one in civic administration. As chairman of the law and city courts committee, for instance, it fell to his lot to officiate at the laying, by the Lord Chancellor (Lord Halsbury), of the foundation of the new City of London Court. During his year of office as chairman of the gas and water committee several clauses of great moment to the ratepayers and consumers were—to a great extent owing to his initiative—introduced into the Bills promoted by the various water companies in connection with the creation of new capital. One such clause paved the way for the purchase of certain undertakings by municipalities, and for awhile it seemed that an opportunity of putting an end to a monopoly so burdensome to the ratepayers would be taken advantage of. A lengthy inquiry was held at the instance of the Corporation, and, as a result, the Bill for appointing a water commission for the Metropolis was promoted. Unfortunately the legislative proposal proved abortive, and a reform so urgently called for failed to secure Parliamentary sanction. It was also during his year of office that the Bill was introduced and placed on the Statute Book for enabling the Corporation to hold a fire inquest on the occasion of any outbreak of doubtful origin occurring in the City. A little later Mr. Bridgman was appointed the chairman of the streets committee of the Commission of Sewers, and it was during his term of office that the present scheme of lighting the City by electricity was promulgated. For his services in this direction he received the thanks of the committee in a practical and gratifying form. Later he had the distinction of being chosen as the chairman of the Sewers Commission, his year of office being marked by several events of no little importance. For instance, it was at his suggestion that the rebuilding of Moorgate Street station was insisted upon, whilst he was responsible in a great measure for the carrying through of the scheme that led to the retirement of Colonel Haywood and the appointment of the present engineer. It is impossible in the space at disposal to comment upon the various other enterprises with which as a commissioner he became identified. It may, however, be mentioned that he was the first to suggest the construction of subways under the crossings at Mansion House Street for the purpose of facilitating the traffic at that point. The plans submitted, it is true, failed to secure approval, but to a certain extent the idea thus ventilated has been used in connection with the underground railway, and a few months hence will see the practical adoption, in some measure at all events, of the project originated by the subject of our sketch. Throughout his connection with the Commission the matter of improvements received his constant attention, and the desirable change now about to be carried out at the western end of Cheapside was fathered by him and advocated in and out of season until finally agreed to by the authorities.

Touching on his work as a corporator, it may be mentioned that as a member of the City of London School committee he took an active part in the reorganisation of the school following the retirement of Dr. Abbott, and the formation, under Mr. A. T. Pollard, the present head master, of a modern side. It was also on his suggestion that the Corporation celebrated the 700th anniversary of the mayoralty, and many of our readers will remember the eloquent speech in which, at Guildhall, he introduced the subject to notice, and pointed to the many historical incidents with which, in the course of the period referred to, the City and its chiefs had been closely associated. From that time until the inroads of disease compelled him to lay down his pen, he had devoted his hours of leisure to the completion of an exhaustive work dealing with the history of the mayoralty, and summarising the events of historical significance. It is to be hoped that in some way the result of his labours will ere long see the light, and that a work that cannot fail to be of the utmost interest to lovers of the City will eventually be published. Mr. Bridgman held office as corporator for the ward of Cheap from the year 1884 to St. Thomas's Day, 1896, and on the election of the late Mr. Alderman Halse as successor to Sir James Whitehead, Bart., he was appointed deputy to the ward. The office, however, he was compelled a few months later to resign, owing to failing health, and his consequent withdrawal from municipal life.

Summarising the other appointments Mr. Bridgman held, it may be mentioned that he served on three occasions the office of churchwarden of St. Mary Colechurch, and also acted for some years as overseer; was a member of the Glovers, Wheelwrights and Paviors' Companies, being a member of the Court of Assistants of the last-named guild, and was also one of the professional advisers of the London Chamber of Arbitration. His abilities were in no way confined to the "one square mile," but on the contrary, for many years he was closely identified with various municipal, parochial and charitable institutions connected with St. Pancras. In that district his death will be felt no less keenly than will be the case in the City. A Liberal in politics, Mr. Bridgman in the year 1892 unsuccessfully contested Taunton in the Gladstonian interest. He was a past-president of the United Wards Club, and a member of the Ward of Cheap Club, and of several other local institutions. He was also a member of the Society of Arts and of the London Middlesex Archæological Society, whilst the clubs to which he belonged were the National Liberal and the Devonshire.

MICHELHAM PRIORY.

ON Monday some members of the Sussex Archæological Society visited Michelham Priory. Situated on the banks of the Cuckmere, and removed in these latter days from the more frequented haunts of men, the priory with its well-preserved gatehouse is, says the *Sussex Daily News*, a delightfully picturesque place, and the archæologist, the artist and the simple lover of nature may together find manifold charms within its grounds. The property has only lately been acquired by Mr. Gwynne, who has been at some pains to discover the remains of the ancient buildings which had been masked by subsequent plantations. He has succeeded in doing much in this direction, laying bare the bases of the walls of the church and other buildings which were razed to the ground, disclosing some features of the architecture which indicate the graceful style adopted by the designers of the place, and by a general clearance of the accumulated rubbish of years of neglect exhibiting the better known portions of the priory which are standing in a manner which enables them to be appreciated. The general result is therefore eminently satisfactory.

Mr. H. Michell Whitley on Monday undertook the office of guide. In the course of some general observations he said the priory was founded in the early part of the thirteenth century by Gilbert de Aguila, of Pevensey Castle, Lord of the Eagle, and the last Lord of Pevensey of his race. The foundation was for Austin Canons or Black Canons regular of the Order of St. Augustine, an Order less strict than ordinary monks, wearing beards and caps on their heads and being attired in long cassocks with a white rochet over them. They were also furnished with a black cloak and hood. Gilbert gave to the priory his lordship of Michelham, his park of Pevensey, comprising between 800 and 900 acres, meadow lands, &c., timber

for their church and buildings, and the churches of Hailsham and Leyton. Here upon a rich soil they erected their priory buildings, which they surrounded by a moat, with The Decker, a great common, on the west and a great forest on the north. The entrance gateway, which was almost intact, dated from the latter part of the fifteenth or the early part of the sixteenth centuries. It was approached by a bridge of solid masonry, a timber bridge or drawbridge reaching over the gap now spanned by the small arch. He did not think that a regular drawbridge, with chains, as at Herstmonceux and Bodiam, had ever been used, but probably there was a light bridge which could be raised whenever necessary. Below the gatehouse was a room said to be a dungeon, but he thought it was more probably used as a cellar; while above the archway were two rooms in the tower with fireplaces, which were worthy of inspection. He mentioned also that the view from the top of the tower over the surrounding country was very fine; and taking this hint a goodly number of the visitors afterwards found their way up the narrow winding stone stairs and climbed out on to the leads, where indeed they were amply rewarded by the prospect thence commanded. Continuing, Mr. Michell Whitley remarked that the almonry and guest house for poor people probably stood on the bank at the north-east of the gatehouse, where numerous remains of buildings had been found by Mr. Gwynne. At all events, they stood somewhere in the outer court and were an important adjunct to the priory, for, however secluded the situation of Michelham now was, in Mediæval times it was on the main thoroughfare from Lewes through Hailsham to Battle and Hastings, which was well frequented. Indeed, in 1398, the advowsons of Alfriston and Fletching were bestowed on the priory, having regard, among other things, to the great cost the canons were put to in maintaining the hospitality imposed upon them by their proximity to the king's highway, frequented by the nobility of the kingdom and other travellers. The priory itself, standing back from the gatehouse, to which he next directed attention, was an Elizabethan house, about two-thirds of which had been pulled down to the ground, and to the third which remained had been added a building with mullioned windows, which was not a part of the original priory. The buildings must have been enormous, for when they were pulled down large quantities of brass and lead were sold. An extract from the official records, dated 1536, set forth the sale of 203 ounces of silver, realising 27*l.* 13*s.* 0½*d.*; all the ornaments of the church, the painted tablet stones called "paving stones," and other things below the said church were sold for 15*l.* 13*s.* 4*d.*; the movable articles in the guesthouse for 18*l.* 0*s.* 2*d.*, and the store of cattle for 78*l.* 5*s.* Thirteen waggon loads and 1,500 lbs. of lead were also disposed of; the bells, of which there were five, and which weighed 40 cwt., were sold for 26*l.* 13*s.* 4*d.*, and the various buildings were sold to divers persons for 16*l.* 9*s.* 3*d.* From another return he gathered that there were at the time of the dissolution of the priory eight canons and one novice, with twenty-four servants, eighteen waiting servants and four hinds. From a position in the open square, in the midst of the priory buildings, which he described as the cloister garth, Mr. Michell Whitley remarked that around this square, or nearly square grass plot stood the conventual church and buildings. In 1398 the buildings were spoken of as in a ruinous condition, some in part having actually fallen down, and again in 1478 the two mills belonging to the priory were in utter ruin, and the dormitory-house, with other houses and buildings, was in a bad condition. Extensive repairs must have followed, however, for in 1535 the buildings were returned as being in good order.

With the aid of a plan Mr. Michell Whitley then proceeded to indicate the probable position of the various priory buildings. The church, which in this instance, he thought, was situated to the north—his theory being that the position of the church was determined largely by the slope of the ground and questions of drainage—was aisleless and cruciform, with a central tower. On the east side of the cloister garth were the sacristy, a slype to the infirmary and the monks' cemetery, the chapter-house, the regular parlour for conversation, and the warming-house, where the brethren might have a fire, the dormitory for the canons being overhead on this side; on the south was the frater and kitchen, and on the west the cellarer building with the abbot's chamber. With the information so interestingly and kindly imparted, the visitors proceeded on a round of independent inspection, and among other features of note was a very fine crypt which Mr. Gwynne had taken care to fully expose.

The Competitive Designs for the Old Town Street improvement, Plymouth, for which a premium of 250*l.* is offered by the Corporation, have to be delivered to the borough surveyor by the 24th inst. Owing to the differences which arose with respect to some of the conditions imposed by the town authorities, it is understood that none of the local architects will be represented in the competition.

TESSERÆ.

The French Academy in Rome.

FRANCE possesses in Rome an admirably regulated academy of art, instituted in the year 1666 by Louis XIV., on the instance of the painter Le Brun. It is maintained for the advantage of young artists who display talent in a more than ordinary degree, and who are provided with means for their journey to and supported during their stay in order by the study of its works of art to imbibe inspirations and approach nearer to perfection in their own labours. Its place of reunion in 1725 was a large house on the Corso, opposite the Doria Panfili palace, which had been purchased by Louis XV. from the Duke de Nevers; at that time its body consisted of a director and twelve young students pensioned by the French Court, always the munificent patron of the fine arts. At one time prevailed an affected and mannered style, which Mengs called spirituel, and which, according to him, consisted in "transgressing the limits of the just and beautiful, overcharging both, exaggerating in all things, and aspiring to please the eye rather than the understanding." M. Sublegris, who was educated in this Academy, reformed that style, preserving all that was excellent in it, rejecting the feeble, and adding what sufficed to form a manner genuinely original. At the commencement of the present century the French Court effected an exchange with that of Tuscany, and transferred the Academy to the palace of the Villa Medici, on the summit of Monte Pincio. This is a most agreeable residence, with spacious avenues, groves, fountains, besides a sumptuous palace with two fine façades, commanding a beautiful view of the city and its environs and enjoying the best air. It was formerly the residence of Cardinal Alessandro de' Medici, afterwards Pope Leo XI., subsequently of the Ambassador of Tuscany at the Holy See. The inner façade is said to be from the design of Michel Angelo Buonarroti, and many antique sculptures are enchased in its walls. The famed statues of the Venus of Cleomene, called the Medicean; of the Apollo known as the Apollino; of the Scythian, called the knife-grinder; of the Mercury in bronze, and of the family of Niobe, which now adorn the Ducal Museum at Florence, were once all located here, with many others which would still be the pride of Rome if the law had always been in force which prohibits the exportation of works of art by the first masters.

The Pegna.

The gladiatorial combats in the Roman arenas were occasionally enhanced by structures that are suggestive of modern stage managements. At times was erected in the midst of the arena a machine called the pegna, resembling a tower, whose different storeys were garrisoned, its apex crowned with weapons and armour the prize of victory. These were besieged and taken, unless successfully defended, to represent the assault of a fortress. The pegna were made with such skill of mechanism as to open and close, to increase and diminish their altitude as if spontaneously. They were sometimes painted, at others plated over with gold and silver, their recesses were often filled with persons condemned to death, when the pegna was made to fall to pieces, precipitating these among the wild beasts. Under Diocletian the exhibition of these towers in a blaze of fire, which yet did not hurt the material, was carried to great magnificence.

The Painting of the Ancients.

From the various ancient paintings which have come down to us we may form a judgment with tolerable accuracy of the excellences and the defects of the art amongst the ancients. There can be no doubt but that the same correctness of design was required from the painter as from the sculptor. If what has happened in the case of sculpture had likewise happened in regard to their paintings, and we had the good fortune to possess what the ancients themselves esteemed their masterpieces, we should find their figures as correctly drawn as the Laocoon and probably coloured like Titian. What disposes us to think higher of their colouring than any remains of ancient painting will warrant is the account which Pliny gives of the mode of operation used by Apelles—that over his finished picture he spread a transparent liquid like ink, of which the effect was to give brilliancy and at the same time to lower the too great glare of the colour. This passage, though it may possibly perplex the critics, is a true and an artist-like description of the effect of glazing or scumbling such as was practised by Titian and the rest of the Venetian painters. This custom or mode of operation implies at least a true taste of that in which the excellence of colouring consists, which does not proceed from fine colours but true colours, from breaking down these fine colours which would appear too raw to a deep-toned brightness. Perhaps the manner in which Correggio practised the art of glazing was still more like that of Apelles, which was only perceptible to those who looked close to the picture, whereas in Titian, and still more in Bassano and others his imitators, it was apparent on the slightest inspection. Artists who may not approve of glazing must still acknowledge that this practice is not that of ignorance. Another circumstance

that tends to convince us in favour of their colouring is the account we have of some of their principal painters using but four colours only. The fewer the colours the cleaner will be the effect of those colours, and four are sufficient to make every combination required. Two colours mixed together will not preserve the brightness of either of them single, nor will three be as bright as two; of this observation, simple as it is, an artist who wishes to colour bright will know the value. In regard to their power of giving peculiar expression no correct judgment can be formed, but we cannot well suppose that men who were capable of giving that general grandeur of character which so eminently distinguishes their works in sculpture were incapable of expressing peculiar passions.

The Beautiful in Art.

When beauty is said to be the proper end of art, it must not be understood as confining the choice to one set of objects, or as breaking down the boundaries and destroying the natural classes, orders and divisions of things (which cannot be too carefully kept entire and distinct); but as meaning the perfection of each subject in its kind, in regard to form, colour and all its other associated and consistent attributes. In this qualified and proper acceptation of the word in regard to art, it may be applied to nearly all things most excellent in their different ways. Thus we have various modes of beauty in the statues of the Venus, the Juno, the Niobe, the Antinous and the Apollo, and thus we may speak, without exciting a confusion of ideas, of a beautiful peasant as well as of a beautiful princess, of a beautiful child or a beautiful old man, of a beautiful cottage, a beautiful church, a beautiful palace, or even of a beautiful ruin. The discovery or conception of this great and perfect idea of things, of nature in its purest and most essential form, unimpaired by disease, unmutilated by accident and unsophisticated by local habits and temporary fashions, and the exemplification of it in practice by getting above individual imitation, rising from the species to the genus and uniting in every subject all the perfection of which it is capable in its kind, is the highest and ultimate exertion of human genius. Hitherto shalt thou go and no further—every step in every direction from this pole of truth is alike retrograde—for to generalise beyond the boundaries of character, to compose figures of no specific age, sex, or destination, with no predominant quality or particular end to be answered in their construction, is to violate propriety, destroy interest and lose the very essence of beauty in contemptible nothingness and insipidity. Conceptions of beauty or perfection take place involuntarily in the mind, through the medium of that wonderful and powerful principle, the association of ideas; but they will be very far from distinct or correct, unless we also employ much study of the laws of nature, investigate closely her methods of attaining her purposes, observe accurately her rules of proportion, and how they are varied in every department of character, develop the connection of mind with matter, trace their reciprocal effects on each other, and learn in all cases to distinguish the harmonious, consistent and energetic from the absurd, superfluous and inefficient combinations of parts and principles.

The "Dance of Death."

The *Dance of Death* of the churchyard of the Predicants of the suburbs of St. John, at Basil, is always ascribed to Holbein, and is shown to strangers through a grate. And yet, as Vertue observed, our painter had undoubtedly no hand in it. Pope Eugenius IV. appointed the Council of Basil in 1431, and it sat there fifteen years, during which time a plague raged that carried off all degrees of people. On the cessation of it, the work in question was immediated painted as a memorial of that calamity. Holbein could not be the original painter, for he was not born till 1498, nor had any hand in the part that was added in 1529, at which time he had left Basil. Even if he had been there when it was done (which was about the time of his short return thither) it is not probable that mention of him would have been omitted in the inscription which the magistrates caused to be placed under those paintings, especially when the name of one Hugo Klauber, a painter who repaired them in 1569, is carefully recorded. But there is a stronger proof of their not being the work of Holbein, and at the same time an evidence of his taste. The paintings at Basil are a dull series of figures, of a pope, emperor, king, queen, &c., each seized by a figure of death; but in the prints which Hollar has given of Holbein's drawings of Death's Dance, a design he borrowed from the work at Basil, there are groups of figures, and a richness of fancy and invention peculiar to himself. Every subject is varied, and adorned with buildings and habits of the times, which he had the singular art of making picturesque.

Sacred Subjects in Sculpture.

Sacred subjects are far more favourable to the grand in sculpture than even the most felicitous inventions of mythology or the sublimest creations of uninspired poetry. The reality with which religion invests everything, the lofty moral which it inculcates, the deep truths which it breathes, awaken and enlist the strongest emotions of the heart, whilst the unequalled grandeur of the great events which it records presents to the chisel of the statuary objects so transcendent and unearthly that the most soaring genius could never have caught a glimpse of them even in his loftiest flights. The severity and dignity too of sacred subjects are most congenial to the grave character of sculpture, which disdains the littleness of the ignoble themes to which it is sometimes prostituted by venality or corrupt taste. Many modern sculptors have produced works which need only be named in justification of the above—Canova, Thorwaldsen, Tenerani and others. As art cannot sustain the duties of its high office unless it continues to be the expression of the soul, of the most intimate sentiment of every age in which it is developed, the influences of Christianity must operate on sculpture as on every other branch, and if these are wanting it cannot be said to answer the demand of the intellect. Even the treatment of classical subjects does not appear to us to satisfy unless those deeper meanings are conveyed which seem at times to foreshadow, or at least harmonise with, Christianity in the fable and poetry of the ancients, as in the story of Prometheus, of Psyche and many of the metamorphoses of Ovid. An immortal feeling, a sense of the infinite, is now looked for in the arts, whether their subjects are ancient or modern, and thus their essence must be Christian, though their forms may be derived from every source, even those of superstition, or history, or poetry.

Patronage of Art.

The truest patronage of the arts of design is that which leaves the choice of subject and the time of action to the unfettered judgment, the unbiassed feeling of him who would give breath to the canvas and to the marble life. The surest encouragement is that which countenances artists by the purchase of those works on which they have bestowed their labour, in giving form and substance to ideas that have originated in their own minds, which puts no limit on subject, no control on treatment, which obtrudes not direction nor insinuates suggestive interference. If patrons such as we have delineated are few, few are the artists who furnish forth unbidden emanations of their genius and specimens of their skill in high art, and for this most obvious of reasons that, having little rational hopes of sale for such works, they have confined their efforts to inferior toil. Such affords a sensible apology for the absence of spontaneous proofs of ability, but, at the same time, it indicates rather the contracted operation of public taste than that the deficient capabilities of artists have chilled the ardour of encouragement. It has neither been the absence of efficient conception nor the proofs of inferiority in execution that has deterred the true patrons of art, but it is the growing utilitarian tastefulness of the age has depressed the genius of artists. The views of profit entertained by the lower class of purchasers have fostered into prominence the efforts of mediocrity and of manual skill, while they have depressed, or at all events discouraged other exertion of mental greatness. "The grossness of pedlary" has banished, or nearly so, from the walls of our exhibition-rooms works in the highest class of art, works that would have emanated from our artists if uncontrolled, self-choosing and self-directing.

GENERAL.

The Caedmon Memorial, Whitby, was unveiled on Wednesday. It is an Anglican cross 20 feet high, and was designed by Mr. Charles Hodges, of Hexham. An address was delivered by the Poet Laureate.

The Spire of St. Michael's Church, Liverpool, which is the highest in the city, stands in need of restoration. About 20 feet of the 215 feet will have to be taken down and rebuilt.

The Grave of Bishop William Cartwright, the last of the Nonjuring Bishops, was discovered this week in Shrewsbury Church. He practised as an apothecary in the town.

The Foundation-stone of the Gloucester Free Library was laid on Friday last. The architects are Messrs. Waller.

At the Sanitary Institute the twenty-sixth course of lectures and demonstrations for sanitary officers will commence on October 17, and will be continued on Mondays, Wednesdays and Fridays, at 8 P.M. The lectures will be given by well-known authorities. There will be also practical inspections and demonstrations.

Brocklesbury Hall, the Lincolnshire seat of the Earl of Yarborough, which was almost completely destroyed by fire last March, is to be rebuilt, and the work is to be commenced at once.

St. Hilda's Mission Church, which has been erected in Parkinson Lane, Halifax, was dedicated on the 15th inst. The church, which has sitting accommodation for 300, has been erected at a cost of about 2,000*l.*

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

BEMBRIDGE BUILDING LAND.

WE referred in our last issue to the important sale of building land situated at Bembridge and Brading Harbour, Isle of Wight, which was to be held on Tuesday last by Messrs. Douglas Young & Co. The sale was duly held, and must be accounted an eminently satisfactory one, as every lot offered was purchased after brisk competition, and the total amount realised was 13,890*l*. The property comprised several large building plots and 520 acres of land which was reclaimed from the sea about twenty years ago and is now principally used for grazing purposes.

Messrs. Douglas Young & Co. announced the sale of the Queen's Park Estate, Brighton, at the Mart on Wednesday, and the Ilford Park Estate, at Ilford, yesterday.

MESSRS. WOOLGAR & ROBERTS'S press-cutting and general information agency notify us that they have removed from 58 to 109 Fleet Street.

A MEMORIAL plaque to the third Marquis of Exeter, grandfather of the present marquis, has been unveiled in the church of the Holy Sepulchre, Northampton. The memorial, erected by past and present officers of the Northamptonshire Militia, of which the deceased nobleman was lieutenant-colonel commandant and honorary colonel for the united period of forty-one years, records the marquis's connection with the regiment and bears the regimental and family mottoes.

ELECTRIC NOTES.

THE Liverpool lighting committee at the periodical meeting decided to extend the electric mains in Newington and Tarleton Street. The electrical engineer's report for the month of August showed that the total supply to private consumers was 119,600 units of electric energy, as compared with 83,260 units supplied during the corresponding period of last year. For Corporation purposes the supply amounted to 142,981 units, as against 104,616 units supplied in August 1897.

AT a meeting of the Kirkcaldy Town Council committee in connection with the proposed electric lighting and tramway schemes, it was unanimously agreed to give notice at once of their intention of applying for a provisional order for the electric lighting, and Parliamentary powers to lay down an electric tramway. The preliminary notices will be issued immediately, and Professor Kennedy is to be asked to supply the plans and all professional advice. The area that will be sought to be lighted with electricity will be the High Street, power being secured to extend the same. The tramway route will be the original plan from West Bridge to Dysart, with circular tour viâ the Den and Victoria Roads.

A START has been made in the construction of an electric railway that is to connect Waterloo with the terminus of the Great Central Railway at St. John's Wood. The work has not yet advanced very far, indeed, it does not extend beyond the erection of a staging in the river, close to Hungerford Bridge. At this point it is intended to sink shafts, through which most of the earth excavated will be brought to the surface. Starting from Waterloo the line will pass under the river at the side of the South-Eastern railway bridge, under the Fire Brigade pier, and then underneath Northumberland Avenue, at the end of which will be a station. The line will then strike across to Oxford Circus, at which point it is proposed to build another station, and thence it will run to the Metropolitan Railway station at Baker Street, and on to the Great Central Railway.

ELECTRIC-LIGHT development in Edinburgh is making rapid strides, as is evidenced from the following figures:—In the first fifteen weeks of 1895-96 equal to 10,450 8 candle-power lamps were joined on and 16,739 were applied for. In the corresponding weeks of 1896-97 4,875 were joined on and 16,712 were applied for. In 1897-98 for the first fifteen weeks 8,882 8 candle-power lamps were joined on and 26,298 applied for. In the present year the committee had joined on in the fifteen weeks from May 15 14,044 and had applications

equal to 29,490 8 candle-power lamps. During the same period the consumption in 1895-96 was 40,640 units ; in 1896-97, 92,312 units ; in 1897-98, 185,021 units, and for the same period this year it had been 375,628 units, showing a steady increase from year to year for the first fifteen weeks of about 100 per cent. The increase for the whole year of 1896-97 over the previous year was 86 per cent., that of 1897-98 over 1896-97 was 88 per cent., and so far this year promised equally well, and it was estimated that there would be an output of 75 per cent. over last year. Taking it at this, there would be 3,463,558 units sold for private lighting at an average price of 3·15*d.*, giving an income from that source of 45,459*l.* 3*s.* 10*d.* The public lighting being 9,940*l.* and 50*l.* from other sources, they had a gross revenue of 55,449*l.* 3*s.* 10*d.* The total expenditure was estimated at 43,949*l.* 3*s.* 10*d.*, including 19,190*l.* for interest and sinking fund, thus leaving a surplus of 11,500*l.* Of this sum the committee recommended the Council to put 7,000*l.* to the reserve fund, raising it at the end of the financial year to 15,000*l.* The balance of 4,500*l.* went in relief of the rates.

THE beginning of work for the conversion of the Broadway cable line into an underground electric railroad will be viewed by New Yorkers with unmixed satisfaction, says the *New York Tribune*. The underground trolley has proved itself to be an unqualified success. It is as much an advance on the jerky cable traction as the cable was on the horse cars which offered an apology for locomotion in our streets long after other cities enjoyed real rapid transit. New York has been behind the times partly through its own fault, but also partly because invention was slow to meet the conditions of our congested streets. The overhead trolley was vastly more convenient, comfortable, and economical than the cable, but it was of necessity barred from our business centres, for the stringing of a network of heavily charged and uninsulated wires over our roadways was not to be thought of. The underground trolley is really a new thing. It seems only a few months ago that experiments were being made in Harlem to find out if it could be used under our winter conditions. The results so far exceeded expectation that the Madison Avenue line was equipped for electricity with the intention of leaving the cable roads in operation for some time to come. But the popularity of the new method is so great that the railroad company has determined to respond to the public desire promptly, and we may hope to see the smooth-running cars in Broadway with the beginning of next summer. The public complacency over the new work in Broadway is in itself a high tribute to the Metropolitan Street Railway Company. That corporation has not done business in New York without earning its share of criticism for failure to respond to the needs of the travelling public. But let a company do as the Metropolitan has recently shown a disposition to do, strive to deal with the people liberally, with the highest regard for their rights, and the people will reward them with enthusiasm. As Mr. Macdona, the counsel for the company, says, a year ago the Metropolitan had seventy-odd injunction suits on hand, while now delegations of property-owners are calling to offer it rights of way through streets where it never thought to go. It is impossible that this goodwill should not add to the profits of the road. Men will not ride in cars which typify niggardly disregard of their convenience when they can patronise people who try to consider their comfort. With the new motive power in Broadway the surface transit facilities will be wonderfully improved, and the parallel lines will so diminish congestion that it may not be utterly utopian to hope that some way may be found to handle the crowds without the present barbarous crowding. If the Metropolitan Company will devote itself with a liberal spirit to that problem instead of giving it up as a bad job at the outset, it is possible that by next year a man may go uptown in Manhattan Island in the busy hours without mauling and humiliation.

BUILDING AND BUILDERS.

A SCHOOL is in course of erection at Cardonald, N.B., at a cost of about 2,000*l.*

TURTON parish church is to be reseated and decorated at a cost of nearly 1,000*l.* Owing to the presence of dry-rot in the floors the work has to be completed immediately.

PLANS have been prepared by Mr. J. Groom, architect, 3 Broad Street Buildings, Liverpool Street, for an important block of warehouses to be erected in Great Arthur Street, Golden Lane.

THE foundation-stone was laid on the 17th inst. of a church in Gerald Road, Pendleton. The building will be erected by the Dominican Fathers, who will expend on it 10,000*l.*

BETWEEN 9,000*l.* and 10,000*l.* are to be expended on a public hall and post-office buildings which are about to be erected at Wells from designs by Mr. John Johnson, architect, 9 Queen Victoria Street.

23 SUTTERTON ST., CALEDONIAN ROAD, LONDON, N

THE foundation-stone was laid on the 15th inst. of a mission church, to be known as St. Saviour's, in the parish of St. John's, Coventry. The new building will seat 300 persons and is estimated to cost 2,600*l.*

A LARGE Primitive Methodist chapel and school premises are in course of erection in Hinckley Road, Leicester, in place of the St. Nicholas Street chapel, which is being demolished for a town improvement.

A SERIOUS accident occurred last week at St. Botolph's Church, Wood Street, Cheapside, which is undergoing repairs. A scaffold fell, so seriously injuring four men that they had to be taken to St. Bartholomew's Hospital.

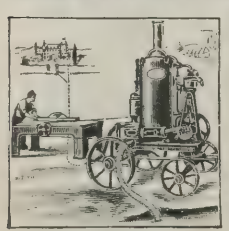
PLANS for the erection of a new isolation hospital at Scarborough at a cost of 15,000*l.* have been passed by the local authority. Thirty-two beds will be provided, sixteen in the scarlet-fever block (four private), ten in the typhoid block (two private), two for measles and diphtheria and two for observation.

THE demolition of old buildings between New Street and Union Street, Birmingham, is to be commenced on November 1, preparatory to the construction of the new arcades. The building contract has been let to Mr. E. J. Charles, of Moseley.

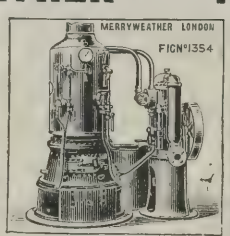
THE excavators, bricklayers and masons' work in connection with the erection and completion of new bank at Ripon, for the Knaresbro' and Claro Banking Company, has been entrusted to Mr. Anthony Lyons, contractor, of Norton Malton, to designs by Mr. Arthur A. Gibson, architect, Harrogate.

THE memorial-stones of a new chapel at Swansea, which will be known as Rhyddings Chapel, were laid on the 8th inst. Mr. P. J. Thomas, of Bridgend, has prepared the plans, and the contract has been let to Messrs. Weaver & Co. The cost of the new chapel is to be about 1,550*l.* It is being built in the Gothic style of architecture, and will seat nearly 550 persons.

THE foundation-stone of the new municipal buildings of Govan, N.B., has been laid. The building, which is situated at the corner of Govan Road and Summertown Road, is being erected at a cost of 32,000*l.*, and will be completed in about eighteen months. When completed, the new buildings will consist of the council chamber, offices for the different burgh departments, a public hall capable of accommodating 2,000 persons and a small public hall to seat 500 persons. The architects are Messrs. Thomson & Sandilands.

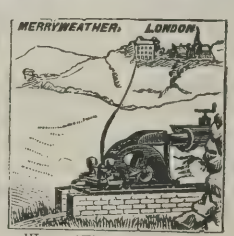


THE memorial-stone was laid last week of St. Stephen's Mission Hall, the erection of which has been commenced on a site in Crown Street, Carlisle. The hall is intended for parish meetings of all kinds as well as religious services, and will accommodate from 120 to 130 persons. The plans have been prepared by Mr. Pogson, architect, and provision has been made whereby the hall can be enlarged so as to seat about 50 more people, or the space may be utilised for class-rooms. Exclusive of the furnishing, the hall will cost about 650*l.*



AT a special meeting of the Town Council of Colchester a letter was received from the Local Government Board sanctioning the necessary loan for the erection of a new town hall at a cost of 36,000*l.*, and the work will at once be proceeded with. The tower and chimes for the new building, estimated to cost 2,000*l.*, will be given by the mayor (Alderman James Paxman, J.P.). The borough member (Sir Weetman Pearson) has contributed a new organ for the assembly-room and gifts of stained-glass windows, statuary and paintings are promised by leading townsmen.

AT a recent meeting of the Aberdeen Harbour Commissioners it was resolved by nineteen to four votes that the graving dock be reconstructed on its present site, that it should be lengthened by moving the site of the entrance eastwards to the extent of 75 feet, that it should be widened and deepened, and that a sliding caisson be substituted for the entrance in place of gates. The floor of the dock will be constructed on a level plane throughout, instead of having a rise of 3 feet. A pontoon dock will also be provided on the south side of Albert Basin. Mr. Henry H. Wake, Mem.Inst.C.E., the board's consulting engineer, estimates the cost of the reconstruction of the dock at 116,211*l.*, to which must be added the sum of 9,251*l.*, being the extra cost of a sliding caisson for the entrance, making together 125,462*l.* This sum is exclusive of the cost of the pontoon dock, amounting to 7,000*l.*



THE Postal Department has decided to expend 200,000*l.* on a scheme which makes provision for dealing more efficiently with the increasing postal and telegraph work in the Metropolis, and under which better accommodation will be provided for the staff. Three new buildings will be erected at once. The east block of St. Martin's-le-Grand will be demolished with the exception of the outward walls, and within a new structure will be erected suited to modern requirements. While the work is in progress a portion of the business will be

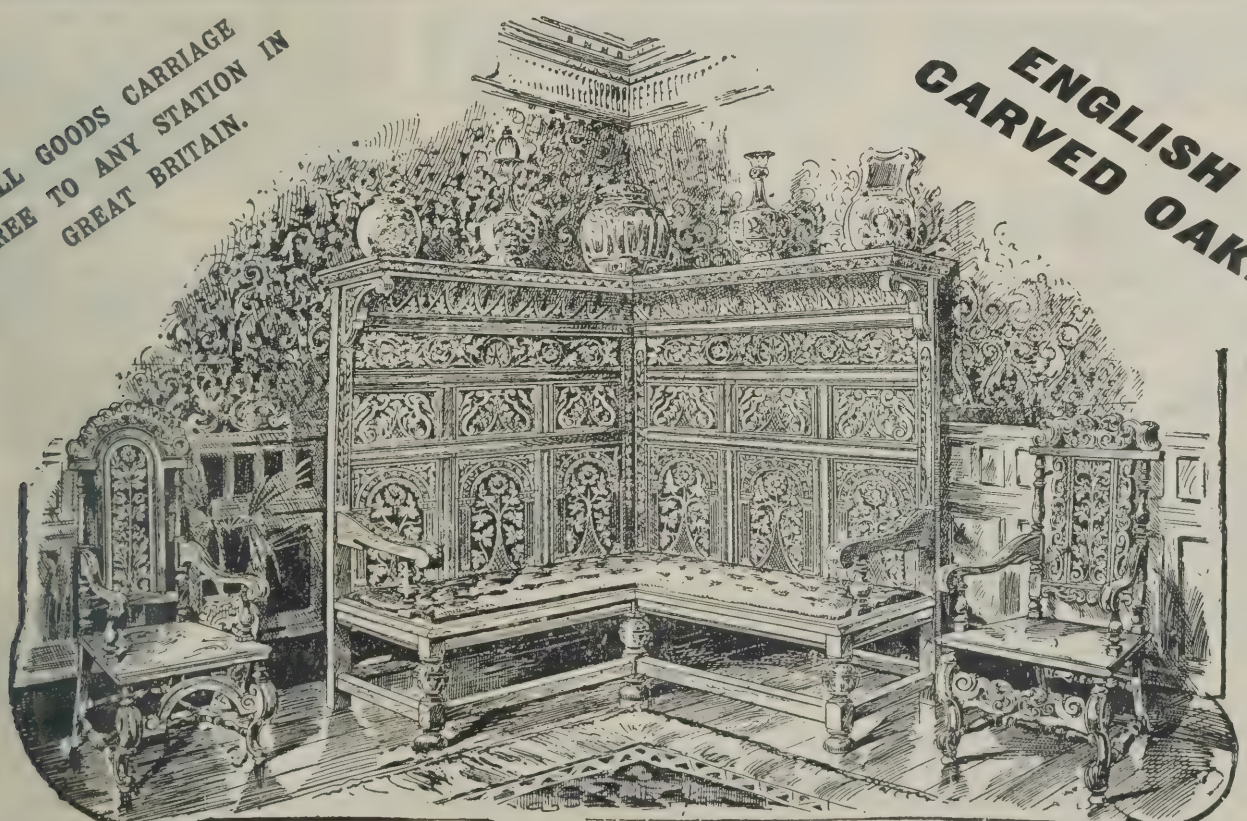
transferred to the Mount Pleasant offices in Clerkenwell, to which a new wing is being added. These parts of the scheme will cost 150,000*l.* The Department has purchased the business premises of Messrs. Barnard & Sons, manufacturing silversmiths, Angel Street and King William Street, which will at once be demolished, and a new building erected on the site, which will provide ample dining and cloak-room accommodation for the staff of 3,000 telegraph clerks at St. Martin's-le-Grand. The sum of 50,000*l.* will be spent on this undertaking. As soon as a suitable site can be obtained, it is proposed to build a new post and telegraph office in the East Strand, where business has developed so rapidly in recent years. The present building has been taken on a short lease from the Duke of Norfolk: but the shop property (including the post office) extending from Surrey Street to Norfolk Street will have to come down shortly, when the leases expire.

THE foundation-stones of a new Baptist chapel, to be erected by the members of the Yates Street chapel, which has now become inadequate to their requirements, were laid recently at Aston Manor. The design of the new structure, which will be built of red brick with stone dressings, is in the old English style of architecture. The body of the chapel measures 65 feet by 40 feet, and will accommodate 400 persons. It is approached by an imposing entrance to Thomas Street and an open porch leading into side lobbies. The building will be heated by means of the low-pressure hot-water system, and special attention has been paid to the acoustic properties.

THE corner-stones of a new Constitutional Club at Farsley have been laid. The building with the furnishings will cost about 2,500*l.* Mr. G. C. Gamble, Bradford, is the architect, and the style adopted is Norman Gothic, with a tower over the entrance. On the ground-floor there will be an entrance-hall, a reading-room and assembly-room, 10 yards by 11 yards, an anteroom and two lock-up shops. The first-floor will contain a billiard-room large enough to hold four tables, a smoke-room and secretary's office. The basement will be utilised for a kitchen, two bath-rooms, heating apparatus and a cellar.



THE foundation-stone of the public library and museum in course of erection at Elmbank, Kilmarnock, was formally laid on the 17th inst. by the wife of the donor, Mr. James Dick, Glasgow, who is a native of the town. The new building is estimated to cost 11,000*l.*, and the style of architecture adopted is Italian, the leading feature of the design being a portico at the main entrance, surmounted by the figure of Britannia and the Kilmarnock arms. The frontage is 138 feet in length, with a depth of 114 feet. On the ground floor are the reading-room, library rooms and lecture-hall. On the first floor the main staircase leads to a spacious vestibule, with dome of coloured glass, to the right and left of which are the two wings of the museum, each having a total area of 1,750 square feet. The architect is Mr. R. S. Ingram, and the principal contractor Mr. Andrew Calderwood.

AT a meeting of Dunoon commissioners held on the 13th inst. it was agreed to borrow 17,800*l.* for the purposes of water extension, hospital, special sewers, roads and pier. It was also agreed to insure the new pier and offices for 16,800*l.*, and to erect turnstiles at the entrance to the pier. A recommendation of the parks committee that power to erect a pavilion be inserted in a bill to be promoted for this and other purposes was agreed to. A proposal for the extension of the electric lighting at the pier and gardens was remitted to a committee. A recommendation of the piers committee to consider the advisability of forming a harbour and esplanade on the East Bay was approved, and remitted to the board in committee. Mr. Bennett gave notice of motion that competitive plans showing improvements in East Bay should be advertised for.

THE erection of the new Italian hospital in Queen Square has been begun, on the site formerly occupied by the institution in the old mansion which was originally the nursery for Queen Anne's children, the adjoining Gloucester Street being named after the little duke. The new building will be an exceedingly handsome one of red brick and stone dressings, and is from the designs of Mr. Cutler, while the contract is held by Messrs. Holloway Bros., of Battersea, the time for the execution of the works ending in July next. The total cost (20,000*l.*) is being borne by Commandatore J. Ortelli, whose benevolence is well known to his fellow-countrymen, though subscriptions towards the fittings and furniture will be gladly received. The façade

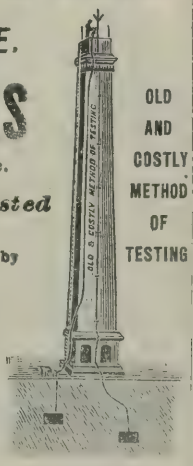
towards Queen Square, where the main entrance is to be situated, is five storeys high, while the Devonshire Street front is broken halfway by a tower surmounted by a dome, which is to form the chapel of the institution. South of this will be a number of isolated wards, where paying patients can also be accommodated, and all the arrangements are planned on the latest scientific and sanitary principles.

TRADE NOTES.

MESSRS. OETZMANN & CO., of the Hampstead Road, have supplied all the stage furniture and appointments for the latest

Drury Lane triumph, "The Great Ruby." Of the richness of mounting of which, some idea can be gained from the above sketch representing one of the principal scenes.



LINO-LATTICE is a name given to a system of sound proofing for floors, partitions, &c., for which it is claimed that it is an absolute preventative of dry-rot, non-inflammable and vermin and insect proof, besides being lighter, cheaper and more efficient than any system now extant. By the lino-lattice system the pugging is laid on lattice-work between the joists, combined with the use of non-conducting sound strips laid on top of the joists or on the face of partition-studs, thereby ensuring the almost complete non-conduction of sound. The non-conducting strips may be used alone, producing, it is said, results far superior to those of any known system. The cost of the entire system per square is about equal to that of the common method of mortar pugging, but the dead weight is less than one-eighth.

THE Union Workhouse Infirmary, Mansfield, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, with descending smoke flues. Messrs. Shorland are also supplying and fixing the apparatus by which the Girls' Intermediate Schools, Cardiff, will be warmed and ventilated.

A NEW penknife-sharpener (Jones's patent) has just been brought out, the object of which is to afford a simple and efficient means of sharpening pen and other knives. It is the acme of simplicity, is complete in itself, and is said to contain sufficient of the sharpening medium to render the instrument effective until worn out, thus dispensing with the necessity of applying any fresh composition or keeping in hand a separate supply. Being always in a semi-moist state, it prevents the blades from heating or softening in the process of sharpening. It is inexpensive (6*d.*), and can be obtained at 75 Alderney Street, S.W.

VARIETIES.

MR. CHARLES WYNDHAM'S new theatre in St. Martin's Court is expected to be ready to be opened in May.

PEMBROKE CHAPEL, Liverpool, long the scene of the ministry of Mr. Augustine Birrell's father, the late Dr. Charles Birrell, has been reopened, after undergoing extensive alterations.

THE dedication of a new Congregational church for Crosby, near Liverpool, took place on the 15th inst. The building has cost nearly 7,000*l.*, and is intended to seat 636 persons.

A NEW girls' school and pupil-teachers' centre, erected by the Smethwick School Board in Crockett's Lane, were opened on Friday last. They were erected at a cost of 6,678*l.*, or 8*l.* 15*s.* 6*d.* per head.

A NEW theatre is to be erected in Harrogate, where such a building is greatly needed, as the Town Hall, which has hitherto had to do duty for the purpose, has become entirely inadequate.

A BEAUTIFUL statue of Apollo standing in the vestibule of the Hartly Institute, in Southampton, was recently thrown over by boys and smashed to pieces. It was of great value, and was presented to the town by a former influential resident.

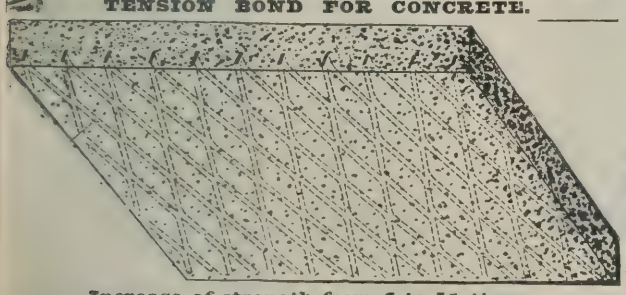
THE school buildings in connection with St. Peter's Church, Horbury, have recently been enlarged by the addition of new classrooms, a movement which was initiated as a local memorial of the Queen's Diamond Jubilee, and were formally opened on the 17th inst.

THE winter session of the lectures and courses of preparation for the Surveyors' Institution examination of March 1899, presided over by Mr. Philip E. Pilditch, F.S.I., &c., are now commencing, and gentlemen desirous of joining should communicate at once with the Secretary, Surveyors' Lectures, 2 Pall Mall East, Charing Cross, S.W.

THE new high school at Keswick was formally opened on the 16th inst. by the Bishop of Hereford. It owes its present important development to the munificence of the late Mr. Henry Hewetson, a native of Keswick, and a successful London merchant, who, by his will, gave 33,000*l.* after the death of his sisters, and in the meantime he provided an annual income of 400*l.*

AT the monthly meeting of the Holywell Urban Council a letter was read from Father Beauclerk asking permission to erect a small crane or windlass at St. Winefride's Well, to help in bathing cripples. It would have to be clamped to the stone buttresses of the well, but would be movable. The council decided to defer consideration of the matter until next season.

PLANS for a new light railway to run from Dover along the eastward cliffs to Martin Mill, near St. Margaret's Bay, were submitted to the Dover District Council. The railway is to cross three public roads on the level, one of which affects the Kent County Council, and the matter had, therefore, to be deferred for submittal to their surveyor.



DURING a recent performance of "The White Blackbird" at the Broadway Theatre, Deptford, considerable excitement was caused by a portion of the ceiling failing on to the heads of several persons in the pit. The ceiling had only been finished a short time, and it is supposed that the portion of it that fell not being thoroughly set, gave way owing to the heat of the building. No serious injury was sustained.

THE council of the borough of West Ham has just completed the erection of a pile of buildings, situate close to Stratford Church, in Romford Road, for use as a public technical institute for the locality. The structure and its environs occupy about an acre and a half, and the cost was some 60,000*l.*

ST. PAUL'S, Goswell Road, which was designed by the late Ewan Christian, and the late vicar of which was the well-known philanthropist, the Rev. Styleman Herring, is now undergoing thorough internal cleaning and decoration in gold and colour, with a large painting in the east end of the church representing the Lord's Supper. The building will be decorated throughout under the direction of the architect, Mr. Romaine Walker.

EVERYONE concerned with the management of the Alexandra Palace is to be congratulated on the brilliant success achieved on Saturday last—the occasion being Pain's benefit—when between 50,000 and 60,000 people assembled and attested their satisfaction with the liberal fare provided. course the staple ingredient in the entertainment, and in addition to the ordinary representation of the destruction of Pompeii, a very brilliant display was given on the south front of the Palace, consisting of a fine set-piece representing the "Taking of Khartoum," flanked on either side by fire-portraits of the Sirdar and Gordon, together with a liberal display of aërial fireworks of every description. During the progress of this portion of the entertainment Hardy, the intrepid American successor to Blondin, performed some astonishing feats on the high wire, but suffered from the disadvantage of attention being divided between his performance and the pyrotechnics. However, he did not seem to take this to heart, and everyone else was satisfied.

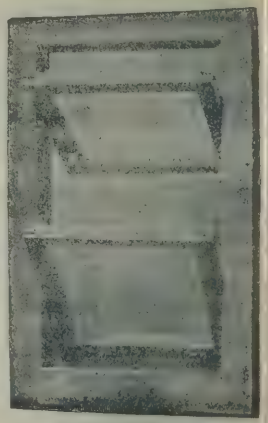
THE new Wesleyan mission hall, opposite the Broad Oaks Works, Hollis Lane, Chesterfield, was formally opened for divine service on the 14th inst. For many years the Wesleyan body in the town have carried on a successful work in the old British School in Hollis Lane, but in consequence of the increase of population in that portion of the borough and the desire of more persons to worship there than could be conveniently accommodated, the officials of the circuit decided to erect a building which would serve the dual purpose of a Sunday school and mission hall. The work progressed rapidly during the summer months, and a very commodious, if somewhat plain and unobtrusive, building is the result. The cost of the structure is 1,500*l.*



THE little church of Holmesfield, which has been closed for three months for renovation and the addition of a chancel, was reopened on the 11th inst. Since it was closed a chancel has been added, the gallery, which extended on the north and west sides of the church, has been left only on the west side, windows being added on the north side, and the old-fashioned high-backed pews have been replaced by more comfortable and more modern seats. The change effected has not only considerably enhanced the appearance of the interior and supplied proper side stalls for the choristers, but has increased the seating accommodation which before the alterations allowed for a congregation numbering 400 persons. The church has also been thoroughly cleaned and painted. The cost of the alterations and additions amounts to 725*l.*

A BUILDING in the course of erection in Govan Road, Govan, collapsed on Monday afternoon, carrying with it a number of workmen, five of whom were killed outright and three were so severely injured that they had to be sent to the Western Infirmary in an ambulance waggon. Willing hands were quickly at work to drag out the buried workmen, which was a matter of much difficulty and danger. The building was occupied in the lower flat as a grocer's establishment, and a grocer's assistant and a woman customer were amongst the injured. An investigation has taken place by order of the Procurator-Fiscal and the municipality of Govan. The experts' reports are being prepared.

THE great tower at the entrance of Haddon Hall is said to be in danger. The large overhanging turret has caused the wall to lean forward, and unless something is done to stop the movement a disaster may occur. A slight settlement of the great curtain wall to the south of the tower, which has occasioned that wall also to lean westwards, has accelerated this movement in the tower. It is recommended that to arrest the movement a new 3-feet thick wall, well bonded to the old walls, should be built back to the fifteenth-century wall. Another proposition is that the lead roofing and gutters, which were found past repair, should be taken up and recast on the site, and then relaid as before, any repairs needed to the roof timbers being undertaken at the same time.

EARLS COLNE (Essex) Grammar School, which has been erected at a cost of 5,000*l.*, was opened on the 13th inst. The building is of red brick, faced with Mark Gentry's bricks, and covered with Thomas Peake's (of Tunstall) "Perfector" tiles. The windows are of Elizabethan style, with lead lights. Half-timbered work is employed under the eaves and in the gables. Entering by the main entrance, a door on the right gives access to a spacious and lofty dining-hall, which is fitted with dog-grate and a finely carved Bath stone chimneypiece specially designed for the house by the architect. The walls are coloured. On the ground floor are also drawing-room, study, kitchen, scullery and china closet. There are five large dormitories on the first floor, two sick-rooms with nurses' room, having easy means of communication with both. The lavatory is fitted with twelve large basins and three baths. The ground floor comprises, in addition to those offices already mentioned, recreation-room, music-room, entrance hall for the boys, cloak-room, vestibule and other offices. The laundry, washhouse, coalhouse, boothouse and other outbuildings are approached by a covered way from the back entrance. A large water-tank is fitted on the tower. Several skylights, in addition to the other windows, provide excellent light at the top of the building. All the rooms are fitted up

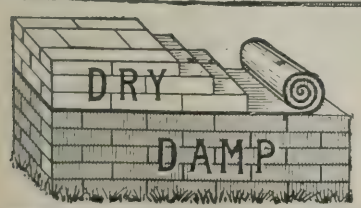
with gas from the Earls Colne gasworks. The master's upstair apartments comprise a number of large bedrooms, dressing-room, bath and lavatory. The kitchen and scullery are fitted up with Ashton and Green's ranges. The front of the house overlooks Chalkney Woods, in the Colne valley. The windows of the large dining-hall contain the twelve signs of the Zodiac. The ceilings are of panelled plaster. The floors are carried on two iron girders, cased, placed on elaborate carved stone corbels. There are several winding staircases, with French polished handrails. The work has been carried out by Mr. Zach. Rogers, contractor, of Earls Colne.

THE new Board schools at Goldsworth, Surrey, were formally opened on Monday last. They occupy a commanding position above the level of the road, and are both substantial and effective in design. The site, about an acre in extent, was purchased by the School Board for 890*l.*, and Mr. S. Welman, architect, instructed to get out plans and specifications. There are two distinct school buildings. The mixed school stands back some distance from the road which it faces, while the infants' occupies a position at right angles to it, on the east side of the site. Fronting the road on the opposite side is the head-master's house. The whole of the buildings correspond in style. Though the big school is a mixed one—boys and girls being taught together—there are separate entrances, opening on to separate playgrounds, each gained in its turn by separate entrance-gates. The infants' school is in the girls' playground. The buildings are of red brick throughout, exterior and interior, the roofs being covered with tiles. The mixed school consists of a hall, 71 feet by 25 feet and 23 feet in height, and five classrooms, one 28 feet by 24 feet 6 inches, three 24 feet 6 inches by 25 feet, and one 20 feet 6 inches by 25 feet. The hall, which is unfurnished, is fitted with horizontal bar, adjustable parallel bars, a set of rings (six), a pair of rings, climbing-rope and a box-horse, with mattresses and other necessary adjuncts. Besides being used for gymnastics and physical drill, the hall will be available for limelight lectures, entertainments and school gatherings in general, for all of which purposes it is eminently suitable. Both hall and classrooms are well lighted, the upper part of the several partitions being of glass. Provision is made for building five additional classrooms on the south side of the hall when such extension becomes necessary. The hall and the two end classrooms are fitted with incandescent gas, and the whole building will be warmed by the Anglo-Canadian hot-water system, the boiler-house being situate under one of the end classrooms. There are altogether eighteen radiators, and iron gratings covering the pipes run along the big hall. Both hall and classrooms, it is needless to say, are thoroughly well ventilated. The two entrance-porches are tiled. The infants' school consists of a big hall, 52 feet by 22 feet, with half-glass folding doors in centre, and one classroom with gallery containing desks for sixty children. This building will be warmed by hot-air stoves and lit by oil lamps. The entrance-porch is similar to those of the mixed school. Two more classrooms may be added to the infants' school when necessity arises. At the rear of each playground is a covered playshed, 40 feet by 18 feet, adjoining which are the usual offices.

DEMOLITION OF BUILDINGS.



A MODE of demolition which would cause less inconvenience than is desirable in torrid weather is suggested by Mr. W. Woodward, architect. He writes:—"An idea which a short time ago I saw being carried out in Nuremberg I have just adopted in the pulling-down of two houses in Regent Street, and with most satisfactory results. I took a main pipe to the top of the old houses, with branches, to each of which was attached an indiarubber hose, with sprinkler at the end. Before the work was pulled down the walls and ceilings were sprinkled with water, and then the débris was likewise sprinkled with water before it was basketted out to the carts in the street. The result was that the usual clouds of dust, with their attendant mischief and annoyance to the public and to shopkeepers, were entirely absent, and the 'wreckers' were at the same time benefited. I venture to commend the idea to the London County Council, who might well insist upon its adoption in all cases of pulling-down old premises in London."

THE SEWERAGE OF DOUGLAS.

THE Town Council of Douglas have had the schemes of several engineers for the drainage of the town before them, and eventually adopted the plans of Mr. G. W. Stevenson for a high and low level system. When, however, the sanction of the Tynwald Court was asked and the matter was referred to a committee of the court, a considerable section of ratepayers opposed the plans on the ground that Douglas could be satis-

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C

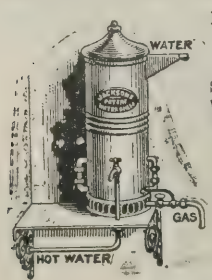
factorily drained by gravitation. The committee asked the Town Council to reconsider the matter. Mr. Stevenson at first thought that he could prepare a sufficient gravitation scheme, but when he went into the question he felt compelled to adhere to the high and low level system. The Council then decided to obtain the opinion of Mr. James Mansergh, C.E. His report virtually endorses Mr. Stevenson's plans, and it is to be gathered that Mr. Mansergh is of opinion that Douglas cannot be satisfactorily sewered unless mechanical means of raising the sewage in the lower part of the town are employed.

THE REGISTRATION OF PLUMBERS.

The annual distribution took place on Monday evening, in the hall of the Manchester Young Men's Christian Association, of prizes gained in connection with a competition and exhibition of plumbers' work which was held in the City Art Gallery last April. The competition was promoted by the Council for Manchester and district of the Association for the National Registration of Plumbers. Mr. W. H. Munro presided, and in a brief address commended the work of the Association. Dr. M. Howe (London) delivered an address on the registration of plumbers and domestic sanitation. He said it was upon the efficiency of a system ensuring the qualification of plumbers and enabling the public to recognise the qualified man that sanitary plumbing materially depended. He urged that registration should be provided for by Act of Parliament. If the Plumbers' Registration Bill became law it would be easier than it now was to maintain the good work carried on by the Association. The trade no less than the public desired it. Public health largely depended upon the quality of the plumber's work. The time had come when the trade should be subjected by Parliament to the control of a national council.

Mr. Lees Knowles, M.P. (who has charge of the Registration of Plumbers Bill in the House of Commons), said that all parties in the House were committed to the principle of the Bill, the main object of which was to afford additional safeguards to the public health by enabling persons employing plumbers to select, if they so desired, men who had given some evidence of qualification. When it was shown that the creation of a monopoly was not intended, opposition to the Bill was withdrawn. The object was worthy of the support of any Government, and he hoped strong representations would be made by supporters of the measure throughout the country which would ensure the early passing of the Bill.

The prizes were then distributed by the Lord Mayor (Mr. Alderman Gibson). The prize work, which is to form the nucleus of a local sanitary museum, was handed over to Mr. J. R. Wilson, as representing the technical instruction committee of the City Council. A resolution in support of a system for the registration of qualified plumbers was passed, and it was decided to invite the City Council and the Salford Borough Council to co-operate in framing a scheme of representation for the two municipalities in the Bill which the Government might be asked to bring in. The Lord Mayor, replying to a vote of thanks, commended the work that is being done by the Registration Council for Manchester and Salford.



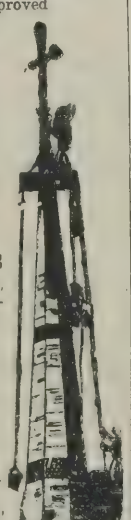
ST. MARY'S CHURCH, BOLSOVER, DERBYSHIRE.

This church, it may be remembered, was almost entirely destroyed by fire on January 24, 1897. The only remaining portions of the old building are the thirteenth-century tower and spire, portions of the outside walls of the fourteenth-century chancel, the Cavendish chapel (erected A.D. 1618) and the north porch and parts of the outside walls of the north aisle and transept (the latter used as a vestry), which were built about twenty years ago.

The former church provided seats for about 500 adults, and it was desired to increase the accommodation as much as possible, retaining the portions of the old building which were not destroyed by fire, and without adding to the length of the church. This has been done by extending the south aisle laterally, about 100 additional seats being thus obtained, the north and south aisles now being of almost equal width, instead of the north aisle being about twice the width of the south aisle, as it was before the fire.

The nave has been made 3 feet 6 inches wider than the one destroyed, thus being restored to the central axis between the western tower and the chancel, as the original thirteenth-century nave evidently was. A triple arrangement of roofs over the nave and aisles has been adopted, the nave arcades being carried on octagonal pillars with capitals, as before.

Most of the remaining portions of the building having been of the fourteenth-century period or style, it has been considered best to build the new portions in the same style, in order to produce as far as possible a harmonious whole.



Medal Awarded Sanitary Institute, Leeds.

J. WEEKS & CO., LIMITED,
KING'S ROAD, CHELSEA, S.W.
Supply all kinds of Boilers, their Improved and other valves, tested Hot-water Pipes, Castings, Connections and Fittings at lowest retail prices.
Telegraph, "Hortulanus, London." Telephone No. 3779.

The external walls are of Bolsover Moor stone, with Weldon stone for the window tracery, &c. Ancaster stone throughout has been used for the interior, the walls, which were formerly plastered, being now lined with stone, those of the tower having been repaired and pointed only. The woodwork of the roofs is chiefly pitch pine, the whole stained palm-leaf green. The roofs are covered with Buttermere green slates. The new roof of the Cavendish chapel is of oak, with carved beams, pendants, &c., and enriched plaster panels, in the Jacobean style and covered with lead. The floors under the seats are of wood blocks. The passages are paved with "terrazzo" and cube marble mosaic. The chancel floor is of marble mosaic, with Devonshire marble steps.

The slab tombstones found in various parts of the church have been relaid in the floors of the transept (vestry) and under the tower. Several ancient stone coffin-lids with incised crosses have also been discovered, and have been fixed round the base of the tower walls inside.

An old piece of carving representing the Nativity (probably part of a fourteenth-century altarpiece) has also been preserved and fixed to the wall inside the porch.

The new carving has been modelled on that in the chapter-house at Southwell Minster. The doors, seats, choir-stalls, &c., are of oak. The font was formerly in Chesterfield parish church, and has been presented to Bolsover Church by the Vicar of Chesterfield. The pulpit, designed by the architect, has been given by Major Hallowes.

The total cost of the rebuilding and restoration, with such fittings and furniture as are at present provided, is about 9,000*l.* Another 1,000*l.* will be required to complete the work.

The architect is Mr. Louis Ambler, A.R.I.B.A., 7 Arundel Street, Strand, London. Mr. J. C. Walker is the clerk of works. Messrs. Bowman & Sons, Stamford, are the contractors.

The heating has been carried out by Mr. James Gray, Chelsea, by hot water, on the low-pressure system.

Messrs. John Taylor & Co., Loughborough, have recast and rehung the bells, with cast-iron framing.

The mosaic floors have been executed by Messrs. Mainzer & Co., Berners Street, London; and the wood-block floors by Messrs. Charteris & Longley, London.

Mr. George Wragge, Salford, Manchester, has made the gasfittings, of wrought-iron and brass.

The fireproof steel door to the Cavendish chapel is by Messrs. Chubb & Sons, London.

Messrs. Jones & Willis, London, have supplied the ornamental wrought-iron door-hinges and furniture.

Mr. C. Lowe, Sheffield, is the organ builder. The organ case is being made by Messrs. Bowman & Sons, from the architect's designs.

Messrs. Smith & Co., Derby, have provided the new clock.

The stone carving has been executed by Messrs. Tuttell & Son, Lincoln.

THE USHER HALL, EDINBURGH.

A SPECIAL meeting of the Edinburgh Town Council was held on the 15th inst., Lord Provost Mitchell Thomson presiding, to consider and, if so advised, to fix upon a site for the Usher Hall. The following motions were given notice of:—

By the Lord Provost and Bailie Sloan: Remit to the Provost's committee to consider and report as to a suitable site for the new city hall to be erected under Mr. Usher's gift.

By Messrs. Cameron and Murray: Remit to the Lord Provost's committee to consider and report as to the area bounded on the south by Lauriston Place, on the west by Graham Street, on the north by Keir Street and on the east by the Vennel, as a suitable site for the Usher Hall.

By Messrs. Gibson and William Gray: Remit to the Lord Provost's committee to consider as a site for the Usher Hall the ground situated to the west of the new Council Chambers and extending towards St. Giles Street.

By Messrs. Waterston and Balfour: That Chambers Street corner and Lindsay Place be chosen as the site under the gift by Mr. Usher.

By Messrs. Brown and Gulland: Remit to the Lord Provost's committee to consider and report as to the suitability of Atholl Crescent and Coates Crescent as a site for the new city hall.

By Messrs. J. C. Dunlop and Innes: That it be remitted to the Lord Provost's committee to look out for a site for the Usher Hall in the line of Melville Street.

The Lord Provost, on taking the chair, said it was extremely probable that they should have another meeting on this subject, and perhaps they might think it advisable that day that they should meet in private. All the particulars in regard to the sites would be brought out again. He moved that the Council go into committee.

Treasurer M'Crae seconded, and the Council sat in private.

The Council in committee had before them the above-mentioned and other sites, which had been located in red colour by Mr. Morham on a large scale map. Among those marked were St. Andrew's Church, James Square, the middle portion of the western division of George Street, north side; George Street and Castle Street, north-west corner; Queen Street Gardens, opposite St. David Street; Queen Street, between Hanover Street and Frederick Street west of No. 22; Queen Street, corner of St. David Street; Earl Grey Street, Alva Street and Queensferry Street, Melville Street and Stafford Street; Melville Street, west division; Atholl and Coates Crescents, in centre of street; centre of Atholl Crescent, with back to Canning Street; Charlotte Square (restricted); Lothian Road, Castle Terrace and Cambridge Street; Lauriston Street, Graham Street, Keir Street and Vennel; High Street, from City Chambers to St. Giles Street; music hall, with buildings on east and west sides. In all twenty-three sites were marked on the map. The Council sat about two and a half hours. The Lord Provost at the outset made a long speech, and was followed by councillors who advocated particular sites. An excellent feeling, it is stated, prevailed throughout, the object of the Lord Provost in guiding the discussion being to get the views of the councillors on a few possible sites which could afterwards be more fully reported on. A good many were submitted, and a show of hands was taken upon them, the result being the inclusion in a leet of the following sites:—(1) High Street from the Council Chambers to St. Giles Street; (2) Atholl Crescent, with the back to Canning Street; (3) George Street and Castle Street corner; (4) Chambers Street corner; and (5) Melville Street and Stafford Street. A remit was made to get particulars regarding these sites against another meeting to be shortly called.

APPLICATIONS OF ELECTRIC POWER.

AT the meeting of the Section of Mechanical Science of the British Association at Bristol on Monday, the 12th inst., Mr. W. H. Preece presided. Three papers were read consecutively and discussed together. They were as follows:—"Electric Power in Workshops," by A. Siemens; "The Application of the Electric Motor to Small Industrial Purposes and its Effect on Trade and on the Community generally," by A. H. Gibbings, and on "Electric Power and its Application on the Three-phase System to the Bristol Waggon and Carriage Works," by W. Geipel.

Mr. Siemens pointed out that the first development in this direction took place in connection with the small line exhibited in Berlin by Dr. Werner Siemens in 1879, and in the present day there is, he considered, little doubt that in the near future horse and steam tramways will disappear altogether. In overcoming heavy gradients the ultimate triumph of electricity is assured. Although even the heaviest goods train can be drawn by electric motors, Mr. Siemens pointed out that it would be a fallacy to deduce that it would be advantageous to replace the steam locomotive on all existing railways by electric motors, as economical factors have to be considered as well as technical features. Electric transmission is best applied where the demand for power is constant rather than intermittent. The paper next dealt with the losses that must be met with in carrying out a system of power transmission by electricity. The first point to consider was that the available mechanical energy had to be converted into electrical energy, and such a transformation involves loss. The ease with which electrical current can be carried and other advantages more than counterbalance this loss, which is not excessive, 84 per cent. of the i.h.p. of a steam-engine being available at the terminals of a dynamo in the form of electrical energy; whilst electric motors will produce over 90 per cent. of the electrical energy supplied to them in the shape of mechanical power. The art of insulating conductors has improved to an extent that, whereas a short time ago currents of 2,000 volts were considered a limit, there are now a number of successful electric systems employing currents of 10,000 volts pressure. The use of alternate currents, the employment of transformers, permits the use of low-pressure generators and motors, high-pressure currents being used in the conductors, but in this there is the loss of double transformation. The author was of opinion, however, that were a trustworthy alternate current motor invented this system of transmitting power would be the dominating one. Unfortunately alternate current motors refuse to start without being first synchronised by external means, are liable to stop when overloaded, and their speed cannot be varied. A continuous current system is simpler and cheaper at first cost and cheaper in maintenance. The installation of electric-power transmission for working the machine tools and other appliances in the works of Siemens Brothers & Co., at Charlton, was next described in detail, the author giving some very valuable figures as to cost, &c. He states that six years' work has shown that the system is perfectly trustworthy, and that an expected great saving in the cost of attending to the motive power has been fully realised. The total cost of motive power during the year 1897 was 9,900*l.*, or 2*d.* per Board of Trade

ectrical unit, and 1·71*d.* per brake horse-power per hour exerted by the motors.

Mr. Gibbings, the city electrical engineer at Bradford, gave a long list of handicrafts to which electrical power might be applied with advantage. Among the obstacles that prevented the introduction of such a system are extreme aversion to innovations which characterise the industrial world, in this country especially; the unsuitability of alternating currents for motors where the power exceeds two or three horse-power; want of confidence. The want of capital to purchase the needed plant is a most practical obstacle, especially in the case of small tradesmen, and he suggested that electric supply undertakings, whether private companies or public corporations, should let out on hire good motors. The paper concluded with a reference to the manner in which the advantage of electric power for small and independent workshops is being recognised in France, Germany, Switzerland and the United States.

Mr. W. Geipel commenced his paper by speaking of the need for economising power on account of the future exhaustion of our best coal deposits. Small scattered steam-engines needed 6 lbs. to 10 lbs. of coal per indicated horse-power per hour, the various sources of loss being dealt with in detail at some length. The author based many of his conclusions on the experience gained by the Bristol Waggon Works, where what appeared, from the author's description, to have been an extremely faulty steam-engine plant has been replaced by a system of electrical transmission. In making this change full consideration was given to the merits and demerits of the direct current and three-phase system. The first cost of the two appeared to be practically the same, but advantages were shown by the three-phase system in regard to absence of commutators and that the current passes direct through clamped terminals. In this system the generators and motors are of better mechanical design, and the three-phase motors can be left running for long periods without attention, even when considerably overloaded. There is also freedom from possibility of breakdown as compared with the direct-current system.

Mr. Preece stated that the inquiry to be conducted as to the best method of employing electric traction on the Underground Railway in London would throw light on the points in dispute, the directors having determined to thoroughly and impartially investigate the subject in all its bearings.

BARRY DOCKS.

A PAPER was read in the Section of Mechanical Science by Mr. R. C. H. Davison, C.E., describing the Barry Docks, with especial reference to the new works. The president of the section, Sir John Wolfe Barry, K.C.B., is the designer of the docks at Barry and consulting engineer to the Barry Railway Company, and Mr. Davison is resident engineer. The first Barry Dock was opened for traffic nine years ago. Some of the largest vessels that have entered Barry Dock are the ss. *European*, of 8,194 gross tonnage, 475·9 feet long, 55·2 feet broad and 35·9 feet deep, and the ss. *Milwaukee*, of 7,317 gross tonnage. The average tonnage, however, of vessels frequenting the dock is about 1,500 tons and the average cargo about 2,500 tons. Dock No. 2 has an area of 34 acres; that of the main dock is 73 acres. The site has been almost entirely reclaimed from the foreshore. The northern side of the dock is for coal export, and will have ten high-level fixed tips and two high-level traversers; the southern and western walls are for imports, and will have twenty-one movable hydraulic pedestal cranes, and a quay space behind them of over 600 feet in depth. The eastern wall has an 80 feet entrance built in it, the lower portion being temporarily built up, leaving a depth of 5 feet at high water on neap tides. This entrance leads into a timber pond of six acres, and by passing by a 20-feet opening through the railway embankment that encircles it, another timber pond of 35 acres is entered. To provide for locking at neap tides the latter can be used as a reservoir of water for the docks, as the 20-feet passage will be fitted with wooden gates. The tip towers on which the tips stand are 300 feet apart and of masonry. Those at the western end have pitched slopes between them, and those at the eastern end where the foundation is good have walls. The object of projecting the tips beyond the line of the dock side is to enable vessels to scarf; that is, the bow of a vessel at one tip can lie inside the stern of the vessel at the next tip, and so on. The dock walls, excepting those between the tip towers, are vertical, and of rubble masonry, the top 20 feet having a punched face projecting forward so as to cover the rock face-work of the lower portion. The height of the walls from dock bottom to coping is 46 feet 6 inches. The southern wall is 3,338 feet long, and straight. The hydraulic pipes and mains are carried at the back of the walls under the crane roads. The foundations are on marl or magnesium limestone, and no difficulties were experienced in the dock, except in making the slopes and getting in the deep foundations, when some slips took place. The junction-cut joining the two docks is 1,000 feet long, the width at the main dock being 130 feet, which narrows to 80 feet as it enters Dock No. 2 through a masonry passage. At this passage there is a sliding wrought-iron box caisson gate, 88 feet long and 20 feet broad, with a lifting deck to carry the road and railway traffic. When not in use the deck is lowered and the caisson slid into a recess under the quay. The caisson gate has two faces and can take the pressure on either side, so that the level of Dock No. 2 may be kept either higher or lower than the main dock at tide time. The caisson gate has three large sluice-ways through it, giving an area of 330 feet. The weight on the sill is regulated by air-chimneys. The sides of the junction-cut have pitched slopes passing under timber jetties, which extend along each side, with gangways from them to the shore. It was originally intended to use two sections of timbering, one to be built in the dry and the other after the dam was removed. But the ground proved to be extremely bad and full of water, want of space rendered it impossible to take out the mud to a flatter slope than 1 to 1 and the proximity to the main dock required the most absolute caution. The section in the dry was not carried towards the main dock as far as it was at first intended, but an intermediate section was decided upon, which was built with the junction-cut flooded to a depth of 16 feet between the dam and the caisson gate. As the pitching and slopes were brought up, the water was raised by means of a 15-inch syphon from the main dock. Dock No. 2 on its completion was also filled by the same means, the water passing through the caisson gate sluices from the junction-cut. The dam next the main dock having been thinned down as far as it was deemed safe, by means of winch handcart bogey roads, the water in the junction-cut was raised to the same level as that in the main dock, and the top of the dam worked off into waggons and dredging started.

INDUSTRIAL CONCILIATION.

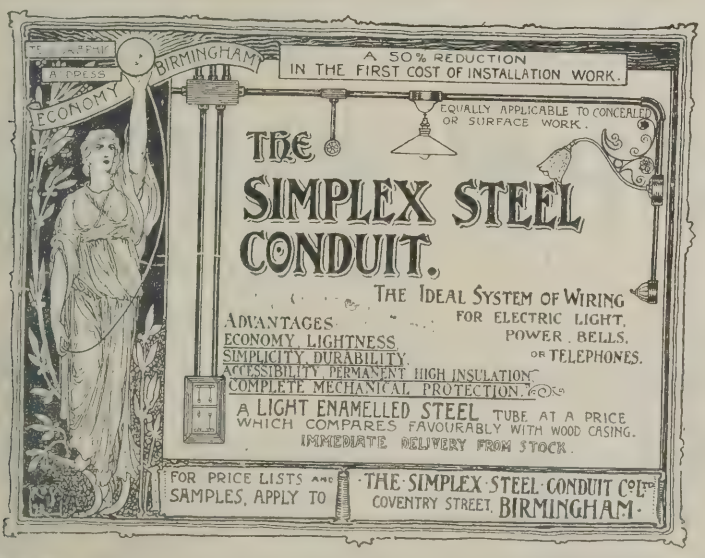
A PAPER was read in the Economic Science and Statistics Section of the British Association by Mr. L. L. Price on "Industrial Conciliation." He referred to a paper read on the same subject when the Association met at Bath in 1888, and reviewed the progress of industrial conciliation during the intervening ten years. At first sight such a retrospect might seem discouraging, for scarcely a year had passed without some conspicuous industrial quarrel; but, on the other hand, public attention had been drawn to the subject, expert ability had been applied to the criticism and discovery of remedies, and experimental knowledge had been gained. Influences prejudicial to industrial peace had unquestionably been recently at work. A tendency on the part of the men to deny plenipotentiary authority of negotiation to their representatives had accompanied, and partly neutralised, an increasing willingness on the part of employers to receive and negotiate with such representatives. This was, perhaps, the fact of most evil omen for the future, and it was connected with deeper phenomena. A spirit of unrest had been abroad in the labour world, both among the new and the older unions. Socialistic aspirations had encouraged large ambitions, and the advocacy, for example, of a "living wage," if interpreted comprehensively, was opposed to some pacific modes of settling industrial quarrels. A reversion to older methods of policy and a resistance to improved machinery and processes of manufacture, especially at a time when foreign competition was becoming more severe, and making more dangerous that tendency to take the business of life more easily, which seemed to be characteristic of the times, was a phenomenon which could hardly be ignored; and it might even be doubted whether public opinion, which was becoming a more potent force in industrial disputes, did not exercise some influence prejudicial to lasting peace. For this public opinion was sometimes ill-informed and often impatient. It was liable to be carried away by such phrases as those of "a living wage" and of "collective bargaining," which required careful discrimination. Public opinion impatiently asked for State intervention, but, in view of some recent circumstances, that demand required very careful consideration; and the experience of New Zealand was not applicable to England, except with large allowances for difference of conditions. Mediation rather than arbitration seemed still the appropriate *rôle* of the State, and the progress of voluntary conciliation and arbitration, though sometimes unnoticed, was not inconsiderable. Two important features in the recent history of voluntary methods deserved notice, the first being the position and prospects of the sliding scale, which had been declining in favour, and the second the growth in prominence and utility of mediation as contrasted with arbitration.

Mr. W. M. Acworth pointed out that Mr. Price had not dealt with the special case of large classes of municipal servants

and servants of public companies; he should be glad if he would tell them how far what he had said applied to those special classes. Then he would have been glad to hear what effect Mr. Price considered free labour had on the relations of organised employers and men.

Mr. H. Wilson desired a definition of what Mr. Price had termed successful arbitration. Was it not possible that a dispute between master and workmen might be brought to an end, and yet very permanent harm done to the industry? Mr. Price had spoken rather tenderly of public opinion; but where, he asked, would they find a person who owed his success in life in the slightest degree to conciliation or arbitration? Any little success any of them might have achieved was due to flying directly in the face of those ideas which were known as "public opinion."

Mr. B. Martin pointed to the very important tendency in the present day towards federation, which led him to anticipate that in a few years' time there would be two great federated organisations face to face, representing capital and labour respectively. He urged that labour disputes should be settled in some authoritative way, in order that the disastrous dislocation of the industries of the country might be avoided.



Professor Gonner, in drawing attention to recent disputes between capital and labour, said he was of opinion that at some point the State must declare that it had interests as distinct from the interests of one side or the other. With regard to public opinion, what economists had to do if they found it exerted ignorantly or injudiciously, was to endeavour to educate it so that it might be exerted aright. The problems to be solved in regard to this question were the particular function which public opinion could fulfil, and the particular ways in which the State could intervene, ultimately compulsorily and certainly always strongly.

Mr. J. R. MacDonald characterised Mr. Price's paper as having too much the aspect of special pleading. He considered the federation of masters of infinitely more importance than the other matters on which special stress had been laid by him. Then another element in the problem was the formation of large limited liability companies, controlled by managers, who did not approach the men with that old-fashioned conscientiousness which the employer used to exercise. With regard to industrial peace, he did not agree with peace at any price; certain principles must be maintained before the conditions of industrial peace could be accepted.

Mr. J. Angell considered it of fundamental importance to the future industrial prosperity of the country that political economy should be taught in primary schools.

Mr. G. H. Wood, speaking as a working man, contended that the principles of political economy were as well known to the working classes as to the middle classes and the manufacturers. The delegates at the recent Trades Union Congress were, he affirmed, unanimously in favour of compulsory industrial arbitration brought about by the State, with power to settle disputes and inflict a penalty on the party which disregarded the award. It was felt, however, by the delegates that this would place another weapon in the hands of employers to defeat the end the working men had in view, though he did not hold that opinion himself. With regard to improved machinery, the working man's objection to it was that it did not directly benefit him; he felt that improved machinery should be used for the benefit of the working man and the inventor, and not the capitalist or employer only.

Mr. Price replied to the various criticisms. While it was quite true that there had been a considerable tendency to the growth of federations, they must set against that the frequency of demarcation disputes, which were most difficult to adjust. They also found masters contending with masters where interests were opposed. There were, he considered, inherent forces at work which, when the federation became very large, would tend to break it up. He did not consider that they would be likely to see all the employers organised in one great federation and all the workmen in another. He was not an advocate of industrial peace at any price, for it was conceivable that there were higher ends in view. With regard to the labour disputes of semi-public servants, he was of opinion that some method of compulsion would have to be applied to settle them. The question of free labour was a very difficult one. He held that on the whole there was less evil when negotiations were conducted between organisations on either side than when they were not, though the incidental consequence might be in some cases the displacement of free labour. Though the whole subject under discussion was beset with difficulties, yet there had been considerable progress in the adjustment of minor disputes. Regarding the interference of the State, unless extreme caution were used it would be found that the State was regulating wages. He was of opinion that there was not much opportunity for the State to do more than it had done by giving publicity and exercising mild persuasion. Public opinion, when educated, was likely to exercise a more potent influence than that exercised by the State.

"THE BANQUET."

THE CABOT TOWER.

THE erection of a lofty tower on Brandon Hill to commemorate the connection of the Cabot family with Bristol was commenced on June 24, 1897. The foundation-stone was laid by the Marquess of Dufferin and Ava, who on the occasion of his visit was enrolled an honorary freeman of the city. The tower was completed a couple of months ago, but it was thought appropriate that the formal opening should be deferred till the visit of the British Association to the city, and the Marquess of Dufferin consented to perform the ceremony. The tower, which has been erected in the centre of the platform upon which the guns captured in the Crimean War stood, is a square structure of ornamental character, adapted from a well-known example in the Department of the Loire, in France. It has buttresses at the angles from base to summit. There are two stages, each of which is relieved with an ornamental balcony, which adds much to the appearance of the tower. The floor of the upper balcony is 75 feet from the base, and above this there is an octagonal spire of 30 feet, making the total height 105 feet. The tower is ascended by means of a circular staircase of good width to the first stage, and above that there is a spiral staircase to the second stage. The style of the design furnished by Mr. W. V. Gough is typical of the style prevalent in England at the time of Henry VII. The spire of freestone is surmounted by a gilded figure mounted on a globe, also gilded. The platform on which the tower is erected is square and is 42 feet across, and at the angles there are epaulments occupied by the Russian trophy guns. From the top of the tower, which is 364 feet above sea level, a magnificent panoramic view can be obtained of Bristol and neighbourhood. At the base of the structure there are panels for the reception of bas-reliefs bearing inscriptions. Over the panel at the main entrance is the Bristol coat of arms, whilst on the east side is the royal coat of arms of Henry VII., under which is a tablet bearing the following inscription :—"This tower was erected by public subscription in the sixty-first year of the reign of Queen Victoria, to commemorate the fourth centenary of the discovery of the continent of North America on June 24, 1497, by John Cabot, who sailed from this port in the Bristol ship *Matthew*, with a Bristol crew, under letters patent granted by King Henry VII. to that navigator and his sons Lewis, Sebastian and Sanctus." On the south side, under the Merchant Venturers' Arms, is a tablet bearing the following inscription :—"This tablet is placed here by the Bristol branch of the Peace Society in the earnest hope that peace and friendship may ever continue between the kindred peoples of this country and America. 'Glory to God in the highest, and on earth peace, goodwill towards men.'—Luke ii. 14." On the west side the panel is surmounted by the coat of arms of Venice. Brass plates have just been affixed to the balustrade of the upper balcony indicating the direction and distances of various cities in England and abroad, and also pointing out the buildings of interest to be seen from the balcony. On the plates, too, are engravings of the buildings mentioned, and also an indication of the height of the balcony, viz. 334 feet above Ordnance Survey datum. Amongst the names of places on the plate on the west side is that of "Canada," which, it is stated, is about 2,400 miles distant, and is the land first seen by Cabot A.D. 1497.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

18942. Andrew Allen, for "Improvements in roofing."

18955. J. W. Thomas, for "Improvements in chimney-pots and the like."

18990. Alfred John Bewick Ward, for "Self-locking flooring blocks, tiles or other blocks."

19035. Albert Lichtenthaeler, for "Improvements in and relating to hollow shafting and ventilating apparatus comprising the same."

19161. Stephen Isaac Adams, for "Improvements in bricks."

19237. Gustav Kruse, for "Improvements relating to the means for joining together stone or earthenware plates or blocks for building purposes."

19251. William Ormrod and John William Wild, for "Improvements in or connected with brickmaking machines."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. 3. Mowing.
2. Harrowing. 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, B
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" t 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. P. Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has be their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extrem moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. P Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of y house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are n ready for issuing.

THE WEEK.

ONE of the signs of the approach of winter, which is not so formidable a season to the student of art as it is to other people, is the card of admission to the lectures of the Royal Academy of Arts. Welcome as it is, a student would be glad if it presented a less stereotyped character. Why must the subjects of the architectural lectures always remain unannounced, as if the peace of the world would be disturbed if they were known? Is it creditable to the Academy to find it stated year after year that "arrangements for the delivery of lectures on sculpture have not yet been made?" The first lecture of the chemistry course will be delivered by Mr. A. H. CHURCH on Monday, October 10. The subjects treated this year are "Grounds for Painting," "Classification, &c., of Pigments," "Selected Palettes," "Vehicles and Varnishes," "Methods of Painting," and "Conservation of Pictures." The lectures on anatomy by Mr. W. ANDERSON commence on October 31, and the demonstrations on November 14. Sir W. B. RICHMOND'S course opens on January 9 in next year. The subjects treated will be as follows:—"Poetic and Realistic Design," "The Art of Sir EDWARD BURNE-JONES," "TINTORETTO and TITIAN," "Style," "Character as represented in Portraiture."

WE congratulate Mr. JOHN BRETT, A.R.A., on the ability displayed by his son Mr. MICHAEL BRETT as a barrister, although the argument employed will raise a fluster in many a council chamber and Local Board office. It related to that *vexato quæstio* the responsibility for the cost of pavements, which has disturbed many a house owner in suburban districts. Mr. JOHN BRETT lives at Wandsworth, and the District Board of Works demanded from him 145*l.* 17*s.* 11*d.* as a share of the expenses for paving Putney Heath Lane. When the case came before Mr. ROSE at the South-Western police-court it was contended by Mr. M. BRETT that the lane was not a new street within the meaning of the Act, and therefore repairable at the expense of the general body of ratepayers. He cited cases showing that the judges had held that in deciding whether a certain thoroughfare was a new street or not, attention should be paid to the general character of the houses in the neighbourhood. With that theory the magistrate concurred. For the District Board it was argued by Mr. YOUNG that if such a conclusion were accepted then it would follow that a road lined with small houses could be called a street, while a road sparsely lined with large houses of rental of over 100*l.* a year could not be termed a street. The Board would have to wait till the gaps between the large houses were filled before calling on the owners to pay for the paving. That was a serious affair for the authorities. Mr. YOUNG asked to be allowed to withdraw the summons, but, on the application of Mr. BRETT, the magistrate declined, and the summons was dismissed on a question of fact. Many sufferers who have been mulcted in charges for paving will regret that a similar point was not raised in their cases; but how are authorities to meet the difficulty of paving roads like Putney Heath Lane? The general body of ratepayers are opposed to paying expenses which are supposed to be mainly for the benefit of individuals.

THE Church Congress this year is engrossed with the discussion of subjects that are in a measure connected with art, although few would care to admit the fact. But architecture has contrived to show its power. The Rev. Dr. JESSOPP, who is a most genial writer on church history, read a paper on the relations of clergy and laity. His theory was that originally the laity bore their part in the government and the management of the churches. But gradually the clergy gained the upper hand, and in councils and synods of the third century the laity were indeed allowed to be present, but merely on sufferance or little more. The architectural history of the earliest churches, said Dr. JESSOPP, afforded interesting evidence of the steady growth of exclusiveness. The clergy were continually gaining ground, as against the laity, and the laity were continually losing it. Perhaps the most noticeable of all the architectural changes was the development of the early lattice work (cancelli), which divided the Holy Table from the too near approach of the laity, into those beautiful chancel screens, which were the delight and admiration of all lovers of art. He sometimes wondered that, upon these same beautiful screens, with their gates and doors all duly closed against the common folk, there never was inscribed the pagan warning, *Procul, o procul este profani!* The question of chancel screens is one which has caused much controversy, and there can be no doubt that in some countries the screen was protective rather than symbolic. Another point touched was the influence of Rome in the earliest conversion of England. That is an important problem, for it comprises the question of the origin of primitive churches, and especially whether they were derived from a Roman type. The Bishop of BRISTOL, who is learned in archæology, said that the whole of England, with the exception of Kent, was converted from Northumbria. In that case the original Christian churches would be probably derived from Anglo-Saxon buildings; but Professor COLLINS, who followed him, said the English Church began in Kent, not in Northumbria, and he spoke of PAULINUS'S church at York as if it were an important building. When two authorities differ so much it becomes extremely difficult to write a history of English ecclesiastical architecture.

AT a conference of municipal engineers held in connection with the Sanitary Institute on Wednesday, Mr. DE COURCY MEADE, who presided, explained the measures taken by the Corporation to provide dwellings at a reasonable rent for the working classes in Manchester. There had been erected, he said, on the cleared sites (*a*) blocks of five-storey tenements approached by a common stairs and balconies; (*b*) blocks of tenements of two and three storeys, with separate entrance and stairs to each set of tenements; (*c*) terrace cottages of five rooms each; and (*d*) a model lodging-house. Drawings of the buildings were exhibited. The Manchester Corporation were also erecting (*e*) cottage dwellings in the outskirts of the city, about 2½ miles from the cleared areas, where land was less costly; these cottages varied somewhat in character, and contained from five to seven rooms each. The buildings class (*a*) had been occupied about three years, and were let at rents which yielded a moderate return upon the cost of erection. The two blocks (*a*) of five-storey buildings cost about 87,000*l.*, exclusive of the cost of sites. The latter, with old buildings thereon, cost about 54,000*l.* Single-room tenements were let at 2*s.* 6*d.* per week; the rent of two or three-roomed tenements varied from 3*s.* to 5*s.* per week. In addition to these new buildings, much had been done in the improvement of existing dwellings, and the conversion of "back-to-back" houses into "through" houses. This work, though excellent where it was effected, had a tendency to cause overcrowding elsewhere, as the number of persons that could be accommodated in the converted and improved dwellings was much less than was crowded into the "back-to-back" houses before alteration. A paper was read by Dr. F. J. SYKES before the conference of municipal representatives, in which he said that the cubic space per head in dwellings was the most difficult point of all to deal with in practice, and must be regarded sanitarily as the most important. Calculated on a physiological basis, the requirement for the human adult was 10,080 cubic feet. We were continually bemoaning the large death-roll of consumption, or tubercular phthisis, essentially a disease spread by crowding, and the medical profession was now strongly advocating the cure and mitigation of the disease by fresh-air treatment. Was it out of place to advocate even more strenuously the prevention of the disease by fresh air, by the provision of more cubic space, and especially by raising the present inadequate minimum standard? The minimum standard should be advanced to 400 cubic feet at the very least. Dr. SYKES said that to erect and certify buildings was one thing, to prevent them from being used other than in the manner intended was quite another thing, and they were living in a fool's paradise if they thought that they were going to succeed in providing the working classes with more breathing-space without having the means of preventing it being compressed to its original proportions.

SIXTEENTH-CENTURY CONTRACTS.

IF we take the agreements entered into for the vaulting and other works at King's College Chapel, Cambridge, as examples of the contract deeds in use in the early part of the sixteenth century, we cannot fail to be struck with their simplicity, especially if we compare them with the documents which serve a similar purpose for less important works that are signed, sealed and delivered every day throughout England. In deeds which bound the provost and scholars of the college, and to which the young Harry the Eighth was indirectly a party—for the authorities on one side were described as acting on the advice and agreement of Thomas Larke, the surveyor of the king's works at the college—there was little possibility of careless draughting. The lawyers employed would endeavour to provide against every contingency as is done in our day. Moreover, the correspondence between the various contracts suggests that the form employed as a basis was one which was accepted as having conformity to usage, for the old lawyers were well aware of the advantage which arises from the avoidance of the use of terms and clauses which were not familiar to any of the parties. We may therefore presume that the contractors, John Wastell, master mason, and Harry Severick, one of Wastell's wardens, who were the other parties to the indenture, could not in case of dispute plead that they were deceived by phraseology that was indefinite.

Wastell and Severick agreed in 1512 to make and set up, or cause to be made and set up, at their costs and charges, a good, sure and sufficient vault for the great church. It was to be workmanly wrought, made and set up after the best handling and form of good workmanship. Although the modern vocabulary is more extensive it is still difficult to define the quality of work with precision by means of words alone, and after all, the brief specification expresses what is desirable as well as a more copious phraseology. The work was to be carried out according to a plan signed by the executors of Henry VII.

The contractors next agreed to provide and find at their cost and charges as much good, sufficient, able stone from the Weldon quarries as should suffice for the vault. They were also to supply lime, sound scaffolding, moulds and every other thing required or necessary, as well as workmen and labourers.

The timber for the scaffolding was to be supplied to the contractors, and apparently was not constructed upon the part of the chapel which was to be vaulted. This seems plain when we find it was agreed that the contractors were on the conclusion of the work to have the timber of two of the "severeyes" or compartments for their own use and profit, as a recompense for "the great cost and charge they shall be at in removing the great scaffold there." It is also worth noting that plant and tools were lent to the contractors, which they were to return to the college authorities when the vaulting was finished. The period allowed for the work was three years, reckoning from the day when the works were commenced.

The total amount to be paid for the vaulting was 1,200*l.*, or at the rate of 100*l.* per severey. The money was to be advanced in such sums as would be sufficient to pay the masons and other workmen, and also to settle the bargains for stone. The accounts for each severey were to be settled before the next was commenced. The surplusage remaining after the payments for wages and materials was to be handed over to Wastell and Severick.

It will be observed that the contractors were restrained with a tight hand. The vaulting was to be executed in portions which allowed of the closest superintendence by Master Thomas Larke, the king's surveyor. The accounts for stone would aid in enabling him to ascertain that the quality was kept up to the original standard. The wages bills would show whether there was any diminution in the number of competent or free-masons. Simple and brief as was the deed, it was sufficient to insure the production of a roof beneath which, according to the legend, Sir Christopher Wren was puzzled, and professed his inability to construct a rival work.

Another contract of 1513, in which John Wastell alone appears as contractor, relates to the construction and erection of twenty-one finials for the buttresses of the chapel or "grete churche." The quality of the work was described in terms similar to those used in the foregoing contract. The finials were to be according to plans conceived and made for the purpose, and to correspond with a finial which already existed. But it was stipulated that all the new finials were not to be exactly alike in their dimensions; some were to be larger, and the contractor was to follow the special moulds or models made for them. He was also to construct a tower at one of the corners of the church in the position which the surveyor, Master Larke, would assign, and from a plan in the surveyor's possession. The stone used was to be derived from the Weldon quarries. The contractor was to be lent old scaffolding timber as well as plant, which were to be delivered up on the completion of the buttresses and tower. The price to be paid was 6*l.* 13*s.* 4*d.* a finial, or 140*l.* for the twenty-one, with 100*l.* for the tower.

In this contract it was stipulated that sixty free-masons were to be constantly employed. In order to secure them the surveyor was to furnish John Wastell with a commission by which they could be taken from other employment. In case any of the masons or labourers happened to be unprofitable, or by his evil demeanour hindered the progress of the operations, then the surveyor was to endeavour to have the work performed "by such ways as hath been there used before," which we suppose means that despotic action became allowable. The provost, scholars and surveyor, for Master Larke appears prominently as a party to this contract, were to furnish five shillings' worth of iron for each buttress. If more iron was required, John Wastell was to obtain it at his own cost and charge. Finally, the contractor bound himself, his heirs and executors in the sum of 300*l.* of good and lawful money of England, and the provost, scholars and surveyor bound themselves in a like sum to carry out all the covenants.

A third contract relating to King's College Chapel was entered into with John Wastell in 1514. The work to be executed was vaulting. In two porches Yorkshire stone from Hampole quarries was to be used: in seven side chapels and nine chapels behind the choir the favourite Weldon stone was to be again used. For the work forty free-masons were to be kept continually. The amount to be paid was 25*l.* for the vaulting of each porch, 20*l.* each for the chapels in the body of the church, and for the nine chapels behind the choir, which were to be of coarser work, 12*l.* each. In addition, for the battlements 100*l.* was to be allowed.

There are two contracts for the stained-glass windows. On one side, in addition to the provost of King's College, who at the time was Robert Haccombleyn, were found William Holgylle, the clerk, master of the Hospital of St. John Baptist, called the Savoy beside London, and Thomas Larke, who was advanced from the surveyorship to be archdeacon of Norwich—or rather he was allowed to hold both offices, a survival of the old combination of technical and ecclesiastical duties which William of Wykeham made famous. On the other side we find Francis Wylliamson, of the parish of St. Olave, Southwark, and Symond Symondes, of the parish of St. Margaret, Westminster, glaziers. The latter party agreed, at their own proper costs and charges, "well, surely, cleanly, workmanly, substantially, curiously and sufficiently to glaze and set up, or cause to be glazed and set up, four windows on the one side of the said church and two windows on the other side, with good, clean, sure and perfect glass and orient colours, and imagery of the story of the Old Law and of the New Law after the form, manner, goodness, curiosity and cleanliness in every point of the glass windows of the king's new chapel at Westminster, and also according and after such manner as one Barnard Fflower, glazier, lately deceased, by indenture stood bound to do, and according to such patterns as shall be delivered for to form glass and make the aforesaid four windows." Two of the windows were to be set up within two years, and the remaining four within the three years that followed, "without any further or longer delay." The glaziers bound themselves to "strongly and surely bind the windows with double bands of lead for defence of great winds and other outrageous weathers." The price to be paid was sixteen-pence sterling per foot. The artists were probably not men of substance, for they were compelled to obtain as sureties John à More, esquire, John Kellet,

yeoman, GARRARD MOYNES, joiner, HENRY JOHNSON, cordwainer, who agreed to be bound in 200*l.* that the contract would be duly carried on.

The second contract was with the following glaziers, viz. GALYON HOONE, of the parish of St. Mary Magdalen, Southwark; RICHARD BOWNDE, of St. Clement Danes; THOMAS REVE, of St. Sepulchre's; and JAMES NYCHOLSON, of St. Thomas Spyttell, Southwark. They were to glaze and set up eighteen windows, including the east and west windows, under similar conditions to those of the preceding contract, the king's new chapel at Westminster being the standard. They were also to set up any glass which was prepared by others, and to bind it with double bands of lead, the price for this work being twopence a foot. For their own glass they were to receive twenty-pence a foot. GALYON & Co. were evidently more skilful designers than WYLLIAMSON and SYMONDES, for they agreed to supply good and true patterns, for which WYLLIAMSON and SYMONDES were to pay such sums as Masters WILLIAM HOLGYLLE and THOMAS LARKE considered reasonable. GALYON & Co. bound themselves to lodge 500 marks as security.

From the contract it is manifest that in the beginning of the fifteenth century in England glass painters did not always follow their own designs. The arrangement about the preparing designs for WYLLIAMSON and SYMONDES is sufficient evidence. But the introduction of the name of BARNARD FFLOWER also suggests that the imitation of the style of an artist who was no longer living was sometimes made obligatory. If we knew more about the arrangements which were followed at the time, we might discover that the beginning of the sixteenth century and the end of the nineteenth century were much alike in adopting the division of labour as an aid to economical and expeditious execution.

Fortunately the windows have survived the vandalism which was successful elsewhere, and has deprived so much Gothic masonry of the colouring which was intended to be a foil to the severity which is unavoidable with work in stone. Still, as the poet says :—

> While from our sight
> With gradual stealth the lateral windows hide
> Their portraitures, their stonework glimmers, dyed
> In the soft chequerings of a sleepy light.

It is also clear that for the proper execution of masons' work more reliance was placed on the surveyor's superintendence than on a specification of portentous length. The masonry was to be well and workmanly wrought, made and set up after the best handling and form of good workmanship according to the plans, and whether that was the case rested on the testimony of the surveyor. If he found the men were not working properly he was able to correct them "by such ways as hath been there used before," for in a building in which HARRY THE EIGHTH was interested, an occasional interference with the liberty of the subject would be tolerated.

Apart from their interest as legal documents, the contract deeds are evidence that the popular belief about the vaulting being a work of HENRY VI. is erroneous. WORDSWORTH commands us to

> Tax not the royal Saint with vain expense,
> With ill-matched aims the Architect who planned—
> Albeit labouring for a scanty band
> Of white-robed scholars only—this immense
> And glorious work of fine intelligence.
> . . . that branching roof
> Self-poised, and scooped into ten thousand cells,
> Where light and shade repose, where music dwells
> Lingering—and wandering on as loth to die.

The plans for the vaulting were prepared in the reign of HENRY VII., and were realised in the beginning of the reign of HENRY VIII. The excellence of the work reveals that the skill of the Mediæval masons had not altogether died out in England, for, as M. VITET says, when speaking of King's College Chapel :—"Le luxe de la décoration des voûtes ne peut pas être poussé plus loin."

The Next Ordinary Meeting of the Society of Engineers will be held at the Royal United Service Institution, Whitehall, on Monday next, October 3, when a paper will be read on "Protective Metallic Coatings for Iron and Steel," by Mr. Sherard Cowper-Coles.

THE CENTENARY OF LITHOGRAPHY.

THE centenary exhibition of lithographic art, which was to be held at the Society of Arts, will, according to the official announcement, have a less central position. Some of the dismal structures on the west side of the Exhibition Road at South Kensington have been assigned to it. Lithographs will there be out of place. The Lords of the Committee of Council have never done one act to foster the art, whilst the Society of Arts from time to time endeavoured to inform the public about its advantages. Excellent examples of the art were produced to illustrate some of the papers read in John Street, Adelphi. Moreover, the revelations about the mismanagement at South Kensington cannot be encouraging to collectors. Taking all things into account, we do not anticipate that the exhibition, which is to open about November 1, and will not be closed for four months, is likely to do much towards the revival of an art which has many of the advantages of etching in its favour, and is suitable for uses where etching would be out of place.

Like many other discoveries which were valuable to the world, lithography owes its origin to an accident. ALOYS SENEFELDER, whose name is inseparably connected with the process, was the son of an actor in the Munich Theatre. The lad wished to follow his father's example, but actors rarely are pleased to see their children on the stage. ALOYS was sent to the University of Ingolstadt to study law, but he cared more for amateur performances in which he took part and for attempts at playwriting. He was unable to pay for printing one of his plays, and he tried to discover some substitute for type. Copying the manuscript on copper-plates with an etching needle appeared the most feasible means, but the expense of the plates was a drawback. In order to be economical, he practised writing backwards on a piece of Kellheim stone or flag. As an amateur he was ignorant of the usual way of preparing the ground for an etching on copper. He tried a composition of wax and soap with lampblack. One day ALOYS had to make out an inventory for his laundress, and as paper was not at hand he scribbled the items with the composition on his Kellheim stone, intending to copy them afterwards on paper. The stuff hardened, and as he had already made experiments in stereotyping, he concluded that if he could obtain sufficient relief, copies of the inventory might be produced. By means of an acid he was able to act on the calcareous stone, and the principle of lithography might then be considered as discovered.

Lithography is a simple example of chemical attraction and repulsion. Lines, letters or figures which are drawn by greasy ink will be increased in height if more of the same kind of ink be rubbed over them. On the other hand, they will repel water or acid. Speaking generally, the process consists, first, in drawing on a calcareous stone with prepared ink; secondly, in bringing the inked parts into relief by adding infinitesimal layers of ink by means of a roller, and by depressing the other parts with the aid of an acid. In that way the stone may be considered as having some analogy with a forme of type or with a woodcut. But a relief made of greasy ink has not the endurance of metal type or of boxwood. If printing-ink were applied to the stone with the expedition that is usual in typography the parts which are drawn would be quickly obliterated, and a black surface varying in density would be the only result. By damping the stone with water, which is repelled by those parts alone which are drawn, it is feasible to apply the inked roller over the whole surface, for the ink will amalgamate only with the drawing, and will be repelled by the damp portion. There is constantly an operation of mutual attraction and repulsion in progress as long as prints are taken from the stone.

The whole process appears very simple now, but SENEFELDER could only develop it by slow degrees. It was easy enough to take a copy of a washerwoman's inventory by pressing paper with the hand over the stone, but when a large amount of work had to be printed off more force was needed. SENEFELDER was obliged to treat printing as if it were pile-driving, by allowing a weight to fall from a height in order to press the paper closely to the stone. But that method was not only cumbrous, slow and costly; as uniform pressure was uncertain prints were sure to be irregular in appearance.

The earliest examples were defective if tested by the standard which was subsequently attained. It appeared then as if the new art was best adapted to become a rival of typography. A greater variety of letters could be produced than the typefounder was able to cast, and it became easy to make facsimiles of manuscripts. The Germans give more attention to ornamental writing than we do in England, and lithography enabled addresses, title-pages, diplomas, &c., to be executed in large numbers on economical terms. The art was also found to be adapted for plans and diagrams. But the early pictorial subjects could not be considered as successful. The reason was that so long as polished stones were used monotony was inevitable. When it was found that by rubbing one stone with another, a layer of sand intervening between them, a "grain" varying in coarseness could be obtained at will, then the gradation needed for pictorial effect was available. Chalk drawings were easily imitated.

Some artists have almost instinctively recognised the resources of the art. SAMUEL PROUT was not considered by JOHN BRITTON as competent to assist in making drawings for the "Cathedrals" and other publications. The artist's style was not adapted for copper-plates. But PROUT's lithographs of continental cities are more effective than BRITTON's plates. The copies which were made by engravers on steel from PROUT's drawings for the "Annuals" have not a tithe of the "go" we see in his own lithographs. LOUIS HAGHE's work is more elaborate, for he was a trained lithographer, but it does not suggest the power of seizing characteristics at a glance which is so manifest with PROUT's plates. "H. B." DOYLE's caricatures correspond with PROUT's, for there is rarely any appearance of working up to gain effect. A similar spirit inspired the majority of the French artists who devoted themselves to original compositions on stone. GAVARNI's lithographs appear to represent phenomena that varied with the hours. RAFFET and CHARLET suggested the whimsicalities of French politics, the public opinion which is scarcely formed when it vanishes, the loyalty which is only a step to hate, with an expedition which no journalist could match. DELACROIX found he was under less restraint when drawing on stone than when painting, and the artist is not to be comprehended if we exclude his lithographs from our purview. Many others could be mentioned who have gained success from understanding that lithography is an art *per se*, and must not be confounded with etching or other modes of representation in black and white. Not that elaborate effects are excluded. There are plates by DECAMPS which rival his works in oils, although deprived of his luminous colouring.

To Germany we are indebted for the art, and the artists have toiled as if they alone were entitled to supply the world with plates. If statistics were forthcoming, it would probably be found that during the century more lithographs were issued in Germany than in the other parts of Europe. German work is commonly most conscientious, and therefore the copies of pictures in public galleries are in accuracy almost equal to photographs, while possessing some slight traces of the draughtsman's individuality; but in a collection of German lithographs we rarely can discern the sparkle and life which are found in French work, although it may be no more than a copy.

In both Germany and France lithographs are still published for which a high but reasonable price is demanded. With us costly plates are unknown. In middle-class houses lithographs are rarely seen on the walls. The art is supposed to be adapted for trade purposes alone. It is superseded now by etching, photography and various reproductive processes. If the coming exhibition will convince people that lithography is not unworthy the attention of able painters and of the public, any expenditure which may be necessary will not be grudged. But preceding exhibitions which were also opened under the auspices of the Science and Art Department do not warrant an expectation of attaining so satisfactory an end.

The First Ordinary Meeting of the Liverpool Architectural Society (fifty-first session, 1898-99) will be held at the New Law Library, 41 Castle Street, on Monday next, October 3, at 6 P.M.

SOUTHWELL MINSTER.

THE report presented by Mr. Street to the Bishop of Lincoln, and which we reprinted last week, satisfied neither the friends nor the foes of restoration. Several letters on the subject were addressed to *The Architect*. In the first place, we were asked by the Society for the Protection of Ancient Buildings to publish a copy of a remonstrance addressed to Mr. Street. It ran as follows:—

To G. E. Street, Esq., R.A.

Dear Sir,—The committee of the "Society for the Protection of Ancient Buildings" takes the first opportunity of replying to your letter of September 16, addressed to the Society through its hon. secretary, and of referring also to a letter which you addressed to *The Architect* on the same subject. It will be convenient to make this a reply to both, by sending a copy to the editor for publication.

In your letter to the hon. secretary you complain that the Society should have accused you of advising the removal of the fourteenth-century screen, and in your letter to *The Architect* you say Mr. Morris's statement (on this point) is "exactly the reverse of the fact." The committee may be allowed at once to express surprise at both these objections, since it did not repeat the common assertion without believing there were good grounds for accepting it. The proposal to remove the screen was commonly spoken of wherever the "restoration" of Southwell was discussed, and your name was so unreservedly connected with it, especially at Southwell, where our inquiries were chiefly made, that the committee could not think it was doing you any injustice in repeating the common report. The following were some of the more public statements:—In a letter to the *Times* Canon Venables said, after describing the difficulty of adapting the church to its new conditions, "There are several solutions of the problem proposed by distinguished members of the architectural profession;" and he places this first—"To cut the knot boldly by pulling down the choir screen." This letter produced a reply from you, in which you acknowledged that it seemed to have been written in consequence, to some extent, of the report you had made. The severest remarks in Canon Venables's letter were directed against the proposal to remove the screen, and your reply appeared to be addressed more particularly to them when you said, "So far from regarding my proposals as outrageous, I confess I prided myself on the common-sense character which marked them." You certainly speak here of more than one proposal, and the reference is clearly to that which had excited most opposition.

The committee would refer you next to an article in the *Evening Standard*, December 1877, which says, "The choir screen is not to be removed as reported, its detention having been unanimously decided on at a recent chapter." If this article were "communicated," as it may well have been, it would be proof that the bishop and clergy of Lincoln were under the impression that your proposal to remove the screen was a serious one, and the committee might be excused for adopting an opinion founded on their authority. Still, after receiving your letter of September 16, it would have been bound to withdraw the statement, though it was given only as an "understanding," and, as shown above, founded on reasonable assumption, if you had not yourself, by the publication of the report, given the committee the only confirmation that was needed. After reading this report the committee must frankly say it cannot see in what respect its statement is inaccurate. Among the proposals you there make this is the one that, if not most directly recommended, is more frequently suggested than any other. It is needless to quote the passages, since the report has been so recently published, but the committee may point out how curiously the editor of *The Architect* confirms the Bishop's reading, though he had your disclaimer before him to guide his opinion. He says:—"If the screen be no longer useful, if its removal indeed would be a convenience, and at the same time lead back to the original arrangements of the church," he would "go with you" in removing it. Again, "If it comes to marring the true ancient test of the fabric at large, or sacrificing the less ancient interpolations (meaning the screen), you would let the interpolations go." This is his summary of your doctrine. He clearly thinks that the drift of your report involved the removal of the screen, and that the Bishop thought so is proved by the formal discussion in chapter. The Society cannot be too thankful that this suggestion was not adopted. Acknowledging all the inconvenience it may cause, it thinks the question of removing it or not should never have been raised. These old buildings, monuments of the ancient art and faith of the people, are not the peculiar property of those who at any time happen to have them in charge. A modern congregation in one of our ancient churches is bound to submit to some inconvenience rather than disturb features which are historical or characteristic. You will agree so far with the Society in this opinion as to regret the many unnecessary changes that suggestive congregations have made in old churches. But for the indulgence of passing fancies the ancient altar might now be standing in

the choir of Southwell, and a bishop's throne would have awaited the consecration of the first bishop. Both altar and throne were removed as useless encumbrances by the authorities of the day, and we now find that the choir was not better fitted for the performance of divine service by the change. It would be a matter of future regret if this last revolution at Southwell should have deprived the choir of its only remaining piece of ancient furniture. As you have challenged the Society on the question of the right conservation of these buildings the committee have made these remarks. You see that there is a radical difference between us as to the proper treatment of an ancient monument. The Society cannot recognise any semblance of conservation in the removal of existing features to make way for conjectural reproductions of others that have been left. It thinks the true conservatism and the safer course is to maintain whatever is substantial and historical, even though its proper use may for a time have passed away. In stating these opinions the committee asks leave to point to another part of your report for the illustration it gives of the possibility there often is of accommodating seemingly unsuitable buildings to our wants, if the wish to do so be strong enough. Your recommendation that the obstructive screen should be used as a singing gallery and orchestra when a large congregation assembles in the nave is so rational that we are sorry it should have been weakened by the companionship of any alternative.

In conclusion, the committee disclaims any intention of making statements meant to be "damaging," and regrets you should be under the impression that you have been unfairly treated. In the matter under discussion it does not think it went beyond the limits of warrantable assumption; but if you can show that you have received unfair treatment at its hands it would be anxious to offer you ample apology in any form you could suggest.

Signed, on behalf of the Society for the Protection of Ancient Buildings,

T. NEWMAN MARKS, Secretary.

9 Buckingham Street, Strand, W.C.:
October 25, 1879.

To the epistle Mr. Street sent the following reply:—

Sir,—I have but just received your long letter of October 25, and though I hardly know whether to be most amazed or amused at its contents, I suppose I must answer it at length, as it is not likely that those who read it will have before them the correspondence in the *Times* of September 1876, to which you pretend to refer, even if they are able to refer to my own words in my letter to the Bishop of Lincoln, printed in *The Architect* about the beginning of last October.

Mr. Morris's statement was that I "advised the removal of the fourteenth-century screen." Having in my letter to the Bishop advised that it should not be removed, having never given any other advice, and having at some length defended that advice and none other in the correspondence with Canon Venables in the *Times* of September 1876, I was surprised at the charge, and expressed my surprise to Mr. Morris.

Your letter is the formal justification on behalf of your Society of Mr. Morris's statement.

Instead of dealing with what I have myself written, you refer to "common report." Canon Venables wrote that there were several solutions of the problem suggested by "distinguished members of the architectural profession." He describes these contradictory proposals. One he says was "to pull down the choir screen;" another was "to retain the screen and to use it as an orchestral gallery for the choir." This letter of his, as you say, produced a reply from me, and in the full trust that no one would be able to refer to my reply, you describe it as being a general defence of my proposals, and assert that what I was more particularly defending was the removal of the screen, and that my letter evidently referred to this proposal. Now it is clear from the one or two sentences of this correspondence quoted by you that you must have had it before you when you wrote your letter. I am sorry that this should be the case, for, incredible as it may seem, it is the fact that in my letter in reply to Canon Venables there is not one word from the beginning to the end of it in favour of the removal of the screen. My whole argument was an elaborate one in defence of its retention and use. Canon Venables referred to the opposing schemes of "several distinguished architects." One of these schemes was mine, and I defended it. And I should have thought that the mere fact that I elaborately argued for the retention of the screen would have made it clear even to your Society that I could not at the same time have recommended its removal. Indeed, it is vexatious to have to refute such evident nonsense. The following extracts from the letter which I wrote to the *Times*, in which you say I advocated the removal of the screen, will, I hope, be clear enough. "When I was at Southwell I had the pleasure of opening and discovering the two staircases which lead to the gallery over the screen, and which, as Canon Venables knows, were not built to lead to an organ. I looked at this question with the greatest desire to suggest no departure from old arrangements, if they could possibly be harmonised with modern requirements, and in spite of Canon Venables's statement that it seems incredible that any one should gravely propose to convert this gallery into a singing gallery, I have no hesitation whatever in allowing that I did so, and for the simple and common-sense reason that the screen was originally erected for that purpose, and that purpose almost only." I went on to explain that, with the altar restored to its old place, and with the screen retained and utilised, "the laity may then be placed in the nave, where also will be the pulpit and the lectern; while the Epistle and Gospel will be said again as of old from the gallery over the screen. Not one single feature of the old arrangement will be tampered with in any way, and every portion of the building will be used just as it was intended to be used by the builders who so grandly fashioned it for us." And after protesting against Canon Venables's proposals as being "destructive to the internal perspective of the nave, which has never been tampered with," I finished my letter by the following sentence, out of which you have picked a few words, under the impression (I must suppose) that no one would know what a false impression they produced. "So far from regarding my proposals for this church as being so outrageous as Canon Venables considers them, I confess I prided myself on the common-sense character which marked them almost as much as upon the fact that they involved no alteration whatever in the fabric, while they restored every part of the church to its proper and original arrangement and use, in entire harmony with the simple and usual order of our English church service."

The proposal for the removal of the screen was not made, could not have been made, by one who wrote in this way. It was, I presume, the recommendation of some very "distinguished architect," and not one word was said about it in the correspondence with Canon Venables, in which, nevertheless, you assert that it was clearly this scheme which I was defending. On October 12, 1876, Canon Venables answered my letter in the *Times*. He said of course not one word in support of your hypothesis that I was really proposing the removal of a feature when I was showing how it might be preserved and used; but he wrote as follows:—"I may be permitted to say, with regard to the stone screen between the nave and the choir, that I am well aware that Mr. Street has to a certain extent Mediæval precedent for the use to which he proposes to put it as a singing gallery." My reply to this letter closed the correspondence, and was printed in the *Times* of October 17, 1876. This is what I said:—"What I desired was, to try whether by using the church without any such novel arrangements," as Canon Venables proposed, "we could not make it suit all our purposes just as well as it suited those of its builders." I went on to point out that the Mediæval practice was a dangerous authority for the Canon to quote, for if Mediæval architects had been told that it was necessary to keep a high screen they would have refused to acknowledge the necessity, and would have done as seemed best to them. As, however, they did not remove the screen, "we have, on archæological grounds, to submit to the inconvenience with the best grace we can; and the best mode of doing this is to restore the screen, as far as possible, to the use for which Canon Venables admits that it was erected. If the whole of my recommendations to the Bishop of Lincoln were followed, Southwell Minster would be about as conveniently arranged a church as any in England." "On Sunday the congregation at Matins and Evensong might all be seated in the nave, in full sight of pulpit, lectern, and litany desk, on the nave floor, and of the choir men and boys in the singing loft over the screen, who would be equally well heard," &c. "In this way every part of the church would be used as it was intended by its builders to be used; and seeing how entirely our Anglican services are founded upon those pre-Reformation services for which the church was built nothing is more natural than this should be both possible and convenient." I concluded the correspondence with these words:—"My scheme for using the old choir screen is slightly too bold, and (apparently) too novel for 'safe' people to follow. But a little more courage in dealing with such questions would often save us from the perpetration of schemes for which our successors will not thank us."

I think these extracts are sufficient evidence of the animus which can lead you to represent them as proving that I recommended the removal of the screen. In my report to the Bishop—which having been recently printed can be referred to—I pointed out at considerable length why and how the old rood-screen should be preserved and used. Having done this I told him that there were other possible courses which I much doubted whether he would like to be responsible for. One of these possible courses was the removal of the screen. On this my words were, "Therefore I do not recommend the removal of the old screen," though I thought and still think even that would be preferable to a third course, which I described at length, which it is not necessary now to describe. In a few words, it is sufficient to conclude by saying that I am not responsible for what the editor of the *Evening Standard* or of *The Architect* may have said or thought. But I observe one

the curious fact that there is no evidence in anything that you adduce that anyone even supposed that I had advised the removal of the screen. The chapter, you say, had the proposal before them. But it was no proposal of mine ; my sole connection with the whole business was the giving a letter of advice to the Bishop of Lincoln. This was, I believe, never published in any way till your misrepresentation of its contents obliged me to print it. I am not the architect of Southwell Minster, and have never made any plans for its alteration. I have only done my best to prevent any destruction of any of its old features, and as the old screen seemed to me to be in some risk of being destroyed I devoted myself especially to proving that there was no reason whatever for getting rid of it, and that it might, if people would but have some common sense and no prejudice, very well be made useful for modern service just as it was for those for which it was built.

Indeed, the charge you make against me reminds me of a paragraph in *Truth*, in which the editor expressed a pious hope that "London Bridge will not be rendered hideous by Mr. Street's plan to widen it by facing the present granite arches with iron arches." I have done my best to prevent any removal of any old feature, including the screen in Southwell, and your Society calmly asserts that I have advised the screen's removal. I write to Mr. Morris, telling him how completely he is mistaken, and he replies that he will inquire into the facts. I then publish my report, with a reiteration of my opinion that the screen ought not to be touched, and then I receive your elaborate statement of your reasons for believing that, in spite of my statement and my report to the contrary, I did nevertheless recommend the exactly opposite course to that which I supposed and said I had been taking. Truly on one side or the other words are used to disguise the facts, and the world must judge between us.—I am, your obedient servant,

GEORGE EDMUND STREET.

14 Cavendish Place, W. : November 3, 1879.
T. Newman Marks, Esq., Secretary.

Another letter from the Society followed :—

Sir,—I beg leave, on behalf of the Society for the Protection of Ancient Buildings, to make a few remarks on Mr. Street's letter printed in your issue of the 18th ultimo.

The Society gladly acknowledges that the proposal to remove the screen was not Mr. Street's favourite plan, and inasmuch as it was not his favourite plan it regrets that any expression it has used should have led to the conclusion that it was ; but after carefully reading his letter the committee does not find in it any proof that the other plan was not also put forth by him.

The letter to the Bishop of Lincoln is distinctly a "letter of advice," and is supposed to deal with practical questions or with questions that might become so. When, therefore, Mr. Street says he should not object to be responsible for the removal of the screen, were he not of opinion it might be utilised as it stands, he clearly advises the Bishop, if he cannot adopt Mr. Street's opinion of the usefulness of the screen, to remove it.

That the Bishop could not accept Mr. Street's plan for utilising the screen is not surprising to those who consider the difficulties of a Bishop's position between the contending ecclesiastical parties of the day. If the Society may venture to use Mr. Street's words, the plan was too bold and too novel for safe people to follow. It was then but natural that the Bishop and chapter should turn to the alternative plan as the practical one and discuss that.

If the discussion was more than Mr. Street intended, he may at least be said to have anticipated it when he provided the Bishop with so many arguments in support of the plan discussed. The committee cannot but think, on this point, that all misconception might have been avoided by much simpler means. It regrets the discussion was for a moment raised, even though the plan was condemned. That such a plan should have been even suggested, still more that it should have appeared under the sanction of Mr. Street's name, is, in the opinion of the Society, a misfortune greater that it can express. This proposal sustained by his authority will be a continual encouragement to those who are but too ready to pull about our ancient buildings for any fancied necessity of the day, while it must make the task of this Society more difficult.

Signed, on behalf of the Society for the Protection of Ancient Buildings, NEWMAN MARKS, Secretary.

9 Buckingham Street, Strand, W.C. ;
November 13, 1879.

Mr. Christian, the architect for the restoration, was absent from England during the controversy, but on his return he wrote us the following letter :—

8A Whitehall Place, London :
November 15, 1879.

Sir,—Having taken this year rather a longer holiday than usual for the purpose of visiting a portion of Canada and the United States of America, I have been blissfully ignorant of the correspondence in your columns, in which, from August 30 onwards, my name has so often appeared. With one exception, I have not much to complain of in what has been written on either side, and as my reply to the memorial from the Society for the Protection of Ancient Buildings to the Ecclesiastical Commissioners has been given in full, I have but little to add as regards that Society's action. I would only further observe that had I not cleared away the modern galleries, with all the abominations they concealed beneath them, the exquisite beauty of the choir aisles could never have been seen, nor the structure adequately repaired, and as to the pews below, it is quite inconceivable to me how any one with a particle of artistic feeling could desire the retention of such mean and contemptible specimens of the worst period of church fittings.

But as you have also printed Mr. Street's report to the Bishop of Lincoln upon the general subject of refitting, I think the correspondence cannot be deemed complete without the addition of my report to the Ecclesiastical Commissioners in reply thereto, which I have now their permission to send you, and enclose herewith.

As regards the letter of Sir Edmund Beckett it was only to be expected that he would delight in the opportunity of taunting with inconsistency the advocates of a new high roof at Southwell and the retention of the old one at St. Albans ; but the cases are really widely different. At Southwell an altogether modern roof of poor construction and inferior covering is to be replaced by one of massive oak timbers, covered with lead, in exact accordance with the ancient lines and interfering with no later structural work. At St. Albans it was desired to save a genuine specimen of Mediæval construction and a ceiling of considerable beauty and interest, believed to be capable of sound repair, together with several structural features in connection therewith, which would be wholly inconsistent with the restoration of a new roof of the earlier pitch.

To the concluding remarks in that letter, unjust and ungenerous as I know them to be, I do not care to reply, excepting to remark, that if architects were capable of acting on such principles as are there attributed to them the sooner they ceased to be employed the better it would be for the buildings entrusted to their care.—I am, Sir, yours faithfully,

EWAN CHRISTIAN.

The occasion was too tempting to be neglected by the present Lord Grimthorpe, then Sir Edmund Beckett, and the following characteristic letter from him was published in *The Architect* :—

Sir,—I am out of the way of seeing *The Architect* at present, but that of August 30 has been sent to me with an account of the falling-out of those dear friends of a few months ago, "the careful and conservative architect" of the Ecclesiastical Commission, Mr. Christian, and the very high priest of "vigorous conservative restoration," Mr. Street, on the one hand, and the Anti-Restoration Society, whose secretary is Mr. W. Morris, on the other. The last time we heard of them together they were denouncing the rebuilding of the old high roof of St. Albans, with a flat ceiling under it, as before, on the ground that the (in two senses) late low roof only wanted some repairs to make it last for centuries, though now that it is down and its utter rottenness visible to everybody, the only wonder is that it had not fallen and killed a congregation. It certainly would have fallen soon if we had believed Sir G. Scott's assurances that it was sound.

It is distressing to see those two eminent recent allies of that Society now incurring their wrath, and I suppose that of the Antiquaries too (unless they have no local agitator at Southwell to stir them up), for the following catalogue of iniquities. They are charged between them with removing a flat ceiling and low roof, which they do not even allege to be rotten, or anything worse than ugly, and making the church look low, as if that were anything in an antiquarian and "interesting" point of view ; indeed, the ugliness of the apparently roofless nave of St. Albans created its special interest to the P.S.A. and his fellows. Not only are they doing that, but actually substituting an open roof also for the flat ceiling, on the ground that it will prove handsome. Mr. Street is further charged with proposing to remove the great stone screen of the fourteenth century, though that remarkable piece of vigorous conservatism has been stopped by some higher authority. They are avowedly partners in the guilt of abolishing some modern plaster screens, which Mr. Morris pronounces "very interesting," and Mr. Christian "most flimsy copies of some earlier ones." And as a climax of atrocity they are sweeping away some galleries and deal pews, which Mr. Morris calls "modern and poor in quality, but quite adequate for cathedral requirements," meaning apparently that people can sit in them. Was there no "three-decker" pulpit also to overtop the galleries, and for the anti-restorationists to weep over, or to buy by auction, and set up and lecture from in their museum of expelled modern antiquities and "unique" ugliness and putrefaction? It is not too late for them to apply for the rotten

remains of our roof here. A good deal of it can be compactly supplied in jars of dust.

However, they are not worth talking about. I should as soon offer to give lectures on church building at the Royal Academy of St. Luke or the University of Bedlam as argue with them. The really lamentable spectacle is the falling away from the high conservative principles of last year by the two leaders of that strictly impartial party of the R.I.B.A. and the antiquaries who volunteered to come here, and returned so full of indignation at our daring to replace that rotten and in every way good-for-nothing low roof, which was far worse than they say the Southwell one was, by a new one of the original height. Mr. Christian, indeed, tramples on Mr. Morris's ignorant denial of the original roof at Southwell triumphantly enough; but he is unfortunately trampling still more on the Christian and Street of last year, as Mr. Morris has just sense enough to see. For he expressly refers to St. Albans as a parallel case, though not so strongly as he might against them, and many sentences of the letters on both sides might have served equally well for either controversy, only the architects have changed their side.

Not that we proposed anything here parallel to Mr. Street's removal of the fourteenth-century screen of Southwell, though we have an enormously high screen of the fifteenth, which most people consider a mistake of the later monks (the same who began lowering the roof), and a great misfortune, as it prevents 130 feet of our 520 feet of internal length from being seen from the body of the church, including its three finest arches and the lady chapel. I wonder what Mr. Street would have said about us to his two societies and the *Times* if he had found us proposing to remove, or even to lower, the great altar-screen.

I never expected to have to be grateful to the Anti-Restoration Society. But I am for this delightful exposure, and the more so because it is so mutual. After this no one can be blind to their artistic taste (which they actually profess), or to the fact that their "preservation of ancient buildings" means the preservation of every modern debasement and defilement of them, and letting them go to ruin for the amusement of antiquaries. And as for the architects, whom they have at last quarrelled with, no one but themselves could have convinced the public that it makes all this difference whether they are employed to do restoration jobs themselves or go as volunteers to criticise the work of other people in a perfectly unbiassed state of mind—unbiassed even by personal grievances of their own, unluckily made public just too soon, as I remarked in the *Times* last Christmas Day. Yours obediently, Edm. Beckett.

THE TEMPLE OF THERMON.

FOR some little time past the Greek Archæological Society has been excavating in the neighbourhood of Thermon, the place of assembly for the ancient Ætolians. Professor Sotiarides, a distinguished scholar who is in charge of the operations, is of opinion that the Temple of Apollo, which has recently been discovered, dates apparently from the seventh century B.C. It is built on a cemetery, where may still be seen the bones and ashes of the dead preserved in large vases of earthenware. Five iron and copper swords and two buckles were also found in the large field which contains the cemetery and temple. The foundations of the temple indicate, the Professor says, that it pointed due north and south, like the ancient temples of the Etruscans in Italy. The sacred enclosure was divided into two galleries by six wooden columns, of which the bases are still preserved. The temple was 38 metres in length and 12 metres in breadth. Of the twenty marble columns which went round it the bases and various parts are preserved. Several heads, beautifully modelled in clay and coloured, stood on the cornice of the temple. Inscriptions, some giving the decrees of the Ætolian Assembly, have also been found, and are of exceptional interest.

TESSERÆ.

Horns as Title-Deeds.

AMONGST the various methods of transferring inheritances in use with our ancestors, says Pegge, was that of conveying them by a horn either in frank almoigne, or in fee, or in sergeantry. Ingulphus, abbot of Croyland, particularly specifies the horn amongst those things whereby lands were conveyed in the beginning of the Conqueror's reign. At first, he says, many estates were transferred by bare word of mouth, without any writing or charter, only by the lord's sword, or helmet, or horn, or cup; and many tenements by a spur, a scraper, a bow and some by an arrow. The Borstal horn is one example. Edward the Confessor had a royal palace at Brill, or Brehul, in Bucks, to which he often retired for the pleasure of hunting in his forest of Bernwood. This forest, it is said, was much infested by a wild boar, which was at last slain by one Nigel, a huntsman, who presented the boar's head to the king; and for the reward the king gave to him one hide of land, called Derehyde, and a wood called Hulewode, with the custody of the forest of Bernwood, to hold to him and his heirs "per unum cornu, quod est charta prædictæ forestæ." The original horn was all along preserved by the lords of Borstal under the name of Nigel's horn, and in 1773 was in the possession of John Aubrey, son and heir of Sir Thomas Aubrey, Bart., to whom this estate has descended without alienation or forfeiture from before the Conquest to the present time, by several heirs female from the family of Nigel to that of Aubrey. Of still more ancient date is the Pusey horn, "a real ox-horn two feet one-half inch long, the circumference in the largest part one foot, in the middle nine inches one-fourth, at the small end two inches one-fourth." On a ring of silver gilt that girt it was the following inscription:—"Kyng Knowde (Canute) geve Wyllyam Pewse this horne to holde by thy lond." Bugle-horn will occur to every one as being derived from buculus or bucula. Thus Johnson, word "bugle, bugle-horn," writes "from bugen, Saxon, to bend, Junius; from bucula, Latin, a heifer, Skinner; from bugle, the bonasus, Lye. It is very natural that the term of the beast should be applied to the horn. See bugle," and at that word Johnson writes "old French bugle, bos, Lacombe. A bull in Hampshire is called a bugle." It is worthy of note that Littleton (word bison) calls that beast a bugle. Many of these ancient horns—that at York affords a fine example—were of ivory and richly carved; but we have selected the two horns above described because they clearly belonged to some animal of the genus bos, though certainly not to the European bison or aurochs.

Goethe and Art.

Goethe's mind dives into the past, not with the cold abstractedness of the antiquarian, but with the fervour of the poet who transfers his life into that of ages gone by. Thus, when he resigns himself to classic recollections, his mind becomes, as it were, steeped in the sunshine of Greece and ancient Rome; it is an apprehension of the past, connecting it with the present and the future. A trait that peculiarly distinguishes Goethe is his deep reverence for art, and high sense of the dignity of its office. Art, as he regarded it in the abstract, was the power of embodying the noble and beautiful in soul—a power possessed in common by all its different branches—so that the essential purpose of all was the same. To awaken admiration has been defined as the office of poetry, and so it is with the plastic arts; they should create admiration not merely objective but sympathetic, quickening a feeling that corresponds with the dignity of the sentiment conveyed in their forms. Goethe, with the greatest veneration for the antique, never imposed a servile imitation of its models; with the philosophy of an original mind, he enjoined the artist to appropriate to himself the spirit and the thought which gave its expression to the antique in order to arrive at conceptions equally perfect.

The Italian Piazza.

"Place," according to the French rendering, is the only word that occurs as corresponding to the Italian "Piazza." In England a strange mistake is often made as to the meaning of the word piazza, by employing it to signify the surrounding porticos, as in the case of Covent Garden, instead of the large area they enclose, which is the real piazza or place. Pope in one of his letters authorised this mistake. Another error is to confound a cupola with a dome. Dome or duomo properly signifies the cathedral or principal church in a city or great town. This being in Italy (whence we have both terms) generally crowned with a cupola, has occasioned the mistake of the whole for the part.

Training of the Eye.

The works of the ancient sculptors were produced not by measuring but in consequence of that correctness of eye which they had acquired by long habit, which served them at all times, and on all occasions when the compass would fail. There is no reason why the eye should not be capable of acquiring equal precision and exactness with the organs of hearing or speaking. We know that an infant, who has learned its language by habit, will sometimes correct the most learned grammarian who has been taught by rule only; the idiom, which is the peculiarity of language, and that in which its native grace is seated, can be learned by habit alone. To possess this perfect habit, the same conduct is necessary in art as in language, that it should be begun early, whilst the organs are pliable and impressions are easily taken, and that we should accustom ourselves while this habit is forming to see beauty only, and avoid as much as possible deformity or what is incorrect. Whatever is got this way may be said to be properly made our own; it becomes a part of ourselves, and operates unperceived. The mind acquires by such exercise a kind of instinctive rectitude which supersedes all rules.

NOTES AND COMMENTS.

MR. RUSKIN has spoken severely about the modernising of Rouen, which has caused the destruction of many old buildings which made the town appear unique. His language is mild if compared with M. VICTORIEN SARDOU'S. The dramatist was invited to aid in the measures which were contemplated for the preservation of the house in which CORNEILLE lived. According to M. SARDOU, that house, having been deprived of its *pignon* and transformed to suit modern use, is no longer what it is represented to be, and can inspire only regret. Such structures cannot be re-made. M. SARDOU does not believe it is worth while to preserve the little that remains of the old house. What he desires to see is a plaque on the front with this inscription, "Here was the house of the two CORNEILLES, that the Municipal Council of Rouen considered to be unworthy of conservation." The incredible indifference of the Council has been the means of causing terrible injuries to antique remains. Of course the people of Rouen would say that, from its position, the town cannot afford to remain as an antiquity; modern interests must be served, and before they are satisfied it is to be feared many other ancient buildings must be demolished. They are proud of CORNEILLE in Rouen, but the price that is necessary for acquiring his house cannot be raised.

THE first theatre in London to adopt electrical power to assist in the construction of elaborate scenes in the manner advocated by Mr. EDWIN O. SACHS, is the Theatre Royal, Drury Lane. Mr. SACHS, who holds the commission, has been entrusted with the arrangement for moving some large sections of the stage floor—each measuring 40 by 7 feet—to any level above or below the footlights. Every movement is to be easily controllable from an ordinary switchboard. This improvement will be completed for the Christmas pantomime. The contractors are the proprietors of the Thames Ironworks, who are rapidly carrying out the plan under most difficult circumstances, for the whole of the heavy constructional work had to be erected whilst such an elaborate play as "The Great Ruby" was in rehearsal. The rehearsing was gone through on a temporary stage flooring. Shifts of men worked turn by turn day and night. The principle of the suspended electrical lift has been adopted, but in such a manner that the appliances will be a great improvement on what has been so far done on the Continent. The material is steel throughout except for the stage floor proper. It is satisfactory to find that the so-called National Theatre should have led the way in such an improvement, and credit is due to Mr. ARTHUR COLLINS and his co-directors for having met the conservatism and prejudice so common to the stage with innovations which are in keeping with this age of invention.

TEN years ago the exports of iron and steel from the United States amounted to 17,763,034 dollars, while the imports were 48,992,757 dollars. This year's returns show the values to be more than reversed. The imports have fallen to 12,615,913 dollars while the exports are 70,367,527. It is needless to say that Great Britain now receives iron and steel from the States in large quantities. American manufacturers are not only captivating the great railway companies and the corporations of our cities, but they are winning the favours of the smaller town councils. Hastings, for example, last week decided to accept the tender of a Philadelphian firm for the supply of 9,850 yards of 16-inch water-pipes, 2,670 yards of 10-inch and 500 yards of 6-inch cast-iron socket pipes, weighing in all about 2,050 tons, with an additional 35 tons of irregulars and short lengths. The tender amounted to 10,359*l.*, and apparently the lowest that was obtained from a firm in this country was 11,610*l.* Some of the best Glasgow firms, it was said at the meeting of the Council, were beaten by about 13*s.* or 14*s.* per ton. It is not in cast-iron alone America is victorious. The American official report on manufactures in iron and steel boasts that "the people of all parts of the world seem to have developed a liking for our manufactures of iron and steel; our sewing machines hum in Africa, the East Indies, Colombia, Cuba, Central America and the islands of Oceanica. Our telegraph instruments click in Japan, China, Australia, Russia and in all parts of Europe. Our wire nails go to all European countries, to Canada, British Honduras, British Australasia, British Africa and Liberia. Our electrical machinery is attracting the attention of the world." The British working man, who will read the statement of American success, will of course rejoice, for he is the main cause of the inability to compete successfully against distant rivals. But it might be well if he considered what will be his fate if the liking for foreign manufactures is further developed, for it cannot be expected that he is to be employed in order to make defeats harder to endure.

THE catalogue of the exhibition of the Northern Art-workers' Guild, which is now open in the City Art Gallery, Manchester, is worth more than its price as an example of typography in antique style. The letters bear some resemblance to the handiwork of scribes. The chapters on the various crafts by the officers of the Guild are also suggestive, and the illustrations are in keeping with the type. There are over 200 objects exhibited, which deserve attention from the people of Manchester.

ON Monday, October 10, Professor ROGER SMITH will deliver the public opening lecture of the Architectural School of University College, London, at 7.30 P.M. The subject selected is "Student's Difficulties." The committee of management of the college have reduced the fees in the classes of architecture and construction so as to bring them within the reach of students obtaining County Council scholarships, or others of equal value. For five guineas a student can now attend a course of forty lectures in either art or construction, and also the evening drawing class in the same subject.

THE Architectural Division of the Department of Western Australia has been reorganised by Mr. A. D. BELL as superintendent of buildings. Mr. J. H. GRAINGER is now chief architect, and Mr. WRIGHT chief assistant architect. The working of the division is being placed on somewhat better defined bases than hitherto. New works under erection by contract are controlled by the chief and assistant architects as executive officers, and continuous inspection is exercised by travelling officers. The practice of having resident supervisors of commonplace qualifications on separate works is being altered, so far as the conditions admit, in favour of a system of travelling supervisors of higher qualifications, a smaller number of whom will thus more effectively cover as much ground and as many works. A resident district officer in each of the more settled country districts—of which Albany, York, Bunbury and Geraldton are the centres—maintains the general oversight of all the works within his boundaries. The metropolitan district is served from and by the head office in Perth. On the goldfields, and in the more distant parts of the colony, which cannot be so frequently visited, an officer in charge is established, with supervisors under him. The Coolgardie goldfields, the Dundas goldfields with Esperance and the South Coast, the Murchison goldfields and the North-West Coast, form four districts under such officers, who are responsible for all the general works and services required, the designs and specifications for larger and more important works being supplied from the head office, inspecting officers from which periodically visit and report upon the working of the districts. The chief architect and his assistants, and through them the superintendent, are thus kept in close touch with the progress and manner of execution of each work, enabling a sound opinion to be formed as to the knowledge, capacity and energy with which affairs falling to their charge are administered.

CATHEDRAL SERIES.—SOUTHWELL: DETAILS OF CARVING IN CHAPTER-HOUSE.

THE QUEEN'S SITTING-ROOM, THE HAGUE.

KELSEY, BECKENHAM.

THIS house stands on the west side of the high-road to West Wickham. The facing bricks are red, and the roofs are of slate. The work was carried out, under the superintendence of the architect, by MESSRS. SYME & DUNCAN, builders.

VENTILATION AND WARMING.*

(Continued from last week.)

Allowances of Cubic Space.

I HAVE adopted as a basis of my inquiry the allowances of cubic space recommended or confirmed by the cubic space committee of 1867. In reply to the question, "Do the committee consider it essential to health that any addition should be made to the minimum space of 300 cubic feet, which is now required for each bed in wards occupied by night only, by healthy adults or children?" the following answer was returned:—"The committee have had before them no evidence to show that the minimum space now required is too little;" and in answer to a further question they say, "The question of cubic space is subordinate to the more important question of ventilation, by which the committee mean the continuous renewal of the air within a given confined and inhabited space of whatever shape, size or surroundings, so that it shall be kept pure, or nearly pure, and shall vary within a few degrees only of moderate temperature. It is plain that the complete and scientific solution of the problem of ventilation thus understood would govern and include the scientific answer to the questions of space proposed by the Poor Law Board for consideration by the committee. The requisite space when settled once for all will need no further pains; deviations from the prescribed amount can scarcely escape notice. It is not so with ventilation, yet if this be neglected all regulation of cubic space becomes an idle care. The committee, therefore, would suggest watchful and constant attention to this subject of ventilation, to its easiest, cheapest and most effectual methods, and to the means of adapting them to the various forms and dimensions of existing rooms. Whatever methods are adopted should be rigidly enforced by some resident official or frequent inspector; they should be made secure against the intermeddling of pauper inmates and servants of the house, and they should avoid the ingress of strong currents of cold air or at least the incidence of such currents upon the bodies of the inmates."

Thirty years have elapsed since these replies were given, yet, if the same questions were put again to-day, it is probable that similar answers would be returned. There can be no question that, if the minimum allowance of cubic space were increased, the problems of ventilating and warming the several rooms would be made somewhat easier, but the remaining difficulties in the way of furnishing a scientific solution of the problem of ventilation, and giving a scientific answer to the question of cubic space, which the former is rightly said to govern, would remain the same in kind, though less in degree. The problem is a quantitative one, and requires a quantitative answer, yet the quantitative information about the appliances for ventilation and warming to be found in the Poor Law schools extends to little beyond the data which would be contained in an architect's specification, with occasional observations of temperature by those in charge. In actual practice we are not in a much better position for giving a precise quantitative answer to questions as to the efficacy, under varying conditions, of the various appliances than we were thirty years ago. Methods of ventilation have indeed commanded a great deal of attention, and great progress has been made in devising new and improved systems, but the criticism of the older systems is still for the most part qualitative, and I should doubt if any ventilating engineer would decline to undertake the responsibility of providing means of keeping the air of the several rooms of the Poor Law schools pure, or nearly pure, while avoiding cold draught, on the ground that the allowance of cubic space is too small. It may fairly be assumed that with the continuous improvement of the means of ventilation a point would be reached beyond which the renewal of air could not be carried without going to expense that might as well, or better, be devoted to providing fresh accommodation; but that critical point is, in my opinion, not yet reached in any of the buildings that I have inspected. The immediately recognisable obstacle in the way of satisfactory ventilation and warming in the schools at the present time is not the smallness of the cubic space allowance, except in the cases of certain infirmary wards in which the minimum allowance is less than 850 cubic feet per bed, and where, but for the too great number of patients, the existing arrangements would be tolerably satisfactory. In the dormitories, for example, the increase in the space allowance from 300 to 400 or 450 cubic feet per bed would not make the existing arrangements satisfactory. There would still be the dilemma of too little air, or too low a temperature in cold weather. Moreover, the information at present at my disposal is not enough to enable me to say when the critical point would be reached at which further modifications of the arrangements for ventilation and warming would be unremunerative, nor could the information be obtained experimentally for the rooms of the schools with their present arrangements for warming.

Consequently, the suggestion of "watchful and constant attention to this subject of ventilation" is as appropriate now as it was in 1867, and to secure results that would be of direct use in deciding between the alternatives of more efficient ventilation and more cubic space, it is necessary that the watchfulness and attention should be given not merely by architects in planning buildings and by hot water or ventilating engineers in introducing modifications of existing arrangements, but also by others, "resident officials or frequent inspectors" as suggested by the committee of 1867, who see the arrangements from time to time in actual work, and, if necessary, can watch their action for considerable continuous periods. Within the watching should be comprised such systematic measurements of temperature, air-flow, air-composition or other particulars as would furnish evidence for sound opinion not merely upon the simple questions whether a room is well or ill-ventilated, warm or cold, but upon the much more searching questions, if the rooms are ill-warmed or ill-ventilated, to what extent they are defective and to what specific causes must the defects be ascribed.

While the definite answer to the question of cubic space must still be left for future consideration, there are signs that the question may be gradually approached in a slightly different manner. With the mechanical system of ventilation, the amount of air supplied and its temperature are much more definitely determinable than when the draught of chimneys or the effect of wind is relied upon as the means for renewing the air. When once the ducts have been formed, the maximum amount of satisfactory ventilation is practically incapable of variation without great structural alteration. Any difficulty that arises cannot be shelved by opening the windows for a little while when complaint is made of the closeness of the room. Practically all that can be said, if the air is found to be offensively close, is that there are too many inmates in the ward, and all that can be done is to find accommodation for some of them elsewhere; in other words, the allowance of cubic space must be governed by the amount of ventilation actually provided in any special case.

Hitherto the statement of the problem has been, "Given a ward intended for so many beds, how can the necessary amount of fresh air be supplied?" It is now becoming changed into the much easier form, "Given a ward provided with certain appliances for ventilation, how many beds can be properly accommodated therein?" The answer may be different for wards of the same dimensions, according to the extent and effectiveness of the appliances provided. It should be determined by the actual performance of the apparatus in action, and not by the efficiency assigned in anticipation. I see no sufficient reason for limiting this form of stating the problem to those wards which are partially or wholly ventilated by mechanical means. It can also be employed when the ventilation is by open fires or open windows. To give a satisfactory answer in the latter cases would doubtless involve more observations, and perhaps greater judgment in interpreting them, and the margin for contingencies should be somewhat greater than with mechanical ventilation, because the air supply is more variable, and regard must be had to minimum as well as average efficiency under various conditions; but, treated from this point of view, a reasonably scientific answer to the question of cubic space is at least possible.

In making recommendations as to the ventilation and warming of the schools, I have had in view this method of fixing the allowance of cubic space, particularly in the case of infirmary wards. When I have given definite numbers, however, I have been conscious that many of the data are provisional only and may require correction from time to time, but the method appears to me to be sound in principle and feasible in practice, and to mark out the line along which progress is most likely to be assured.

SECTION II.—DORMITORIES.

Quantity of Air.—Examination of the System of Cross Ventilation.

This part of the subject must, for reasons given above, be treated from the point of view of the system of cross ventilation between windows (or their equivalents) on opposite sides of the rooms. The problem to be solved is, therefore, very different in different special cases. The number of rows of beds does not give complete information, because the number of breathing individuals to be provided for is very different if the beds are arranged longitudinally or end on from what it is if they are arranged side by side, with heads and feet in parallel lines. We may, perhaps, better consider the requirements if we suppose that a room 56 feet 6 inches long, 18 feet wide and 12 feet high is intended to accommodate thirty beds. This gives an allowance of 400 cubic feet per bed, with a wall-space per bed of rather less than 4 feet. A room 9 feet wider would accommodate another row of beds side by side, one 18 feet wider would take a fourth row. I have considered the following

* From the report by Professor W. Napier Shaw, M.A., F.R.S., on the ventilation and warming in certain of the Metropolitan Poor Law schools.

problem :—"At what rate must the wind be blowing upon the windows upon one side in order that each bed may have its allowance of air for ventilation (3,000 cubic feet per hour), the number of windows on each side being five, each window being 3 feet wide, and the opening of each being 2 inches?" My solution of the problem, when there are two rows of beds, is that the wind must impinge at 12·6 miles per hour upon the windows.

The average rate of wind, as recorded by the anemograph at the Kew Observatory, is about 7 miles per hour. The instrument there is 70 feet above the ground. The windows of dormitories are not so fully exposed. Moreover, the calculation assumed the wind to be impinging directly upon the windows, and if the wind be oblique the effect in forcing air through the openings depends partly upon the component of the velocity perpendicular to the window, and partly also upon the eddies caused by the projections at the sides of the windows. So that the 12·6 miles per hour resulting from the calculation must be regarded as much greater than the average velocity available for purposes of ventilation. The hypothetical allowance of window opening (2 inches) is too small. We have assumed five windows (each 3 feet wide) to a row of fifteen beds, or 1 foot width of window per bed. And the calculation goes to show that for each pair of opposite beds a 12-inch by 2-inch opening on each side would only be sufficient if the wind velocity were about 12 miles per hour and directly upon the opening. The wind is so variable for different localities and at different times that it is difficult to place much confidence in its average velocity for the purposes of ventilation, but assigning six miles per hour as a number to work by, it appears that a pair of opposite beds requires a 12-inch by 4-inch opening on each side. Further, if the opening be covered by perforated zinc or a grating, its effective area is probably halved, and we must assign 12 inches by 8 inches of covered opening as the necessary allowance on each side for a pair of beds.

If there are three rows of beds the allowance of window opening must be taken at half as much again. For four rows of beds we require 12 inches by 8 inches free opening in opposite windows per string of beds as taken between windows.

Taking an extreme example, suggested by the Edmonton boys' dormitories, we have there in effect about 100 feet of wall space on each side, with eleven windows on each side, for approximately 200 boys. We must, therefore, allow for a string of six beds to each foot of window; the corresponding amount of clear window opening to provide for the ventilation when the wind is blowing directly upon the windows at six miles per hour is 12 inches, or for covered openings 24 inches. This assumes the windows to be 3 feet wide. The Edmonton windows are practically 4 feet in width, so that the windows should be open 9 inches clear, or 18 inches if covered.

I make no pretensions to minute accuracy in these calculations. They are only intended to give a rough idea of the requirements of the cross ventilation system as applied to dormitories. It will be seen that the amount of window opening required depends simply upon the number of lines of beds, supposing they are placed with their lengths between the opposite windows. Thus, at Leytonstone the dormitories are much smaller than in most schools, but there are four rows of beds between opposite windows. To each string of four beds there should correspond two-thirds of a square foot of window opening on each side. There are three strings of beds, and there is an aggregate of 7 feet of window on each side, so that for the six mile per hour breeze the windows should be open 3½ inches to efficiently provide for ventilation, or 7 inches if the opening be covered.

From these computed amounts of window opening some allowance may be made on account of air-bricks, open chimneys, or other means of ventilation. A fair-sized open chimney, taking account of the fact that the wind blowing across the top will add to the head for ventilation, may perhaps be regarded as equivalent to half a square foot of window, and a 9-inch by 6-inch air-brick, with a grating on the inner side, as about 12 inches by 1·5 inches of window opening. Thus, from the full allowance in the Edmonton case, where there are ten chimneys and on one side eleven air-bricks, with some ceiling ventilators in the other side, we may deduct altogether 3·5 square feet of window opening from each side. This reduces the necessary opening by about an inch, so that 8 inches on each side is the amount of clear window opening required to supplement the fixed air gratings and chimneys, or 16 inches if the opening be covered with perforated zinc. It is clear that a 2-inch window block to each window cannot be expected to secure the amount of ventilation which is necessary in such a case, and if we regard a 6-inch opening (12 inches if covered) as being the maximum allowable in consideration of proper protection against rough weather, it is further clear that the system of cross-ventilation is not properly available for more than a certain number of rows of beds if there is a foot of window to each bed. Three rows, indeed, reach the limit.

The allowance of 3,000 cubic feet of air per hour per bed is liberal. I have no information upon which to decide whether it is excessive; if some other allowance be adopted all the areas can be reduced in proportion.

Open Windows necessary in all Dormitories for Efficient Ventilation.

We may conclude that for efficient ventilation upon the system of cross-currents between opposite sides of the room under such conditions of wind as commonly occur, it is necessary to supplement the special ventilation openings to be found in the schools inspected by opening the windows on each side to an extent comparable with 4 inches for two rows of beds, 8 inches for four rows and so on, allowing 1 foot of width of window for each string of beds across the room, appropriate deductions being made for chimneys, air-bricks, Tobins or other openings.

Ventilation in Calm Weather.

The next question for consideration arises from the obvious fact that there are frequent occasions when the wind does not impinge upon the face of a dormitory at six miles per hour; in other words, the system of cross ventilation is liable to fail in calm weather. We have then to depend upon the heat arising from the difference of temperature between the inside and outside. For the head thus arising to produce its maximum effect, there must be as great a difference as possible of vertical height between the openings used as inlets and those used as outlets. The arrangements in vogue for floor and ceiling ventilation are commendable (if the ducts be clean) from this point of view, though they are inadequate as regards size. Moreover, the practice of supplying the upper openings with hopper valves, which throw upwards the air coming in by them, reduces their efficiency for calm nights, because the cold air may form a sort of syphon trap restricting, if not preventing, the flow when the opening is required to act as an outlet.

A further reflection upon this situation of affairs is that the head due to 10 feet of warm air is not sufficient to insure a very active circulation, and it is probably idle to attempt to ventilate in calm weather by openings without motive power more than one line of beds for each row of windows.

Cross Ventilation in Relation to Temperature.

We have further to consider the system of cross ventilation from the point of view of the temperature of the dormitories. The supply of air is cold. When the system is efficient for the purposes of ventilation, the proportion of window area to wall space is so large that there is no possibility of making any great storage of the day's heat in the walls to be drawn upon for warming the air during the night. The inmates themselves furnish a certain amount of heat, and in the mixing of the fresh air with the air surrounding the beds the temperature of the mixture is raised in inverse proportion as the amount of carbonic acid is diluted. Here, again, a rough calculation will help us. Assuming each inmate to give out 284 lbs. Fahr. units of heat per hour, and that this heat is uniformly distributed over the 3,000 cubic feet of air supplied for ventilation, I have computed that the air of the dormitory will be maintained at 5 degs. Fahr. above that of the air supplied, making no allowance for any gain of heat by conduction from warm walls or loss through cold windows.

I have no knowledge of the exact amount of loss to be allowed on that account, and at a guess I put it at one-half of the total amount for a dormitory of two rows of beds supplied with a proper number of windows for the purposes of ventilation. It would in any case be less for wider dormitories. The assumption I have made reduces the temperature to 2·5 deg. Fahr. above that of the external air in the case of narrow dormitories, leaving it perhaps at nearly 5 deg. Fahr. for such a wide dormitory as that at Edmonton. I am at present leaving out of account artificial warming altogether. There are of course many days in the year for which this temperature of 2·5 deg. Fahr. above that of the external air can be accepted as satisfactory. Having regard to the fact that the inmates of the Poor Law schools are accustomed to be out of doors a good deal we may perhaps assign 40 deg. Fahr. as the lowest limit which the temperature of a dormitory ought to be allowed to reach. There are many occasions upon which the thermometer in the external air falls much below 37·5 deg. Fahr., and on such occasions we should expect efficient cross ventilation to be attended with a fall of temperature below what can be regarded as healthy. The method of warming adopted in nearly all the dormitories inspected is by open fires, and in many instances, I understand, it is not considered safe to have the fires burning all night. They are allowed to go out at bed-time. The officials, therefore, in attempting to work the system of cross ventilation without specially adapted provision for warming, are on the horns of a dilemma in cold weather. They must either reduce the supply of air in order that the temperature may be maintained or allow the temperature to run down below—and in a cold spell of weather very far below—the limit which ought to be maintained.

Conclusions drawn from the Examination of the Systems of Cross Ventilation.

I may sum up the more or less theoretical conclusions about the system of cross ventilation as follows :—

1. Unless care be taken to have windows open on both sides of the dormitories the air supply will be insufficient to maintain the freshness of the dormitories within the limits of respirable impurity.

2. The amount of window opening required for the ventilation of the dormitories with large numbers of rows of beds is greater than the officials would naturally provide, and is, indeed, so great that the wind would blow through the room without any mitigation, and such dormitories in ordinary use would not be effectively ventilated.

3. The ventilation would depend very largely upon the wind, and would fail when the wind was very light.

4. In those cases in which the ventilation was effective the temperature of the dormitory would follow closely that of the outside air, and would not exceed that of the outside air by more than about two and a half degrees.

I may also add the practical conclusions—

5. The exposure of the window openings to driving rain makes it unlikely that they would be kept open in bad weather.

6. Though it is better to open all windows a little than to have one pair widely open and the others shut, the latter is the arrangement which can be carried out with least trouble.

Suggested Modifications to make the System of Cross Ventilation more Generally Applicable.

The most characteristic feature of efficient cross ventilation is its coldness. I have put down 37·5 deg. Fahr. as the lowest tolerable limit of external temperature, 40 deg. Fahr. being the probable internal temperature corresponding thereto when there is no artificial warming. I have no wish to assign a high limit to the minimum temperature, as I share the opinion that it is better to make up for cold air by extra bed-clothes than by artificial warming. If getting up had not also to be considered, and if the children were able to run to a fire occasionally after getting up, a temperature occasionally lower than 40 deg. Fahr. might do no harm ; but the number of children to be dealt with implies uniformity of treatment, and for them to turn out with the temperature of everything in the room—floor, bedstead, &c.—below 40 deg. Fahr., and to work from that starting-point for the day, must probably be deleterious to health. It becomes therefore important to consider whether artificial heat can be suitably applied to the dormitories. Two methods of heating are available, viz. by hot water or steam pipes and by open fires. I propose to consider first the heating by hot-water or steam pipes.

If we assume, as in our previous calculation, that one window supplies air for six beds (18,000 cubic feet per hour), and if we suppose that the greatest cold to be expected is 10 deg. of frost, corresponding to 22 deg. Fahr., it would require, according to Hood's Table, 25 feet of 4-inch pipe or 50 feet of 2-inch pipe to raise the temperature of this air to 45 deg. Fahr., the pipes being maintained at 200 deg. Fahr.; with steam pipes fully heated less length of pipe would be required. To raise the temperature to 40 deg. Fahr. about 38 feet of 2-inch pipe would be required.

The best distribution of the hot-water pipes with regard to the windows would probably be to have coils or radiators under each window, the windows being opened at the top to supply the air. From each radiator there would rise a vertical ascending current of hot air, which would mix with the air coming in at the top of the window, and the heat would thus be distributed through the room and the coldest draughts would be avoided. This position for the hot-water radiators is not the most economical of fuel. For whereas the rising stream of hot air on the one side of the room would mix with the incoming air and the heat be distributed throughout the room, on the other side where the air was going out the hot air rising from the pipes would pass directly to the outside and be lost. Still, unless we can foresee on which side the wind will blow and move the hot-water pipes so as to accommodate their position to the varying direction of the wind, we cannot differentiate the two sides, and the sacrifice of heat is inevitable. It is, moreover, not altogether wasted, for the radiators in promoting an active circulation of air in their neighbourhood do good service by promoting the distribution of fresh air and warmth. Further, the heat is distributed from the radiators not only by heating the air but also by radiation, and the radiators on the leeward side would contribute part of their heat to the raising of the general temperature of the room. We might, therefore, if radiators are placed under each of the windows in order to be prepared for winds from either quarter, allow only 25 feet of 2-inch pipe under each window, instead of 38 feet, in consideration of the radiation from the pipes on the leeward side.

The coal required for the specified amount of heating for 100 beds I compute at 13 lbs. per hour.

I have shown the extreme amount of heating required. When the thermometer outside is not so low as 22 deg. Fahr. it would be advantageous to reduce the temperature by reducing the circulation of the hot water or by cutting off some portion of each radiator, if there are steam pipes. On account of draughts, it would not be desirable to reduce the heating by cutting off the whole amount of the heat under one or more windows, while retaining that under the others at full power.

(*To be continued.*)

GLASGOW ARCHITECTURAL ASSOCIATION.

THE opening address of the winter session was delivered on the 20th inst. by Mr. Geo. S. Hill, A.R.I.B.A., president, his subject being "Architectural Tradition and Precedent." The distinction implied between the two terms was gone into closely and clearly, noting that the acquaintance of history of any particular branch of work was invaluable for many reasons, but at all times the element important to us, which is entirely absent from the past, was the present and all that it implies. Every young designer was advised to obtain a clear and articulate idea of the position held by these great factors, as by their aid the superficial attractions of quaintness and eccentricity can be evaded when his hand can be laid upon what he knows infallibly to be good. It requires but a lively if not over-refined fancy to impart to present conditions a clothing never before represented. This is all that much of the modern work has to depend upon ; in it ofttimes lies something analogous to the abnormal, the freak in nature, which is never pleasing ; the rationale of such architecture is in the designers themselves, and they themselves are the only court of appeal by which it might be judged, taking refuge from outside criticism behind the assertion, "but you do not understand." Mr. Hill pointed out that the great epoch-making features and characteristic forms were not the outcome of any feverish desire for something new, but came by the pressure of their own manifest advantages, and concluded his very able address with the truism that "To advance wisely we must refresh ourselves liberally from the past." A hearty vote of thanks was awarded to the President for his most interesting address.

INNERPEFFRAY CHURCH, CRIEFF.

THE ancient church or chapel of Innerpeffray, situated in an elevated position near the river Earn and fully three miles east of Crieff, has recently been restored. This old collegiate church had during a long course of years been allowed to fall into a state of general disrepair. The roof was not only getting into a dilapidated condition, but the walls and general interior of the building, in which so many of the ancient and noble dead of the district repose, had also been much neglected. The right of burial in the church is retained by three of the landed families in the district, namely, the Earl of Ancaster, the present head of the House of Drummond, Drummond Castle ; Viscount Strathallan, the representative of the Drummonds of Strathallan, and the present proprietor of the estate of Innerpeffray; the Hon. Captain Hay Drummond, a brother of the late Earl of Kinnoull. Some time ago these three custodiers resolved to have the old church put into a proper state of repair, and this has now been very satisfactorily accomplished. It is said that the date of the first building of the chapel is not known, but it must have been at a very early period, as there is record of certain deeds having been signed in it in the year 1283 In all probability there was some official connection between the church of Innerpeffray and the abbey of Inchaffray, founded in 1198, and which is situated a few miles further east. At any rate, there is authentic record of Innerpeffray Chapel in 1342, and it was made into a collegiate church in 1508 by the first Lord Drummond, who is described as the first provost of Innerpeffray. Authentic information in this respect is supplied by the Rev. John Fairbairn, minister of the adjoining parish of Madderty (1620-57), who was a relative by marriage of the Drummonds, and who in an account of the House of Drummond, says :—"John, Lord Drummond, having re-edified the chapel of Innerpeffray from the ground, and erected it into a college for some few prebendaries to pray for requims for him and his house, ordained it to be their burying-place for all time coming, and being nearly eighty years of age, he framed one of the most material and perfyte testaments that ever I saw, and syne closed his eyes and time togidder, and was most honourably interred in Innerpeffray Chapel in year 1519. On June 4, 1507, the king confirmed in mortmain the charter of John, Lord Drummond, by which, for the souls of the King and Queen, for his own soul and that of Elizabeth Lindsay, his wife, and the umquhile Margaret Drummond, his daughter, &c., be granted as a pure free alms-gift to four chaplains to celebrate the Divine offices for ever at the four altars in the church, dedicated in honour of the

Blessed Virgin, of Innerpeffray, an annual income of forty merks from his land of Innerpeffray and Dunfallys, with houses, residences and gardens, to be marked off and built for each, with the right to each of them of obtaining necessary fuel in the common mure of Innerpeffray, with four-sums for grasses and for one horse." The chapel now stands as "re-edified" by John, Lord Drummond. According, however, to archæologists, the western portion of the edifice was not rebuilt by Lord Drummond, as that part shows evident marks of greater antiquity. The chapel is a long, low, narrow building, measuring about 80 feet in length and 22 feet wide, and is still entire, with the exception of the sacristy near the north-east end, which had communicated with the chapel by an arched doorway, still remaining, although now built up. One peculiarity in the church is the round chancel archway, placed about 8 feet from the west end, which appears to have formed a vestibule, having evidently been filled in by some sort of a wooden screen, judging from the holes cut in the stone arch and pillars. In the wall of the arch there is an oblique opening, known as a "squint." It is rarely, if ever, seen in ecclesiastical buildings, and was, it is said, used by those who were late in attendance to hear Mass, without attracting the attention of the priest. A narrow circular stone stair, in the north-west angle, leads from the vestibule to a room immediately above, which has a small window and fireplace, and a bevelled opening in the wall over the arch looking into the church, and is said to have been used by David Drummond, third Lord Madertie, during public worship. (This Lord Madertie was the founder of the ancient library that is restored in the house closely adjoining the church, he having by his will, dated 1691, bequeathed the half of 6,000 merks for the maintenance of the library and schoolhouse which he had erected at Innerpeffray.) It is also stated that the small room referred to was used by Lord Madertie for holding his books, and where, after the death of his second wife, Lady Beatrix Graham (sister of the great Marquis of Montrose, whose Bible, with autograph inscribed, is still in the library), he spent a large portion of his time. The ceiling of this western portion of the chapel bears traces of having been all painted in bright colours, and has a representation of the sun, with clouds around, and until lately had the figure of an angel appearing out of the clouds blowing a trumpet held in the hand, but that portion has been destroyed. There now only remains a small part of the ceiling, and steps have been taken to preserve it. The church originally had three doorways, secured by wooden drawbars on the inside. The jambs and lintels have been elaborately moulded, and the windows are double-splayed and filled in with strong iron interlacing bars. The south doorway is arched and moulded in the inside with moulded corbels. The door in the west end is supposed to have been one of the entrances to the original chapel, and was allowed to remain. Two small doors in the north side of the building are built up, one of which had apparently served as an entrance to the chancel. On the south side one of the original doors has been made into a window, and one of the windows now forms the door on that side. What is called the "stoup" is placed on the right-hand side of the south doorway, and is of plain design with projecting bracket. A stone altar is still intact, and stands against the east wall. A number of consecrated crosses are to be seen on the walls of the interior; and one evidence that the west end of the chapel is of much earlier date than the eastern portion is shown by the finding on the west wall of two crosses of dedication and consecration—one on either side of the door. In ancient chapels the usual number of such crosses was seven, and six have now been discovered in this church. Traces of painting are still visible on some portions of the plaster-work. Externally, the gables have crow-steps, and in the east one there is a niche with a bracket, in which evidently there was a statue of some saint—probably the Virgin Mary, to whom the chapel was dedicated. Two shields, bearing the three bars wavy, gules—the coat-of-arms of the Drummond family—are also to be seen on the outside walls. It may further be mentioned that at each of the four corners of the old graveyard beside the church there stood what was called a "roundle," or small tower, and one of these remained up till about the beginning of the present century. The "roundle" was stated as consisting of a ground-floor and a room, with fireplace, on the next floor.

As already mentioned, the interior of the sacred edifice has been long the burial-place of the Drummond families, and is divided into three portions. Viscount Strathallan's family, however, now have a vault in the ancient chapel of Tullibardine, and no longer inter their dead at Innerpeffray. On April 4, 1688, Lieutenant-General Drummond, first Lord Strathallan, was buried in the Strathallan portion. On that occasion a funeral sermon was preached by Dr. Munro, principal of Edinburgh University. A copy of the sermon (which occupies some fifty-six pages of small octavo) is in Innerpeffray Library. In the Drummond Castle portion of the chapel the last interments were those of Lord and Lady Perth (the great-grandfather and the great-grandmother of the present Earl of Ancaster), to whom the extensive estates of Drummond Castle were restored about the year 1784, after the forfeiture by Government in 1746. Although there is no record known, it is very probable that all the Lords Madertie are also buried in the chapel. David, the founder of the library, and his two wives—Alison Crichton and Beatrix Graham, the latter, as already stated, being sister to James, first Marquis of Montrose—are likewise buried here.

It will thus be seen that this ancient ecclesiastical edifice is one of much historical and antiquarian note, and it, along with the old library adjoining and its unique collection of books, as well as the old castle of Innerpeffray, also near by, are of great interest, and are resorted to by many of the visitors from all parts of the kingdom who annually sojourn in Strathearn.

The roof of the chapel has been thoroughly overhauled and repaired with stone slates in keeping with the old roof. A great improvement has also been made by the removal of the soil all round the church, and exposing a fine dressed double base-course, which was perfectly hid before. Handsome home oak doors have been put on, studded with iron bolts, and all the windows have been opened up. The floor of the chapel has been levelled, and for the most part gravelled and turf laid over the graves. Altogether the repairs and improvements carried out in and around the chapel are such that will preserve intact this ancient landmark—now over five centuries old—for many years to come, and Lord Ancaster and other proprietors merit warmest thanks and commendation for their generous conduct in the work of renovation. The various improvements were carried out under the personal supervision of Mr. G. T. Ewing, architect, Crieff.

THE SANITARY INSTITUTE.

THE seventeenth annual congress of the Sanitary Institute was opened in the Birmingham and Midland Institute on Tuesday, under the presidency of Sir Joseph Fayrer. In his address the President said:—

We live in an age of progress and discovery. Intellectual activity has never been greater, scientific research never more profound or far-reaching, whilst the practical applications of the discoveries of science are not less remarkable. Among many subjects of interest which were laid before our gracious Queen on the completion of the sixtieth year of her glorious reign, few, perhaps, if any, afford better ground for congratulation than the improvement in the vital statistics of her people, as shown by reduced death-rate, enhanced expectation of life, decline in some of the most potential death-causes, and the almost total disappearance of others.

In effecting this improvement the Institute which I have the honour to represent, and which holds its seventeenth annual congress this year, has taken an important part. It was the outcome of the impulse given to sanitary science by the Public Health Act in 1875, which itself was a result of the growing conviction that public health was a subject which demanded more consideration than it had hitherto received.

At a public meeting held in London in July 1876, presided over by His Grace the Duke of Northumberland, it was resolved that the sanitary condition of the country is still very unsatisfactory, that further legislation is necessary with a view to its improvement, and that for the purpose of collecting and imparting information upon all matters connected with the subject of "public health" a society be formed to be styled "The Sanitary Institute," and a committee was appointed to give effect to the terms of the resolution. Since then the progress of the Institute thus founded has been uninterrupted, and its influence for good has steadily increased. In the same year, 1876, the Parkes Museum was founded at University College as a memorial to Dr. E. A. Parkes, first professor of hygiene at Netley, and in its galleries were exhibited various hygienic appliances for the purpose of affording information by the objective method of teaching. Its Council originated and managed the International and Sanitary Exhibition at South Kensington in 1881, which was presided over by the Duke of Edinburgh. It was in 1882 incorporated as a society, its treasures were transferred to premises occupied by the Sanitary Institute, and the two institutions having a common object worked harmoniously together and practically became one. In August 1888 they were formally amalgamated and re-incorporated under the title of the Sanitary Institute of Great Britain. In 1887, just before the amalgamation took place, the Sanitary Institute, in conjunction with the Society of Medical Officers of Health, invited the International Congress of Hygiene and Demography to meet in London, which it did in 1891 with great success.

The object which the Institute has kept steadily before it from the outset has been the advancement of sanitary science by the promulgation of sound scientific and practical teaching of those principles on which health depends, by which life is prolonged, and the physical and thereby the moral welfare of the people promoted.

One of its earliest steps, taken in 1877, was to establish examinations for local surveyors and inspectors of nuisances, in order that the officers who had to carry out the provisions of the Public Health Act should be competent for their duties. The Council also arranged to hold an annual congress in some provincial town, in order that papers should be read and discussions take place, whilst at the same time exhibitions of sanitary appliances were arranged as object lessons, and judges appointed to examine the exhibits and award prizes. Since amalgamation with the Parkes Museum the same work has been continued, with the addition of periodical meetings, at which papers are read and discussed, the publication of transactions and advanced examinations, while to aid the important teaching work it was carrying on, it collected and published the works of Simon, which deal exclusively with the problems of sanitary science, and of Farr and others, has gradually accumulated an excellent library, and instituted lectures and practical sanitary demonstrations for the benefit of medical men, which subsequently were considerably extended and more elaborately organised. Under the patronage of the Duchess of Albany and the presidency of the Dukes of Northumberland and Westminster, and latterly of the Duke of Cambridge—who had already been connected with the Institute for fourteen years, and had not only displayed great interest in its work, but had rendered it valuable assistance—and under the guidance of such men as Sir D. Galton, Lord Fortescue, S. F. Powell, Mr. Rogers Field, Dr. Corfield and others who had been its early supporters and founders, it steadily developed its purpose of diffusing practical sanitary knowledge throughout the country and attained its present influential position.

An idea may be gained of the scope of the operations of the Institute by reference to the epitome of the work done in 1897, which was as follows :—

London Lectures and Examinations.

	Total Attendance.
4 Sessional meetings for discussion of sanitary subjects	285
36 Lectures to sanitary officers	2,251
2 Special demonstrations, inspection of meat	140
34 Practical demonstrations for sanitary officers	925
2 Examinations in practical sanitary science	34
2 Examinations sanitary inspectors	213
138 Classes brought to the museum	1,674
Other persons visiting the museum (estimated)	17,500

Provincial Examinations.

8 Examinations sanitary inspectors and practical sanitary science	316

Congress and Exhibition at Leeds.

6 Sectional meetings	706
8 Conferences	850
3 Addresses and lectures	956
Exhibition open for twenty-three days, at which a number of lectures and demonstrations were given	75,790

All this is effected entirely by private enterprise, unaided by any subsidy either from Government or other public authority, by which it is from time to time consulted and to which its services are most willingly rendered. As an illustration of the progress made it may be stated that when the first Congress took place in 1877 there were 150 members and the income was 240*l.* In 1896 the members were 2,100 and the income 6,000*l.* In 1877 five candidates were examined for certificates, in 1896 521 were examined, of which 300 obtained certificates.

The time at my disposal does not permit of tracing in detail the history of the growth of sanitary science from times of ignorance and superstition to its present well-established foundation on a scientific basis, but I may at once say that it is indeed only comparatively recently that preventive as distinguished from curative medicine has assumed the position of a science at all; it is now from a hygienic point of view the more important of the two, though the difficulties attending its application are still considerable and largely such as arise from ignorance and incredulity.

Half a century ago the great mass of the population lived and died under conditions which violated all the now well-known principles on which health depends; prejudice, ignorance and vested interests stood in the way of progress, and but little effort made to correct the one or remove the others; Government looked on with indifference; the people knew little and thought less of the efficacy of pure air, pure water, cleanly and uncrowded dwellings, temperance and other conditions which are now well known to be essential to health. They had no idea that infective disease is but too frequently the scourge of uncleanliness, overcrowding and disregard of simple laws of health.

Under the influence of such reformers as Chadwick, Parkes, Richardson, Simon, Southwood Smith, Sutherland, Bristow, Buchanan, Netton Radcliff, De Chaumont, Corfield, Thorne, Notter, Seton, L. Parkes, Ballard, Power, A. Hill, Armstrong, Russell, Littlejohn, Cameron, Smith, Ransom and others, to say nothing of sanitary engineers such as Rawlinson, Galton, Rogers Field, Hawkesley, Mansergh, &c., measures which were regarded as mere theories or fads of no practical value are now accepted as of cardinal importance. Statesmen have learnt to realise that sanitary science comes well within the sphere of practical politics, and that it is an important part of the duty of executive governments, whether general or local, to protect the people from disease which may be prevented or controlled.

Numerous Acts of Parliament have been passed, such as the Public Health Act of 1875, Rivers Pollution Prevention Act 1876, Public Health (Water) Act 1871, Acts for Housing the Working Classes 1885 and 1890, Infectious Diseases Notification Act 1889, Infectious Diseases Prevention Act 1890, Isolation Hospitals Act 1893, Public Health Act for London 1891 and many others. Officers of health, sanitary engineers and sanitary inspectors have produced a better state of things; the poor are no longer left to be a law unto themselves on such matters. Public health is cared for in a sense which was utterly unknown in the past; houses are better built, sewerage, drainage and ventilation are provided for, the land is better cultivated, the subsoil better drained; the absolute importance of pure drinking water is recognised, food is more varied and more nutritious in its character, clothing is better adapted to climate; and were all the existing official provisions enforced, little would remain to be desired on the part of the executive government; but as some of these Acts are permissive, not compulsory, and as others are utterly neglected, much of the benefit they might confer is lost.

Though education has done much as far as the better classes are concerned, and upwards of 200 millions have been spent on sanitary work, with great benefit to the public health, popular teaching and example, and the general diffusion of education are still necessary in order to convince the proletariat of what so intimately concerns their vital interests. The death-rate is susceptible of further diminution, expectancy of life may be enhanced, and the general conditions of living and exemption from certain forms of disease are by no means as perfect as they might be; tainted water is still drunk, as was illustrated by the condition of Maidstone and Lyme Regis last year, where an extraordinary visitation of typhoid fever was traced to impure water, showing either that legislation was imperfect or that its provisions had not been duly observed. Chimneys still vomit forth their smoke and chemical fumes, rivers are still polluted, cesspools and imperfect drains, badly constructed, ill-ventilated houses, and so on, still defy alike sanitary law and common sense; and it will perhaps not be until the more complete organisation of the public health administration under a minister of public health be effected, that the full benefits of sanitary legislation will be realised and the people attain to that standard of health and duration of life for which they have a right to hope.

Even our great cities, with all their improvements, leave much to be desired. Notwithstanding Acts of Parliament, all the efforts of sanitary authorities, all the advice that may have issued from this and other similar sources, serious defects remain. Even your own great city, according to the journals, notwithstanding the splendid municipal arrangements for which it is remarkable, has still a higher death-rate than some other great cities. Since 1882 up to 1897 it has stood at from 21·6 to 20·2, and the same authority points out sanitary defects which one may venture to think might be ameliorated.

In the first week in July in thirty-three of the largest English towns the rate of mortality, which had been 15·1 and 14·9 per thousand in the two preceding weeks, declined to 14·7. It was 14·3 in London, whilst it averaged 14·9 in the thirty-two provincial towns. The lowest death-rates were 9·4 in Cardiff, 9·7 in Huddersfield, 10·3 in Brighton. The highest rates were 17·9 in Plymouth, 20·3 in Newcastle, 21·4 in Sunderland. When the last quinquennium is compared with the preceding decennium it is found that Blackburn and Huddersfield have reduced their death-rate 4, Halifax and Cardiff 3·8, Oldham 3·7, Preston 3·4, Manchester 3·3 per thousand, while Birmingham has been practically at a stand-still. If I am not mistaken, your own eminent health officer thinks that if the death-rate is to be reduced, it is essential that the improvements should be continued which had such a good effect some years ago. I merely venture to suggest it as a hint that may be worthy of the consideration of the municipal authorities.

The Modern Part of Whitgift's Hospital of the Holy Trinity, in North End, Croydon, is to be demolished in order to improve the thoroughfare at that point. In a letter to an inquiring member of the Corporation Mr. Alderman Rymer (chairman of the Whitgift Governors) states that the modern part is in a very dilapidated and unsatisfactory condition, while the original building is "as sound as a rock." The latter will in no wise be affected by the proposed demolition, nor will any injustice be done to the almspeople.

THE AMERICAN INSTITUTE OF ARCHITECTS.

THE following draft of a revised constitution for the American Institute has been unanimously adopted and recommended as a substitute for the present constitution by the committee appointed for that purpose. Amendments to the by-laws will be brought before the convention to be held in Washington November 1, 2, 3, 1898 :—

CONSTITUTION.—*Article I.—Name.*

The corporate name of this organisation shall be "The American Institute of Architects."

Article II.—Objects.

Sec. 1. The objects of this Institute are :—To organise and unite in fellowship the architects of the United States of America, and to combine their efforts so as to promote the artistic, scientific and practical efficiency of the profession.

Article III.—Membership.

Sec. 1. The membership of the Institute shall consist of fellows, associates, corresponding and honorary members.

Sec. 2. The condition of membership shall be honourable service in the field of one of the above classes of membership, as defined in the by-laws.

Sec. 3. The title of fellow shall be granted for professional merit only.

Article IV.—Officers.

The officers of the Institute shall be a president, first and second vice-presidents, and a secretary, who shall also be treasurer ; all of whom shall be fellows. There shall be a board of directors consisting of the four above-named officers, *ex officio*, and such additional fellows as shall be prescribed by the by-laws.

Article V.—Organisation.

This Institute is an association maintaining local organisations of its members known as chapters, incorporated under the laws of the several States wherein they are established.

Article VI.—Chapters.

The president and secretary of each chapter shall be fellows or associates of the Institute.

Each chapter shall hold an annual meeting and present an annual report to the Institute.

Article VII.—Government.

Sec. 1. The government of the Institute shall be by delegates from the chapters in convention assembled, its officers and board of directors.

Sec. 2. The board of directors may, by a formal vote, delegate its powers, in whole or in part, to an executive committee chosen from its membership, stating the powers granted and a limit of time for their exercise.

Sec. 3. The board of directors shall annually elect a judiciary committee from its own membership and establish rules for its guidance. The committee shall hear and adjudge all complaints of members against members, and its findings shall be conclusive upon all questions of fact involved in the evidence submitted. Appeal in writing may be made to the board of directors upon questions of professional or ethical policy. If satisfied of the existence of newly discovered evidence material to the issue, the board may, in its discretion, recommit the case to the committee for a rehearing upon the facts ; but, save as to the existence of newly discovered evidence, the board shall hear no evidence except such as may be reported to it by the committee.

Article VIII.—Meetings.

The Institute shall hold an annual convention and such other meetings as are provided for in the by-laws.

Article IX.—Definition.

The term "State" throughout this constitution and the by-laws shall also apply to the district of Columbia and Territories.

Article X.—Amendments.

This constitution may be added to, altered or amended on the written proposition of ten or more fellows by a three-fourths vote of the delegates voting at an annual convention, provided three months previous notice of the proposed change shall have been sent by the secretary to each member of the Institute and to the secretaries of the several chapters.

PROPOSED BY-LAWS.

The following is an outline description of the proposed by-laws, and is intended in its present form both to explain the constitution and to supply the basis of amendment of the existing by-laws at the annual convention of the Institute. At that time the committee on revision will formally present them, and meanwhile will be glad of any suggestions from members of the Institute relative thereto.

Outline of the By-laws.—Membership.

All members of the Institute, as at present constituted, shall hold their present titles and membership under the new constitution. A class of associate members has been added by the constitution to the Institute organisation. It is proposed to elect fellows only from the ranks of associates, unless in special cases the board of directors otherwise determines. Associates may be elected without belonging to a chapter of the Institute, but cannot become fellows until they have joined a chapter and been members in it for two years, except that the board of directors may suspend this rule in special cases.

Applications for fellowship and associate membership shall be made according to forms printed as an appendix to the by-laws, and every chapter shall have an opportunity for an expression of opinion to the board of directors regarding the eligibility of local candidates for fellowship before the names are passed upon by the board of directors. The important question as to whether fellows shall be elected by letter-ballot, by vote at the annual convention, or by vote of board of directors, is further to be considered. Many considerations tend to make the letter-ballot desirable. The same question of election applies to associates, but in any case no election is to take place until the candidate is passed upon by the board of directors.

Associates are not eligible to serve as officers or directors, but may act as chapter delegates and perform any committee service subordinate to the official government of the Institute. Any architect of the United States is eligible to associate membership if able to submit the required proofs of his professional capacity and honourable personal standing. Those trained as architects who have become professors in architectural schools or colleges shall be eligible as fellows or associates. Fellows who have honourably retired from the profession after distinguished service or have held their fellowship for thirty consecutive years, may be made honorary fellows, retaining their privileges in the Institute without further payment of dues.

Any person who has rendered the profession valuable service and has conspicuously upheld its aims, but is not otherwise eligible for membership, may be made an honorary member. Any person fitted to critically estimate the merits of architecture or its allied arts and sciences, but is not otherwise eligible for membership, may be made a corresponding member. Honorary and corresponding members shall be nominated by the board of directors and elected by ballot of delegates at an annual convention. They shall not vote, hold office, or serve on the board of directors, and shall be exempt from dues.

Initiation Fee and Dues.

The initiation fee shall be 10 dols. for fellows and associates. The annual dues for the fellows and associates shall be 10 dols., payable within the month of January. A signed receipt of the dues so paid shall be accepted by the treasurer of any Institute chapter as 5 dols. paid on account of the chapter dues for same year. The board of directors may, for adequate cause, remit the annual dues of a member in whole or in part, reporting the gross amount of all dues so remitted at the next annual convention, but not the names of the members whose dues are remitted. The names of all members who are in arrears for the annual dues of two or more years shall be declared at the annual convention, and these members shall thereupon become liable to censure or expulsion by vote of the delegates.

Chapters.

The Institute shall encourage the formation and maintenance of chapters. The objects shall be in harmony with those of the Institute. They shall be bodies incorporated under the laws of the State wherein they are located. Five or more fellows or associates may organise to form a chapter. They shall present a copy of the proposed constitution to the board of directors, and if this is approved by the board they shall then submit attested copies of actual articles of incorporation, upon which the secretary of the Institute shall issue a certificate of chapter rights. Chapter certificates may be withdrawn upon failure of the chapter to maintain the constitution submitted in its true, intended spirit.

Desired territorial limits of each chapter shall be clearly set forth in the request for a certificate. The actual limits shall be fixed by the board of directors, acting for the general good. No certificate for a chapter embracing a whole State shall be issued in a State where there are now two or more chapters, nor shall any present State chapter be continued as such after a request is made, and favourably considered, for the establishment of a new chapter in the same State. In States where there is only one chapter any architect in the State is primarily eligible to membership in that chapter.

State Federations.

In each State where two or more chapters exist a State board shall be formed by representatives of the several chapters, as follows :—

The president and secretary of each chapter shall be

members of this board *ex officio*, and each chapter may furnish additional members to this board to the number of the delegates the chapter was privileged to send to the preceding annual convention of the Institute. The chairman of this State board shall be the president of the senior chapter of the State, and the secretary of such chapter its secretary. The State board shall meet when occasion requires, and determine its own procedure. Each such board shall be officially known as the (name of the State) federation of architects.

Chapter Membership.

Chapter membership may include others than fellows or associates of the Institute, and their membership in the chapter shall not entitle them to be regarded as members of the Institute. Chapter membership shall be divided into three classes :—Regular membership, including all practising architects who may be elected to this grade; junior membership, including draughtsmen and such architects as may not have been elected to regular membership; associate membership, including all whose affiliations render them desirable associates in the work of the chapter.

Each chapter shall have a president, secretary and treasurer, with such other officers and such committees as may be deemed desirable. The president and secretary shall be members of the Institute, either fellows or associates. The officers of the chapter shall be elected by regular members only. Delegates to Institute conventions shall be elected by Institute members only, and shall themselves be members of the Institute.

Each chapter may, with the express consent of the board of directors, adopt or retain a proper name or title other than its designation as a chapter of the Institute. Each chapter may make by-laws for its government without consulting the Institute, provided they are not inconsistent with its approved constitution and the conditions herein contained.

Delegates.

The affairs of the Institute shall be controlled by the votes of delegates sent from the chapters. The delegates shall meet in annual convention, the time and place being determined by the last preceding convention, or, in case of its failure to do so, by the board of directors.

Each chapter is entitled to two delegates, plus one for every ten fellows and associates who are members of that chapter. Thus a chapter containing nine fellows and associates is entitled to send two delegates, if containing ten fellows and associates it may send three delegates, if twenty fellows and associates four delegates, &c. The delegates of each chapter shall be duly accredited by the secretary of their chapter and the convention shall decide all questions relative to the right to sit in the convention.

All fellows and associates not delegates are privileged to sit in the convention at all times and to take part in debates and to offer resolutions or motions which, if seconded by a delegate, shall be regarded as offered by a delegate and given equal consideration, but unless so seconded shall not be entertained. Non-delegates may only vote on a proposition that "it is the sense of the meeting." The election of Institute officers shall be by the ballots of delegates at the annual conventions, a plurality vote electing.

Officers and Committees.

The officers of the Institute shall be as described in the constitution, and shall fulfil the duties ordinarily attaching to their offices. The board of directors shall consist of the four officers of the Institute required by the constitution, together with nine fellows in addition. Three of these nine directors shall be elected each successive year to serve for three years. They shall be elected by vote of delegates at the annual convention. The standing committees shall be as follows :—

House committee (which shall also serve as committee on publication and library), committee on education, committee on foreign correspondence, committee on contracts and lien laws.

THE SOUTH KENSINGTON MUSEUM.

THROUGH the generosity of Colonel R. F. Waldo-Sibthorp the South Kensington Museum has recently become possessed of a large collection of silversmiths' work, chiefly German, ranging in date from the sixteenth century to the present time. These specimens are very varied in form, and include tankards, flagons, beakers and salvers, decorated in repoussé and by engraving with flowers, scrollwork and figure-subjects ; there is also a considerable collection of spoons. Among the pieces of historical interest is a standing cup and cover surmounted by a bust of Gustavus Adolphus, king of Sweden, and with an incription in his honour. There are a number of specimens of the work of English silversmiths, the most important being two Communion cups of Queen Elizabeth's reign, one of which retains its paten-cover. The series of English spoons covers a considerable period of time ; they are interesting on account of the hall-marks, the decoration of the handles and the shapes of the bowls. The handles of some terminate in figures of Apostles, others are seal-topped, whilst others are of the plain "sleppe endyd" form. A set of tea-spoons in the form of shells with dolphin handles formerly belonged to Lord Nelson. Colonel Waldo-Sibthorp has included in his gift a small collection of snuff-boxes of the last century, two of which are specially deserving of notice. The first is of tinted gold set with diamonds and other jewels ; the second is of enamel, and has inside the lid a portrait of Peter the Great painted by Crodowiezky.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL SOCIETY.

THE fifth meeting for the year 1898 was held yesterday at Newburn, Heddon and Ryton. The members assembled at Central Station, Newcastle, at 10.30 A.M., and drove to Newburn, where the English troops, under Lord Conway, were defeated by the Scots, under General Leslie, in 1640, and examined the church, which is cruciform, with a square tower. The north aisle is of transitional date, and the south aisle Early English, and it contains some ancient monuments of the Delaval family, and stained-glass windows. They then proceeded to Heddon-on-the-Wall, where a portion of the Roman Wall still remains. The church possesses an interesting Norman chancel, and the chancel arch is enriched with a zigzag ornament of that period. From Heddon they drove by way of Wylam to Ryton, where the church was visited. The thirteenth-century nave still exhibits many original features, and the chancel retains its beautiful lancet windows on the south side. There is a stone effigy of an ecclesiastic, probably an archdeacon, of early and excellent work. All the churches visited were described by Mr. C. C. Hodges.

AN ARCHITECTURAL EXPERIMENT.

A FEW years ago, writes a correspondent ("R. A. C.") of the *Architectural Record*, a curious problem presented itself to the architectural firm of which I am a member. It was this :—An Unitarian minister but lately returned from Japan, where he had been living for the purpose of studying the civilisation of that wonderful country, required a house in the city of Fall River, Mass., a city that outwardly gives no evidence whatever of the rather unusual amount of artistic appreciation existing there. The Rev. Mr. Knapp was the possessor of a splendid store of Japanese bronzes, lacquers, porcelains, embroideries, kakemono and all the other manifestations of the extreme civilisation of "Dai Nippon." Hence arose the question, How shall these be housed ?

At first the decision was in favour of the simplest form of construction with slight "Colonial" details, but immediately the ungrammatical nature of this combination of Puritanical architecture and Oriental furnishings asserted itself, and it seemed intolerable. Suddenly the impulse arose to see what could be done with the architecture of Japan. For a time this seemed fantastic in theory and impracticable. The domestic architecture of Japan is exquisitely adapted to local conditions. Widespread poverty, seismic considerations, a gentle climate, habits of out-of-door living, lack of what we of the West consider domestic habits, have resulted in a form of habitation that seems out of touch with Western conditions. The Japanese house is practically nothing but one floor with a wide roof supported on many posts, sliding "shoji" or screens of rice-paper serving to divide it into an indefinite number of rooms of no fixed size, though always some multiple of 3 feet on one side, of 6 feet on the other ; this being the unchangeable size of the thick mats of finest straw that cover the floors. There are no fireplaces, few stairways, few windows—in our sense of the term. Moreover, a Japanese house is bare of all decoration except for the kakemono hanging in the tokonoma, with its bronze or porcelain jar in front holding a spray of blossoms, and the two or three bits of cloisonné, ivory or bronze, in the adjoining chig-i-dana. The vast stores of precious objects owned by the Japanese collectors are always kept in a godown, one or two being brought out every day for the delight of the owner. In the present case this course could not be followed. We cannot get rid of our western and most barbaric desire to surround ourselves with quantities of gorgeous objects, and for this reason, even if climatic conditions were overcome, it was impossible to create absolutely Japanese rooms, if they were at once to lose their whole effect of gentle delicacy and dignified reserve by being crowded with works of art.

It seemed, however, that there should be some middle course which would result in an interior that might possess the element of unity and yet be practical and without affectation ; this working basis was at last found.

The experiment was made on the following lines :—In plan and construction the house was to be absolutely western, arranged for convenience and habitability ; all the details, both exterior and interior, were to be studied faithfully from Japanese examples, paint, wood stain and varnish being unknown in the East, as well as particularly vulgar and hideous, were excluded. Plaster also was largely omitted in the finish of the rooms, and natural woods of twenty different kinds, selected for their colour, surface and veining were used instead. The exterior showed beam construction with the intervening spaces filled in with cement in the Japanese fashion. Finally, at one corner of the house was arranged a section absolutely Japanese in design, construction and finishing, and around this lay the little garden designed on the most approved lines, with its miniature mountains, valleys and plains, its lake and cataract, its forest of dwarf trees.

To read of a scheme of this kind gives one an idea of unmitigated affectation ; the whole thing seems like a toy house, a thing in which one could not live comfortably or with self-respect unless clothed with kimono, obi and tabii. One would say "this is a silly pose."

In actual fact it was none of these things. People came to wonder, and went away convinced, while to those most interested the experiment has justified itself absolutely. The house was rational and liveable. Nor was this due to its western elements. The "tea house" was built more or less as an amusement ; no one ever expected it could be used except in summer, and then only as a tea house or garden shelter. Instead it was by far the most charming part of the whole structure ; the coolest in summer, the warmest in winter. In a little while the westernism of the main house became distasteful, and the tea house with its sliding rice-paper shoji, its matted floor, its lack of all confusion, its very bareness became irresistible, and instead of serving as a summer house it became the principal living room. Then the owner realised that he (his architects) had been too cautious, and declared that if he were to build again it would be more closely still to the Japanese principles.

All this seems to show that there is something in Japanese domestic architecture which is good apart from its perfect adaptation to Oriental conditions, something that could be advantageously adopted in western building. This thing is certainly simplicity. If we compare the view of the interior of the tea house with that of the parlour, the effect improves the farther one gets from western suggestions? Contemporary domestic architecture is a riot of complication and over-detail, without reserve, quiet or dignity. Its outward forms are borrowed from stone construction, its bad workmanship is daubed over with coats of paint ; wood, in its natural state a material of exquisite beauty, is tortured and hacked into grotesque forms, stained with muddy dyes and smeared with paint and varnish. Windows are filled with single sheets of plate glass until all sense of protection is gone. Walls are covered with gaudy paper-hangings and then loaded with crowded pictures. Our living rooms are turned into junk shops, while the house itself from the exterior looks like nothing ever seen before in the history of art.

Compare any typical "parlour" of the present day with a corresponding Japanese room—that in the "tea house," for instance, which is simply a copy, and for which the architects are to receive neither praise nor condemnation. The posts and frames are of cypress, innocent of stain or varnish, and with a surface like satin. The lattice of the shoji is white pine, the coverings rice-paper. The ceiling is of strips of cedar filled in with long thin boards from Japan of a marvellous wood with dark veins ; the pierced carvings in the screen between the two rooms are also from Japan, and are of cryptomeria wood. In the chig-i-dana apple, cedar and cypress are used. The floor is covered with straw matting, and the only decoration is in the shape of a kakemono, a bronze jar, two pieces of cloisonné and a bit of lacquer. It would be impossible to imagine anything more quiet and delicate than the effect of this room either in winter when the shoji are drawn and it is full of a soft, diffused light, or in summer when they are run back and two sides are open to the fresh air, on one side lying the fantastic little garden, on the other the distant river with the meadows beyond.

That this form of construction and style of decoration is absolutely fitted for certain of our purposes is evident. Nothing could be imagined that would adapt itself so delicately to seaside architecture, and in cost quite as well as in other ways. A house on Japanese lines could be built for summer use of the most beautiful woods, and adequately furnished for half what is expended now for a Queen Anne or Colonial horror doomed to most desirable decay. One of the greatest surprises in connection with the house in question was its cost. It is finished in the most beautiful woods—cedar, sycamore, cypress, apple-tree, white mahogany, curly maple, black cypress, birch, as well as many brought from Japan ; inside it is one piece of fine cabinet-work from top to bottom, and yet it cost less than a "Colonial" house of the same size would have done.

For serious purposes, for permanent habitations in the country for instance, the style would hardly be admissible in its entirety, but a study of its nature, better still, an attempt to work in it, cannot fail to show the absurdity of some of our modern customs. We build constantly in wood, but we show no appreciation whatever of this material ; we can't let it alone, but are impelled to try to make it look like something it is not by the use of paint, stains and varnish. The Japanese understand it perfectly and their houses are marvels of beauty, just because they make of each post, each beam, a thing to admire by reason of the natural beauty of its grain, colour and texture. Here in America we have a great variety of exceedingly beautiful woods, if we can be content to use them in their natural state. American oak is not a fine wood and there is no very good mahogany in the market, but we use these *ad nauseam*, quite ignorant of the fact that white pine, sycamore, gum wood, birch, maple, cedar, Canadian elm, and, above all, black cypress, are incomparably more beautiful. One of the ceilings of Mr. Knapp's house was of cypress and white mahogany, and the colour effect was singularly beautiful. The hall was finished wholly in wide plain boards of black cypress wonderfully veined and perfect in colour—the delight of all the Japanese, who declared it equal to anything their own country could offer.

Another lesson to be learned is that windows are in most cases to admit light, not to afford a view of what is without. In our vaingloriousness over plate-glass we fill every opening with it, whether there is anything to be seen from the window or not. The Japanese are wiser ; they furnish sliding paper screens that admit the softest, most delicate light imaginable, and when they wish to enjoy the view without, move them to one side. Between a great shapeless window filled with a sheet of glass, and then half hidden by voluminous draperies, and a Japanese window shoji with its delicate network of dark lines against the pearly rice-paper, there is just the difference between barbarism and civilisation.

There are many things of this nature that one may learn from Japanese architecture, but if nothing was acquired but a sense of the sanctity of wood and the beauty of fine workmanship, the study would be worth while.

It is possible to write of this experiment now, for in a measure it is a thing of the past ; the owner has found it impossible to live in the West after a taste of Eastern civilisation, and is now a citizen of Tokio. The house is dismantled of all its treasures, the rooms are empty, the little garden is running wild, and the bare shell alone remains, a forlorn relic of a delightful attempt to graft an alien civilisation on a tree grown rank with too vigorous life and already showing signs of decay.

GENERAL.

The Exhibition at the Birmingham Art Gallery of pictures by artists of the modern French school, many of which were at the recent exhibition at the Guildhall, has been visited during the first week by 29,420 persons.

Sir Walter Parratt, organist of St. George's, Windsor, speaking at the Church Congress on Wednesday, said that organs were becoming too large. Everything that was desirable could be obtained from an organ of fifty sounding stops. These unwieldy organs were hard to manage, outrageously expensive and difficult to keep in order. He condemned organ chambers as organ tombs, which destroyed the effect of the more delicate stops. There ought to be speaking space for the instrument. The organ should be kept in one piece. He wished that a full half of the sums usually spent on organs were spent in promoting the efficiency of our choirs.

The Mercers' Company have sent one hundred guineas to the fund for the restoration of Peterborough Cathedral.

A Statue of Jean François Millet was unveiled at Gréville on Sunday last. The painter was born near the town in 1814. The statue is the work of M. Marcel Jacques.

Mr. Alexander Koch is now publishing an art journal in Darmstadt, which is called *Deutsche Kunst und Dekoration.* The new number contains a great many illustrations of German work in various styles.

Messrs. S. B. Bolas & Co. have received an order from the Baker Street and Waterloo Electric Railway to photograph every building above the line of route. It is calculated that 1,500 separate negatives will be necessary, and each will include two houses. This series is practically a form of insurance against claims for damage that might be made by owners of property above the line of railway, after the railway commences running, and if such cases should occur, the negatives in question will be of the greatest possible value as evidence. Six operators are engaged on the work from morning to night whenever the weather and other conditions are suitable.

The Cost of the building for the Glasgow International Exhibition of 1901 is estimated at 57,000*l.*, and the Grand Hall at 16,000*l.* The material employed for the structure will be steel and fibrous plaster.

THE
Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

Architects' estimate	865 0 0

THE new Llangollen county schools, which have been erected by Mr. W. H. Thomas, builder, Oswestry, from the designs of Mr. H. Teather, architect, of Cardiff and Shrewsbury, were formally opened last week. They provide sufficient accommodation for 120 students—70 boys and 50 girls—and have been arranged in the most convenient manner, the greatest attention being paid even to the smallest details. On the ground floor are the assembly hall, which is separated from the adjoining classrooms by patent sliding partitions, science lecture-room, laboratory, workshop, cookery, laundry, headmaster's room, together with cloak and lavatory accommodation. The total cost of the land has been 1,270*l.*, of the building 4,040*l.*, and the extra furniture needed has cost 200*l.*, or in all 5,510*l.*

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office: 175 Strand, London, W.C.

BUILDING AND BUILDERS.

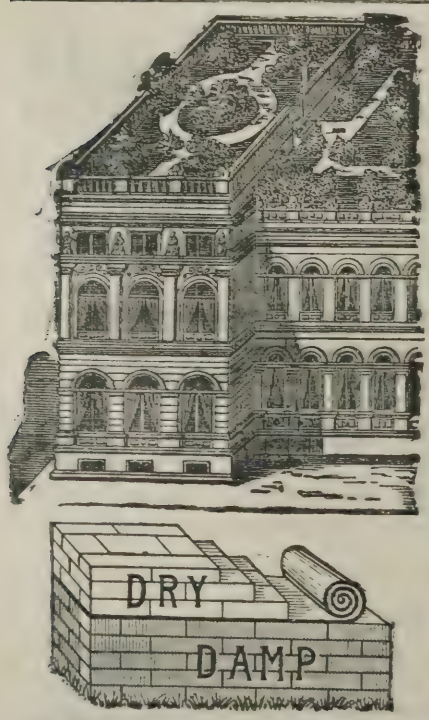
THE contract for the new premises of the London and Midland Bank, situate in North Street, Leeds, has been let to Messrs. Craven & Umpleby. The work is being carried out from the plans and under the supervision of Mr. William Bakewell.

THE reconstruction of the sea wall and promenade at Herne Bay, which were so extensively damaged in the destructive gales of last November, is to be proceeded with at once, the estimated cost being placed by Mr. Baldwin Latham at 40,000*l.*

ANOTHER section of the Birmingham Waterworks, viz. from Cleobury Mortimer to Hagley, has been let to Messrs. Morrison & Mason, Limited, of Glasgow, at 412,445*l.* 19*s.* 5*d.* Messrs. Morrison & Mason are already the contractors for three sections of the aqueduct, and the new contract places the continuous length from Dolau to Hagley—a total of 51¼ miles—in their hands. The aqueduct over contract No. 12 is all in pipes or syphon, and includes the bridges over the Severn and Stour.

A REMARKABLE accident occurred at some buildings being erected off Brompton Road, London, on the 21st inst. A labourer named Joseph Walker was at work on a scaffold, 60 feet high, when in stepping backward he slipped and fell. His comrades thought it meant instant death, but Walker dropped on a platform beneath, and, not losing his presence of mind, clutched the edge of the stage, and succeeded in raising himself and escaping without injury.

ON September 28 the sixth quinquennial festival of the Royal Albert Asylum, Lancaster, was held, and advantage was taken of the occasion for the laying, by Sir John Hibbert, in the absence of Lord Derby, of the foundation-stone of the new wing. This will be erected at the south-east angle of the Brooke wing, and is intended to provide accommodation for young imbeciles who develop epilepsy. Costing about 15,000*l.*, every effort has been made to give the most scientific provision for the unfortunates who will be housed here to the number of about 100. While this extension will thus give facilities for the greater comfort and better treatment of the epileptic and feeble, it will at the same time relieve the main building to some extent of the pressure put upon it by the influx of ordinary patients.



THE negotiations which have been in progress for some time past with a view to the incorporation of North-East London Institute at Hackney Downs as the nucleus of the Hackney Polytechnic, which is to be on that site, will probably shortly be brought to a successful issue. The buildings will be in connection with the share of what is known as the Sir John Cass Charity, which was allotted to Hackney after much controversy, and it is anticipated that within a few weeks the Charity Commissioners will formally ratify this scheme, giving effect to the proposal. Under the provisions of this scheme the institute will be continued as the centre for practical and theoretical instruction in natural and experimental science and artistic crafts, whilst trade and handicraft classes will be conducted as usual at South Hackney under the auspices of the Technical Education Board of the London County Council.

THE successful architect for the new constabulary offices, police and coroner's court, to be erected on the site of the old barracks in Arpley Street, is Mr. R. Burns Dick, 55 Northumberland Street, Newcastle-on-Tyne. A short time ago eighteen competitive designs were sent in from various parts of the country, and Mr. Dick is, according to arrangement, entitled to the sum of 100*l.*, but the committee have decided to recommend him as the architect, and he will, therefore, superintend the carrying out of his own plans. Mr. Bennett, president of the Manchester Society of Architects, was appointed assessor. The second premiated design is that of Messrs. Tapper & Crouch, architects, 12 Gray's Inn Square, London, who receive 50*l.*; whilst the third design is that of Mr. J. Lane Fox, Bond Street, Dewsbury, who is awarded 25*l.* The plans will be open for public inspection to-day and to-morrow.

A NEW Baptist church is to be erected at the south-east corner of Dewar Street and Woodhead Street, Dumfermline, from plans prepared by Mr. Andrew Scobie, architect, of that place. The Gothic style of architecture has been adopted and the design is of a chaste and elegant character. The church will be seated for over 400 persons. The building is planned in such a way that side and end galleries can be conveniently erected when these are required. The main entrance will be from Woodhead Street, and the pulpit and baptistery are to be situated at the west end of the building. There will be a vestry and two retiring-rooms at the back. The retiring-rooms are to be divided by a sliding partition, so that they can be converted into one large room for the use of the Bible class or Sunday school. The church is to be heated by hot-water pipes on the low-pressure system. The cost of the building is not expected to exceed between 1,600*l.* and 1,700*l.*

LAST week the members of the Cardiff Corporation paid a visit of inspection to Cathays Park for the purpose of finally

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

determining the exact sites of the projected new Town Hall and Law Courts. Mr. Harpur, the borough engineer, accompanied the members, explaining the sites as staked out by lines of flags, while the architect (Mr. Lanchester) also waited upon the members with the necessary sketches. As the result of the inspection the buildings will occupy the sites as shown on the plans, with the modification that they will both be placed nearer the avenue of trees. This will have the effect of removing the Law Courts a little further away from the noise of the traffic on the North Road, and on the other side will leave a space between the side of the municipal buildings and Park Place of about 100 yards, allowing room for a good 50 feet roadway and the erection of another building, probably a museum. The architects were also directed to proceed with the preparation of the working drawings—an indispensable preliminary to the erection of the buildings—the Council thus finally approving of the additions and modifications previously suggested by Mr. Lanchester, increasing the original estimated cost from approximately 198,000*l.* to 233,000*l.* The increase will be chiefly absorbed in the cost of giving the buildings a higher elevation, the remainder being for a few additional offices. Both the Town Hall and Law Courts will be facing Queen Street, their frontages being roughly in a line with the canal lock, separated from one another by the existing avenue of trees, and having in front an open space, bounded on the Queen Street end by a broad roadway of 60 feet or more in width, crossing from North Road to Park Place.

THE foundation-stone of the Nurses' Home, which is in course of erection at Gartloch for the Glasgow District Lunacy Board, has been laid. The building will accommodate about sixty, and is to be of three storeys and built of red stone in the François Premier style of architecture, similar to the main asylum buildings. It is quite detached from the asylum, and situated at a rather lower level in a pleasant part of the grounds. On each floor will be sitting-rooms, bedrooms and bathrooms, while in addition on the ground floor will be matron's rooms, visitors' rooms and kitchen. A sick room for invalided nurses will be found on the first floor. To insure quiet for the night nurses, their quarters, reached by a separate staircase, have been placed in the top flat. The bedrooms will be of two sizes, and every nurse and servant will have a separate room, in addition to sharing with others a parlour. On each floor will be a small kitchen, but the nurses will continue to take their meals in the messrooms in the asylum and hospital. The entrance to the home is placed so as to be equally convenient for asylum and hospital, and opening from it on one side is a parcel and inquiry room. The parlours, which have large bow windows, are placed at the corners, and the lavatories and bathrooms are in the wings. The ground behind, forming part of the old pleasaunce, will be laid out for nurses' recreation, and the situation of the home among old trees is a very fine one. The architects are Messrs. Thomson & Sandilands, and the contractors:—Masons, Messrs. Paterson & Baldie; joiners, Messrs. Hutchison & Grant; slaters, Messrs. A. M. Ross & Sons; plasterer, Mr. Mackenzie; plumber, Mr. J. L. Arnot; painters, Messrs. M'Culloch. The total cost, including furnishings, it is estimated will be about 20,000*l.*

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester stoves to the West End Hospital, London, W.

MESSRS. SCUPHAM & SONS, LIMITED, of Leeds, are bringing out some very pretty patterns of carved door furniture and finger-plates to match. These are very effective, and sure to be in great demand for better class villa property. They are made in oak, ebony and cocus and ambowood.

THE dials of the great clock of St. Paul's Cathedral are having new skeleton iron centres put in. When the clock was erected some five years ago the centres were filled with white glass for illumination at night, but the lights were never set behind, and it is now thought better to revert to the old design. The work is being carried out by the makers of the clock, Messrs. John Smith & Sons, Midland Clock Works, Derby.

THE *New Penny Magazine* is the title of Messrs. Cassell & Co.'s new weekly periodical, of which the first number is to appear on October 19. It will provide a greater amount of reading matter and illustrations than has been hitherto given for a penny in any magazine. Each issue is to contain sixty-four large pages, fully illustrated.

A BAZAAR in aid of the building fund of the South Place Ethical Society will be held at the South Place Institute, South Place, Finsbury, E.C., on Wednesday, November 16 next, and the two following days.

ELECTRIC NOTES.

THE Brighton Town Council are about to spend 56,300*l.* on the development of their electric-light undertaking. The sanction of the Local Government Board had been asked for the borrowing of the loan, and at the Pavilion Mr. W. A. Duckat, one of the Local Government Board inspectors, conducted an inquiry into the application, when the town clerk, Mr. F. J. Tillstone, said that this was a larger sum than the Corporation had borrowed of late. This arose from the fact that the Local Government Board had asked that the loans should be applied for before the expenditure was actually incurred. Under the circumstances, the Corporation were now asking for an amount which would probably cover the expenditure for two years, namely, the current year and 1899. Thus it was about double the amount they would otherwise have asked for. Of the 56,300*l.*, the sum of 21,000*l.* was required for four dynamos, whilst the bulk of the remainder was needed for distributing mains, house service supplies and meters. The total debt on the electricity undertaking was 206,076*l.* In addition there was an amount of 11,246*l.* of a loan which had been sanctioned but not yet taken up. So that the total liabilities amounted to 217,502*l.* Mr. Wright, the electrical engineer, presented the last year's balance-sheet, and explained that they expected to add 450 customers a year for at least the next two years. They were now providing sufficient capital to meet that extension of the business. Documents giving particulars of the expenditure were handed in, and the inspector intimated that he would go into the details with Mr. Wright at the generating station.

AT a meeting of the electric-light committee of the Inverness Town Council last week a report was submitted by a southern expert on the question of introducing the electric light into Inverness under municipal auspices. It was favourable to a scheme whereby the water of the Caledonian Canal could be utilised, it being calculated that a fall of 30 feet can be obtained within a short distance of the town. He recommends the provision of 500 horse-power to begin with, which he thinks could maintain 5,000 lamps of 16 candle-power each. There is little doubt, the reporter adds, that the Caledonian Canal Commissioners would sanction the use of a much larger water-power if at any future time it was desired to extend the light, and that without producing an undue velocity of water in the canal, the latter point being one which has given rise to considerable discussion among local experts. It is estimated that for an annual payment of 600*l.* water to produce 500 horse-power could be obtained from the canal. The committee considered the latter estimate rather high, but agreed to defer consideration of the whole scheme until a future meeting.

THE mayor of Hythe, Alderman H. T. Cobay, presided at the meeting of the Council in committee to consider the desirability of applying for a provisional order for electric lighting. The Mayor having been informed that the cost of an electric-lighting provisional order would be 500*l.*, after some discussion, said the best thing to do that evening, he thought, was to recommend the Council to take steps to obtain a provisional order.

VARIETIES.

THE new burgh police offices erected in Sturrock Street, Kilmarnock, were formally opened on Thursday, the 22nd, in presence of the members of the Town Council and others. The building, which is in the French Renaissance style, includes Court hall and the various offices, with sixteen police cells.

THE Free Methodist College in Victoria Park, Manchester, was reopened on the 23rd inst., after additions and alterations. The addition made to the college increases the accommodation from that sufficient for sixteen students to that for twenty-four, and its immediate cost amounts to 3,000*l.*

A PUBLIC hall, which has been erected for the use of the inhabitants of Lochgoilhead, N.B., and neighbourhood, was formally opened on the 23rd inst. The hall is situated at the north end of the village, and has accesses from the shore road

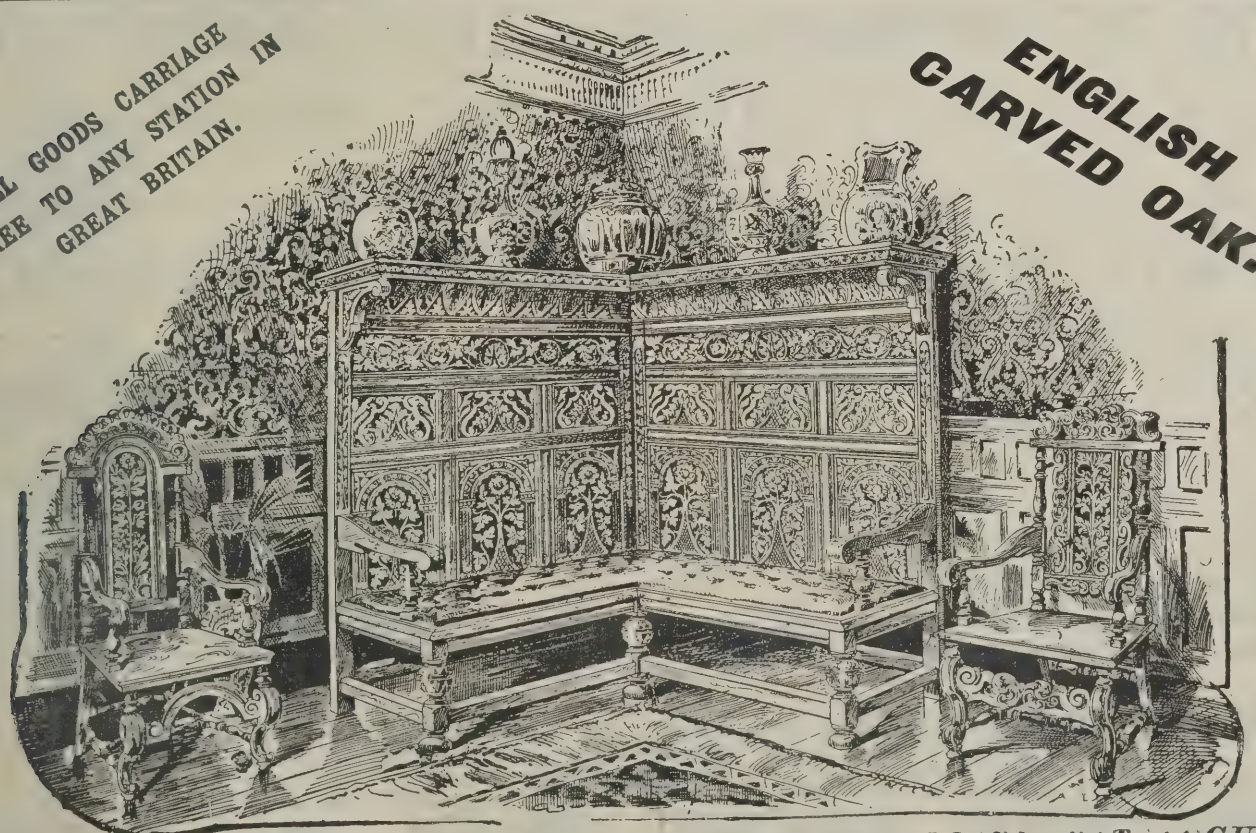
and the Inveronich road. It is a picturesque building, with spacious verandah and wide overhanging eaves, built of brick and rough cast, with panelled walls, after the fashion of an old English frame house. It contains a large hall, capable of seating 200 persons, a library and caretaker's room, and an office for the collector of rates. The architects were Messrs. James Salmon & Son, Glasgow. The total cost is 900*l.*

THE curious way in which the parishes of the City run one into another is often the subject of remark. How many, however, are aware, says the *City Press*, that one building alone—11 Queen Victoria Street—is in no fewer than six parishes. There are several instances of a building being in four parishes and at least one house is half in the City and half beyond its borders.

ONE of the most beautiful works which has come under our notice is that on "Hungarian Industrial Art," by Joseph Szterenyi. The volume in question, which is composed of various serials which have appeared from time to time, contains most elaborate and highly artistically coloured plates, sketches and designs concerning the different industries in wood, iron and metal and the textile and clay industries, to which appropriate descriptions are appended. The object of this production is the encouragement of the inventive and artistic style and design of Hungarian industries, and with a view to encourage this the Hungarian Minister of Commerce has at intervals offered prizes for competition. This volume, ably edited by Mr. Joseph Szterenyi, contains all the specimens which have gained awards in these competitions, and will prove most useful and instructive, not only to manufacturers, but to every amateur who is interested in the progress of art in its various branches and phases.



THE ancient parish church at Ockbrook, near Borrowash, was reopened on Sunday after having been closed for a period of some twenty weeks. It was through the generosity of Mr E. Elsey, of Hopwell Hall, that the renovation has taken place. The fabric itself has not been touched, but in the interior there has been a complete renovation, including reseating, reflooring with concrete over the vaults, a new pulpit exquisitely designed, and the whole of the chancel has been refurnished, new candelabra have been provided, and there is a general renewal, the organ having been also enlarged by four additional stops. One noticeable fact in connection with this restoration is that the relatives of the Rev. Lewis Lewis (vicar of the parish) have been for years closely connected with church restorations. The father of the present vicar was vicar of Cwmyoy, and when he died his brother was given the living. That brother restored Llanthony Abbey, but some time afterwards, and another brother, the rector of an adjoining parish, succeeded him, but before he left Waterstone, Herefordshire, he restored his own church.

ST. PATRICK'S CHURCH, Shieldmuir, Wishaw, was opened on Sunday last. The new building is a handsome and commodious structure, its seating capacity being about 1,000. Designed in the Early Decorated style, the building consists of chancel, nave, side chapels, aisles, baptistery, sacristies, confessionals, &c. The nave, which is 97 feet long and 28 feet wide, is divided into seven bays, and is effectively lighted. The chancel, apsidal in form, is divided from the nave by a chancel arch, and from numerous windows a brilliant light is thrown upon the altar. A feature of the church is the façade, in which are placed two handsome doors, which are deeply arched and recessed. In the centre of the gable is placed a niche containing a statue of St. Patrick. Between the buttresses are two arched recesses, 39 feet in height, and in these are placed two four-light windows. The gable terminates with a stone cross. The internal length of the church is 125 feet long, 58 feet in width, and the internal height 58 feet. Red sandstone is used in the construction of the building, and the estimated cost is 6,250*l.*

THE ancient parish church of All Saints, Ryther, near Cawood, which has recently been restored, was reopened on the 22nd inst. by the Archbishop of York. The church is very ancient, and its styles of architecture still to be seen are Saxon, Norman, Early English and Decorated, and the chancel arch, which formed part of the church existing at the time of the Domesday survey is especially interesting. In the church are five of perhaps as interesting monuments as are to be found in any church in the county, two of them furnishing examples of the armour, and two patterns of the ladies' dresses, of about the period 1300 to 1520. The church, though simple in style, has in former years had beauty and merit of its own. It was, however, about 120 years ago sadly defaced by being covered with an unsightly one-span roof and a ceiling, and until its restoration was commenced in February last, the church was most grievously out of repair, while the monuments it contained were, owing to the damp, rapidly decaying. The parishioners have for some time been making efforts to restore their church, and in January a committee was appointed to carry out the work, which, it is estimated, will cost about 1,400*l.* The principal work of restoration already effected are the new roofs, and the church has received attention generally.

ALTHOUGH the partial restoration of Linlithgow Church has been completed, repairs on particular parts of the building are still in progress. The most recent of them has been the restoration of the mullions and tracery of the west window, the architectural features of which are very striking. The mullions have for many years been in a dilapidated condition, and have been somewhat unseemly because of the amount of cement employed to fill up the broken or decayed portions. In consequence of their condition complaints as to draughts were frequent. The decayed mullions have now been replaced by others which are exactly similar in size and design, and which have been so prepared as to admit of double glass being fitted into them. The result will be an amount of comfort to which those sitting in the west end of the church have not hitherto been accustomed. The window, the stonework of which has thus been restored, has been filled with stained-glass representing the transfiguration of our Lord. This is the third stained window which has been placed in the church since the general restoration, and we learn that another is promised. The window is erected to the memory of the late John Miller Richard of Clarendon, and it consists of six large figures. Of these the central is the Saviour, having on the right Moses and on the left Elias. In the lower division are figures of Peter, James and John. The general effect produced by the window is very striking. The colours are rich and beautiful, and the prominent position the window occupies makes it a marked feature of the church.

AN important addition to the Birmingham Homœopathic Hospital buildings in Easy Row has just been opened. It is the first instalment of a series of extensions and improvements, for which a building fund of 4,300*l.* has been raised. It is proposed to extend the hospital itself, replacing the remainder of the old frontage in Easy Row with an elevation similar to that of the new part. The old part, which was originally a factory, will be taken down and rebuilt, with a view to completing the hospital as a thoroughly efficient institution on modern lines. The portion now opened is an extension of the small block at the rear. This building was originally intended for an isolation hospital, but as the municipal authorities now deal with infectious cases it has been utilised for a nurses' home. The extension, the building and furnishing of which have cost 700*l.*, provides five additional bedrooms and a nurses' parlour. This will enable the hospital to maintain altogether eighteen nurses, thereby increasing the number available for out-nursing. The future extensions will include the provision of two wards to enable the hospital to deal with accidents and other casualties. This will bring the accommodation for patients to fifty beds. In the out-patient department, for which improved accommodation has already been provided, some 1,200 to 1,500 patients are treated per month.

THE Oxford Place Chapel, Leeds, which has been subjected to structural alterations which amount, practically, to a complete rebuilding of the exterior, was reopened on the 22nd inst. The low situation, as compared with the artificially raised ground upon which the Town Hall is built, presented a serious difficulty to the joint architects, Mr. George F. Danby and Mr. William H. Thorp. If funds had permitted of the erection of an entirely new structure the chapel building would have been raised to a considerable height, with the floor elevated on a basement stage; but designs with this object in view had to be abandoned on account of the extra cost. The architects, however, have minimised the disadvantage of the lowness of the site. The old boundary wall and entrance gates have been swept away, the ground floor raised 15 inches and a flight of steps constructed across the whole of the chapel front, giving access to the main and also to the two side entrances. The building has been carried up to an additional height of about 24 feet from the main entrance level by means of a central pedimented gable, and cupolas at either side crowning corner pavilions. The leading features of the front consist of a rusticated ground-floor stage with piers, banded alternately with brick and stone ashlar work, marking the angles of the corner pavilions and the central gable; a bold projecting central porch, with a segmental arched canopy carried on rusticated piers and coupled Ionic columns; and two square-headed side entrances with circular fanlights and carved spandrels. The upper first-floor stage is embellished by coupled and single columns, with richly-carved composite capitals of a Renaissance character carrying bold, well-moulded entablature, with a projecting cornice displaying modillions. A three-light window in the central gable is surmounted above the cornice level by a moulded, rusticated arch, the tympanum of which is filled in with a moulded circular light and carved side panels. The cupolas crowning the angle pavilions and flanking the central gable, spring from angle pedestals with carved scroll terminals, and have semicircular arched faces with angle columns capped by moulded cornices and with stone dome-shaped roofs. In the interior a bright, cheerful effect has been aimed at. The walls and ceilings have been treated in light shades of colour. The ceiling is divided by moulded ribs into panels, having stencilled orna-

mental borders. The walls are of a pale terra-cotta colour, and have a frieze of running scroll and cartouches in greys, greens and browns, on a saffron-yellow ground. Round the windows on the first floor is a painted architrave border, and over them is a treatment of festoons. The gallery front has an ornament of scrolls and festoons of a subdued green ground, the mouldings enriched in colour and gold. The windows on the ground floor are treated with an architrave border, and are surmounted by cartouches. There are stained-glass windows, glazed with cathedral glass, having the lunettes filled in with ornament, and with an ornamental border of Renaissance design. The glass has a light silvery effect, and the ornament is in golden yellow, shaded with silver-grey. Electricity is employed for the lighting of the interior.

METROPOLITAN TABERNACLE.

THE rebuilding committee in their report state that Messrs. Searle & Hayes, architects, of Ludgate Hill, were called in by the trustees to assist in connection with the fire claims, and had successfully negotiated with the insurance offices for the payment of the full amount of the policies—in all, 22,000*l.* After due deliberation the committee decided to entrust the preparation of plans and the supervision of the work to this firm. Messrs. Higgs & Hill, Limited, were then commissioned to prepare the basement for public worship in accordance with the unanimous vote of the church, and the committee are glad to report that the work is being carried out in the most efficient manner. It is hoped that the basement will be ready for occupation in November.

In deliberating upon the several schemes for rebuilding the tabernacle, the committee have given prominence to the following important considerations :—

1. That the building must worthily perpetuate the memory of the founder.

2. That it must meet the requirements of modern times and be suitable for society anniversaries as well as the regular services of the Sabbath.

3. That any scheme adopted must give effect to the pastor's suggestion that he and his hearers be brought into closer proximity with each other.

Briefly summarised, the scheme adopted comprises the following :—The portico and walls left by the fire are retained, and will be repaired. The construction will, as far as possible, be fireproof, much of the material that was previously wood being replaced by iron. The auditorium will be of the same width as before, but the length will be reduced to the extent of one bay, which is equal to about 13 feet 6 inches. This reduced length, while it enables the pastor to get nearer to the audience, and, as the committee believe, improves the proportions of the building, also gives opportunity to add to the number and size of the vestries, and to provide commodious baptizing-rooms. The committee have not found it either necessary or advisable to omit the upper gallery. The total seating capacity will be reduced by about 1,000. The heating will be by means of radiators. There will be electric light throughout, with reserve gas supply in the roof and at the entrances, in case of accident. The seats will be more commodious than in the old building, and the aisles will be wider. The exits will be improved, and the committee are negotiating for the hire of a narrow strip of land at the north side of the tabernacle in order to widen the outside passage.

The working drawings for the whole of the structure have now been prepared, and the architects will at once proceed to take out the quantities. Several weeks will, however, elapse before the committee are prepared to invite tenders.

FRENCH CONVALESCENT HOME, KEMP TOWN.

THE French Convalescent Home in De Courcel Road, which was opened for public inspection last Friday and Saturday, is connected with the French Hospital, Shaftesbury Avenue, London, and will be conducted by the Sisters of the Sacred Heart.

The building, seen from the outside, has a very pleasant appearance. It is built of red brick, which gives it a very warm and cosy appearance, while the large and numerous windows that break the surface of its walls give promise of excellent light and ventilation within. The rear of the building, which faces the sea, is separated from the highway by a garden, which is still in course of arrangement. The interior of the building is an excellent study for the philanthropist, for it combines the two extremes of the greatest comfort and the greatest simplicity. Electric lighting is to be found in every room, bathrooms are on every floor, the beds have castors with rubber tyres, hot and cold water taps are to be found in every bedroom, and the whole building is warmed by hot-water pipes.

Wall-papers and wooden floors are nowhere to be found, marble and dead-looking paint taking their place, so that neither dirt nor disease can possibly find a lodging.

In the basement are the kitchen, two large sitting-rooms for the use of the men and women respectively, a dining-room, the Sisters' refectory, a pantry, wine-cellar, and a man-servant's room. The kitchen, which is a model of neatness, is fitted with a large gas cooking range, which will cook the dinners of the whole of the thirty-two inmates and of the staff of Sisters and servants. The two sitting-rooms are simply furnished, but have a pleasant outlook on the garden at the seaward side, the south wall of each room being almost entirely cut away to make room for the large French windows. On the next floor is the entrance hall, the lady superior's parlour, the doctor's sitting-room, a small chapel and bedrooms for the old people. The chapel is a small room on the eastern side of the building. A prettily flower-decorated altar, bearing a small crucifix, has been erected in front of a recess, lit by a red-stained window. At the end of the corridor on this floor is the isolation-room for any case of infectious disease. The old men's and old women's bedrooms each contain a large wardrobe, while an easily-moved locker stands by the side of each bed. The women's room also looks out over the sea, and the windows open on a stone balcony.

On the third floor are the lady superior's and doctor's bedrooms, rooms for the convalescent men and women, and the sisters' suite of rooms. The bedrooms are almost identical with those on the lower floor. The top floor contains only the servants' bedrooms, a lumber-room and another bathroom. Altogether there are beds for thirty-two inmates, ten of which are for old women and six for old men.

ABBEY MANSIONS.

ON the 19th inst., under the dangerous structure clauses of the London Building Act of 1894 and the Amendment Act of 1898, a summons was heard before Mr. Marsham, at the Westminster Police Court, which was addressed to the owners of the building known as Abbey Mansions (North Block), requiring them to take down the cracked and defective portions of the stonework of the angle turret at the corner of Victoria Street and Orchard Street Mr. F. F. Daldy, instructed by Mr. Seager Berry, appeared for the London County Council, and Mr. Pollard defended.

Mr. Daldy said the building was now in a very dangerous state, and something must be done, though the County Council had been placed in a great difficulty by the previous decision of the Court—under appeal—that the building was vested in and in the occupation of the Crown. The County Council had been in communication with the Government, and Sir John Taylor, consulting engineer to the Commissioners of Works, would tell the Court the present position of affairs.

Mr. Marsham: Supposing it is Crown property, or vested in the Crown, do you say that a magistrate has no power?

Mr. Daldy: No, sir; it is exempt.

Mr. Marsham thought it a pity that what was necessary for the public safety could not be done at once, and the question of liability decided afterwards.

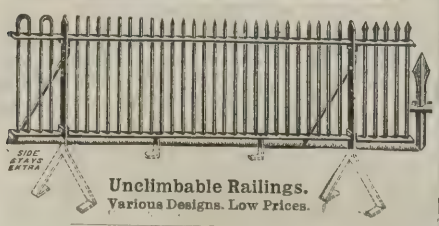
Mr. Daldy said that there had been a promise to strengthen the defective part of the building with steel bands, but only one band had been put up.

Mr. Pollock Marshall said that five steel bands would be in position in a few days. Mr. Pawley, the owner, while not admitting any obligation, was doing everything he could.

Mr. D. Drury, district surveyor, called by the prosecution to testify as to the present condition of the building, said that the cracks in the brickwork were widening. He considered that the stonework of the turret was moving and the cracks all developing. The indications showed the possibility of a very serious accident. On September 14 there was a piece of stone nearly falling from the front of the building.

Mr. Daldy: In your judgment is it necessary for the safety of the public that this building should be shored up at once?

Witness: I certainly think so. The cracks have extended considerably since the 19th. I think the second floor of the building is in a very critical condition.



Mr. Daldy: Assuming that five steel bands are put up, and taking into account what you have seen, would you be satisfied with the bands?—After my inspection this morning I am of opinion that the steel bands would not suffice.

Cross-examined, Mr. Drury said that during the last few days he had detected a number of fresh cracks in the stonework.

Sir John Taylor, architect to Her Majesty's Office of Works, said he had nothing whatever to do with the construction of the building, his advice being given only on sketch plans as to accommodation which would be sufficient for certain public

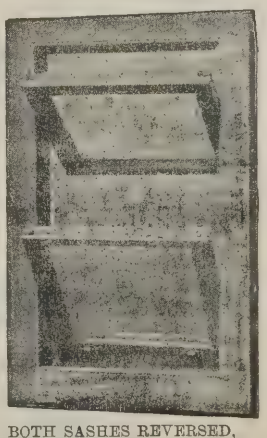
departments. On August 3 last witness made an official inspection of the building, and seeing defects and fractures in the walls, he refused to give a certificate for the Government to take it over. He thought it unsafe for habitation, as unquestionably there was a settlement. Mr. Pollard denied this. He said that there was no trace of subsidence, and the alarming reports in the Press which had been circulated to that effect were entirely devoid of truth. Sir John Taylor said the Government had repudiated the agreement to take over the building. Mr. Pollard said that there was an action pending for specific performance. His contention was that precisely the same circumstances existed as when the Court before decided that there was no power to make an order. Mr. Marsham suggested that the differences between the district surveyor and the defendant's architect should be referred to the immediate arbitration of a well-known professional man.

Counsel complained of the sensational course of the County Council in getting the police to stop all traffic in Victoria Street.

The Magistrate decided to inspect the building with experts, who might agree as to what was immediately required for the public safety.

On Friday last the superintending architect of the County Council, on the further report of Mr. Drury, surveyor, caused a fresh notice to be served on the defendant to take down the alleged defective stonework between the first and second floor windows. Mr. Pollard complained of this action as a breach of faith, and of the fair understanding which was arrived at. At the previous proceedings the district surveyor had tried to get in other matters besides the turret, but his worship confined the reference to the arbitrator (Mr. Clifton) to the matter specified in the summons. If the owner permitted the reference to be enlarged he might be fired at in every direction by the County Council. Sooner than have these constant attacks and changes of front on the part of the Council, Mr. Pawley would ask for the decision of the Court on the legal question, his worship having decided in the previous proceedings that a physical occupation was necessary and that the agreement produced showed that the place was vested in the Crown. Mr. Seager Berry, for the Council, reminded the Court that Mr. Drury had already spoken of the cracks which he noticed after his report on which the summons issued. The County Council were perfectly ready to abide by the reference agreed upon by the Court, but the district surveyor, as a public official, would not take the responsibility for what he considered to be a defective building. It might be excess of caution, but he had served a fresh notice for what he thought was a fresh defect. This was not the subject of a summons at present. Mr. Marsham inquired what were the signs of alteration since the 19th inst. Mr. Drury replied that the cracks had widened. He was of opinion that they had opened since Saturday. Mr. Pollard said it was all very well to make this assertion. In fairness he demanded that the architect for the owner should be sworn and give his version of things. Mr. J. H. Goodland, architect, then tendered himself as a witness, and swore that there was no danger to the public whatever in respect of the building. The only changes which were noticeable were due to the vibration caused by inserting the strengthening steel bands, three of which were now in position. Mr. Berry said he would not cross-examine, as the arbitrator would report. Mr. Marsham adjourned the summons for three weeks, deciding that the arbitrator must report in accordance with the terms of the written agreement signed for the parties in Court.



The solicitor to Mr. Pawley, the owner and architect, and Mr. Rickard, the builder, has stated in the *Times* that his clients are doing, and will do, everything necessary to make the part of the buildings in which cracks have appeared absolutely secure.

FIRE EXTINCTION.

ON Saturday last an immense crowd witnessed a trial of the American combination chemical fire-engine and hose-reel, which for the past few days has been on view at the Police Fire Brigade headquarters, Brighton. Members of brigades from a wide radius had been invited. The test was a very severe one, especially as the apparatus is not so much designed to cope with great and well-established conflagrations, as by rapidity of getting to work, to check and extinguish them at the start. A wooden house some 18 feet in height had been erected on the Level, Brighton, with glass windows and open door, with heaps of shavings piled round the sides, and the frame thickly smeared with tar. So combustible, indeed, were the materials, that when Alderman Lowther, representing the chairman of the watch committee, had given the signal to light up, he and hundreds of people who had crowded near had to run almost for their lives, so sudden and fierce was the outbreak. Fanned by a north-easterly breeze, the flames spread almost instantly over the whole structure, and a sheet of flame rose that would have done credit to the best of the Jubilee beacons. A tele-

phonic message was sent to headquarters, and the engine was quickly horsed and on its way, arriving on the Level within three minutes. At the south end the ordinary hose was paid out and attached to the hydrant, while the engine rushed on to the fire, and Chief Engineer Wheatley, protected by the Vajen-Bader patent smoke helmet, got to work with the chemical jet. The stream of liquid seemed to have instant effect on the blazing mass, and on a portion of the structure the fire was perceptibly deadened. There was, then, however, practically nothing to save, the charred woodwork collapsed like a pack of cards, and the house was as nearly burnt out as possible. The smart way in which the apparatus was used was generally recognised, and it was felt that the test of its capabilities had hardly been a fair one. The structure was altogether of too flimsy a character, and by the time the engine arrived, all the steamers and manuals in the county would hardly have made much difference. So fierce was the heat that Chief Engineer Wheatley, though wearing thick gloves, was somewhat severely scorched about the hands. Fortunately the helmet protected his face and head. To avoid misconception, it may be mentioned that this chemical engine is no novelty. It has been in use for some thirty years, and is now found in the chief cities of America, while Liverpool has recently adopted the system. The engines are in many types, including self-propellers of immense power. From the Level the firemen proceeded to an arch at Duke's Mound, where some interesting experiments were carried out with the Vajen-Bader smoke helmet. Shavings, oil waste, sawdust, tobacco paper, &c., were burnt until the air grew so thick that no one could possibly breathe in the arch without some such apparatus. With this helmet, however, several persons went in, and stopped for minutes, feeling quite comfortable in the reeking and poisonous atmosphere.

A YEAR'S BUILDING IN GLASGOW.

THE Glasgow Lord Dean of Guild has delivered the annual statement on the growth of the city. He said :—Before taking up our ordinary work I propose, as has been the custom, to refer briefly to the character of the work which has passed through the Dean of Guild Court during last year—that is, the year ending August 1. Last September, in performing the same duty, I referred to the year that had then passed as one of exceptional activity, but this year had again outstripped it, 649 linings having been granted at a valuation of 2,106,760*l.*, as against 676 linings valued at 1,851,005*l.* Again, as in previous years, the great bulk of the work had been in one, two and three-room tenements—chiefly two-room tenements—the figures having been 855, 3,367 and 856 respectively, as compared with 811, 2,755 and 972 last year. But there has also been a marked increase in five and six rooms and larger houses, the figures having been 202 and 228, as compared with only 56 and 71, the average of the last ten years. In commenting on warehouses and shops last year I described the year as a record one, but this year has just beaten it with 136 linings valued at 489,080*l.*, against 146 linings of valuation 486,490*l.* One very noticeable feature in comparing the work of recent years has been the gradual increase in the average value of the linings passed. Ten years ago, taking an average of five years ending 1890, the value per lining was 1,850*l.* In the year under review it was 3,240*l.*, as compared with last year 2,740*l.*, and for the last five years 2,400*l.* The increase has been steady and continuous, the tendency having been to build larger ranges of tenements and larger and larger warehouses. Last year, in order to show the progressive movement of Glasgow buildings, I went back for twenty-five years, dividing them, for the purpose of comparison, into quinquennial periods. Adopting the same plan, and commencing with the period 1873-78, the amount of the linings passed was 7,606,776*l.* This was the period of inflation so often referred to in discussing Glasgow progress, and which, as we all know, was followed by one of depression and reaction. In 1879-83 the figures fell to 2,068,673*l.*, the lowest point having been touched in 1881. In the period 1884-88 the improvement continued, the figures reaching 2,255,619*l.*, and in the next period, 1889-93, it was still more marked, the figures rising to 3,982,940*l.* But the last period 1894-98 has been one of leaps and bounds, the total having been no less than 7,990,845*l.*, of which, as before-mentioned, 2,106,760*l.* belongs to this year just passed, the average of the 25 years having been only 955,000*l.* Perhaps, however, a more distinct idea of Glasgow's extension is conveyed to the mind by the length of new streets. The year just passed has been a record one in this matter, nearly six miles of new streets having been sanctioned by this Court. For the 25 years the mileage has been 41½, or an average of only two miles, but this includes the period of depression. Before concluding, I would say a few words on the work of the Court. Last year we had some discussion as to the best means of simplifying and accelerating the increasing work of the

Court. The conclusion arrived at has, I think, proved satisfactory, namely, that plans should be as complete as possible before coming up for final approval. This is the object of the preliminary meeting of the liners on Tuesday for the examination of the plans. There is no reason why the faults then ascertained and pointed out should not be put right on the Wednesday. It seems to me that if a petitioner does not avail himself of the opportunity so afforded, he cannot be very urgent, and so there can be no great hardship in delaying for a fortnight. At any rate it is not fair to the master of works to expect him to go into details here, nor is it fair to the Court nor the agents who are kept waiting, that time should be taken up in discussing them, and therefore I think that plans not in order should be at once put back. I am glad to acknowledge that the agents have generally co-operated in this matter, and I must express my thanks for the assistance given. I must also acknowledge the good work done by the liners, representatives of the merchants and trades' house, whose regular attendance and careful examination of the plans have helped to expedite matters. To Mr. Whyte our thanks are especially due, for on him has fallen the brunt of the increased business, and also to Professor Moody Stuart, who has had to advise us on some difficult points in connection with the provisions of the Buildings Act.

SIR TATTON SYKES AND HIS CHURCHES.

A GREAT many people have never heard of Sledmere, says the *Leeds Mercury*, which it may be necessary therefore to state is a somewhat out-of-the-way straggling village somewhere midway 'twixt Malton and Driffield. But if things go on in this secluded hamlet away up over the chalk lanes yonder as they have been going on for the past month or two popular interest in Sledmere will doubtless be aroused, and the hitherto unsuspected village develop into the battle-ground of a pretty quarrel, the parties to which are Sir Tatton Sykes on the one hand and the vicar of Sledmere on the other. Nominally, the population of Sledmere are on the side of the squire, but apparently for very much the same reasons which actuate the peasantry of Russia in their allegiance to that particular form of government to which they have grown wearily accustomed. Practically the inhabitants are inclined to give their sympathies to the vicar. For the purpose of trying to ascertain the precise causes which have led to so dire a condition of social upheaval in a spot where "only man is vile," a representative of the *Leeds Mercury* visited Sledmere on Saturday. He found it half asleep and obviously overcome by the extraordinary power of the sun. There wasn't a soul about on the dusty roads, save a tramp, who admitted that a request for twopence to buy a "crust of bread" was only another way of asking for a glass of beer. The first indication of anything remarkable was one which could not fail to impress. On the waste grassland adjoining the high road was a stagnant pool. Hard by, and in a state approaching completion, was a handsome monument in white stone, of elegant design and proportions, and richly hewn. The hewing was still in progress, two men being engaged in the pastime. Locally, this beautiful piece of work, which is apparently useless and utterly out of place, is known as "Sykes's Folly." It is, indeed, an example of incomprehensible ideas; and the plain man of to-day, gifted with but an ounce of common sense, would have little hesitation in characterising its erection as a stupendous piece of folly and a sad waste of money. It is understood that the primary reason for the work being undertaken was that the men engaged on the church near by had completed their task, and it was a pity they should not have something else to occupy their talents and attention in so desirable an Arcadian spot as Sledmere. Of course, the natural thing to give them to do, under these unhappy circumstances, was the erection of an exact copy of the Queen Eleanor's Cross at Northampton, which at Northampton is an acquisition of historical interest, but which at Sledmere is a ridiculous attempt at beautifying surroundings which are sufficiently beautiful.

But to come to the question which is agitating all Sledmere to-day. Five years ago all was peace and happiness. But, in a moment of caprice, which some term generosity, Sir Tatton Sykes, whose country seat is in the village itself, took it into his head to demolish the old church, which had stood there for centuries and become endeared, as all such churches do, to the inhabitants as the scene of their forefathers' joys and sorrows, and the natural centre about which Sledmere grew up. The present vicar, the Rev. H. de Romestin, describes the incident himself. He says:—"Sir Tatton Sykes, *motu proprio*, without obtaining the consent of his fellow-parishioners, or a faculty, destroyed, with the exception of the tower, the old church, which was in perfectly good repair, and, I am told, very comfortable and well furnished. This action was absolutely illegal, and all that has been done since has been in the nature of trespass, the ground having been consecrated. Well, what

has been done since? The new church was built, and plenty of time taken over it. For five years the parishioners were without a church, but at length the new building was consecrated. It was a very beautiful church. The work executed was of the best procurable; the carving of the oak pews, the screens, the reredos and the organ case was marvellously beautiful and complicated; all that money could do, apparently, was done. Sir Tatton took a great interest in his gift, and journeyed to Peterborough to see the magnificent chancel screen, with its five figures and cross surmounting. He was, it would seem, well pleased with it, and it was therefore erected in the church. It had not been there long, ere, early one miserably misty morning, Sir Tatton went down to the church and ordered its practical destruction. The magnificent cross and the figures were taken away, and a great part of the arch itself removed. All this, to the waste of thousands of pounds, and to the consternation of the architect. It would have been in my power to intervene, but as the work had been begun before my arrival, I kept to my resolution of not interfering."

There were six old Italian candlesticks in the old church, and everybody who knows anything at all about Church matters knows that these ought to be in the church to-day. But they are not. Sanction has never been given for their removal, but Sir Tatton Sykes has been understood to say that "the Archbishop might take proceedings against him if he liked, and that having, as he thought, established his right by making what alterations he pleased in various churches for many years past, he was not going to break the tradition." After this, it is easy to understand that sanction or sacrilege is a mere detail to Sir Tatton Sykes. He built the church, and the church is therefore his, it would appear. He declares that things shall be in it as he wishes them to be; and certainly, so far, he has successfully pursued his policy, and given full play to his caprices. The candlesticks are gone, nobody knows where. Sir Tatton has presented two standard candlesticks in brass, which stand near the altar, but he absolutely declines to allow any candles to be placed in them. One marvels why, there being an organ, he allows one note to be pressed, one blow of the bellows to be forced. There is no knowing, of course, what the future may do to modify his views as to the propriety of a church organ producing sound, and in the meantime one may well conjecture what the worthy baronet's decision will be in regard to the chains suspended from the roof of the church, and which dangle down with an air of dejected indifference as if they wondered why on earth they had ever been placed there. It is quite obvious that these chains were originally intended for the suspension of lamps, but up to the moment of writing there have been no indications of any lamps being forthcoming. There were some old lamps, of course, in the demolished church, but, as with the candlesticks, their exact whereabouts remains a matter clouded in the densest mystery. So, indeed, does the church itself after dusk, for, in consequence of the fact that scientists have as yet proved unequal to the solution of the problem as to how to produce light from a mere chain, Sledmere Church at eventide is wrapped in darkness. The parishioners have therefore regretfully to forego their evening service, and this is one of the many sore points that the existing state of things has produced. There are two side altars in the church, and these were stripped some little while since, by order, it is said, of Sir Tatton, on the ground that the slabs were such admirable specimens of fossils. There are no churchwardens at Sledmere. The vicar stands single-handed, resolved to fight every inch of the ground.

Interviewed on Saturday, the Rev. H. de Romestin stated that until quite recently Sir Tatton Sykes and he were on the most friendly terms. He had discussed with the baronet the latter's wishes in regard to the church, and assured him that he would use his influence with the Archbishop in regard to them. Sir Tatton, however, chose to discontinue his friendly relationship with the vicar, through no fault, it would seem, of Mr. de Romestin. The usual supplies of fruit and vegetables to the vicarage from Sir Tatton's gardens suddenly stopped one day, as did the water-supply itself for a time. Mr. de Romestin assured our representative that the state of things existing between himself and Sir Tatton Sykes was not in any way due to personal animosity in any shape or form. "I can only attribute it," said Mr. de Romestin, "to his extraordinary eccentricity and self-will. He is a man with whom it is useless and impossible to argue." The vicar added that he had laid the case before the Archbishop, who, however, had arranged nothing so far, as he was away from home. Mr. de Romestin was hoping to see his Grace during the coming week, and something might definitely be resolved upon. The vicar was of the opinion that only an injunction would restrain Sir Tatton Sykes's interference with the rights of the proper custodian of Sledmere Church, but whether the application would be made by the Archbishop or by himself (the vicar) was a question upon which nothing had as yet been decided. Sir Tatton, it further appeared, has had duplicate keys fitted to the church, and insists on the edifice being kept open day and night. True,

there is nothing much left for the sacrilegious thief who might chance to wander Sledmerewards to lay his hands upon, but, on the other hand, the church is not a branch of Dr. Barnardo's philanthropic institutions. Sir Tatton Sykes, according to the impression created in his own parish, would appear to be profoundly convinced that the expenditure of his own money upon the church, and the fact that it stands in his own park, gives him the right to do just exactly what he pleases with the building, without regard to either law or any person's feelings. Whereas, as a matter of fact, it does nothing of the kind.

Questioned as to why there were no churchwardens at Sledmere, Mr. de Romestin explained that nobody cared to serve, for obvious reasons. There has been no churchwarden in the village for years, and the people have grown rather conservative as regards innovations of this sort. Or so it would appear. Our representative further gathered that in the times of the old church the service was of the extreme ritualistic order—almost Romish, in fact—whereas to-day it is the reverse. In reply to a question, Mr. de Romestin explained that that could not be accounted responsible for Sir Tatton's attitude, as Sir Tatton was, as every one in the parish knew, a good Protestant. There was, said the vicar, absolutely no reason, as far as he was able to ascertain, for Sir Tatton Sykes's conduct in regard to the church.

A visit to the church itself bears out Mr. de Romestin's statement that it is "almost entirely bare, and has an unfinished and desolate appearance, very painful to those who come to visit it." There is nothing inside to rob the church, beautiful as it is, of its cold and comfortless aspect; whilst outside an unnecessary builder's yard and sheds almost touch the church, and are naturally wholly out of harmony with the surroundings. Inside, the pews provided are wholly insufficient for the requirements of the parish, and barely fill the nave. Hence the vicar has had to resort to chairs, and these Sir Tatton objects to. Indeed, he has already had some of them removed. Outside there is a boundaryless churchyard, the boundaries having been removed some while since. "I am doing no more," wrote Mr. de Romestin quite recently, "than (very unwillingly) resisting a pretension to treat a parish church as private property. I am defending the rights of the parishioners of the Church at large and of incumbents generally. So soon as Sir Tatton Sykes recognises that other people have rights all difficulties will end." Visitors to Sledmere make remarks about the church and its history, and Mr. de Romestin writes :—"I wish that their remarks were more audible."

ELECTRIC MOTORS AND SMALL INDUSTRIAL PURPOSES.*

THE electric motor is rapidly becoming the most favoured medium for the transformation and transmission of energy for all industrial operations whether on a large or a small scale. This is due to the paramount advantages it possesses over any other method of utilising potential energy. These advantages are well known to electrical engineers, but indifferently appreciated by a large number of mechanical engineers, and almost unknown by the general manufacturer and tradesman. To the last of these three, the general manufacturer and tradesman who is using machinery driven at present by steam or water-power, the electric motor must in the days to come prove of exceptional value, and yet, strangely enough, very little effort has hitherto been made either by the motor-maker or by the managers of electricity supply undertakings to open up this very wide and lucrative field of enterprise. There is no necessity to enumerate here the many excellent and distinctive features which the electric motor possesses. The intention in this paper is rather to consider the reasons why its application up to the present time has been confined to a few special trades and manufactures. We are familiar, for instance, with electrically driven pumps, electric hoists and cranes, electrically driven machine tools, and electric power transmission in works—cases in which the generation, transformation and application occur practically under one roof. Many manufacturers and constructional engineers, wisely and readily incurring additional capital outlay with the object of securing more economical production, have adopted electric motors, which do not entail the use of endless and power-absorbing shafting and countershafting. As yet, however, it cannot be said that the electric motor is in general use, or scarcely other than just past the threshold of its future domain.

The smaller producer and tradesman, to whom motive power in some form or other is essential, and who feels more acutely than his larger confrère the effects of competition, has, in the great majority of cases, still to put up with very much more cumbersome and very much less efficient means of power production. Almost every town with any pretensions to size and importance has its own large staple industries as well as many

* Abstract of paper read before the Section of Mechanical Science at the meeting of the British Association at Bristol, by Alfred H. Gibbings, M.I.E.E.

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

minor industries and businesses, requiring the use of other power than hand-power. There are also some handicrafts which are at present unavoidably confined to hand-power, because steam, gas, oil and hydraulic power are each and all inapplicable. There can be little doubt that the electric motor would be welcomed and readily adopted in these cases if only its simplicity and adaptability were known and understood.

The chief obstacle to the more rapid adoption of electric-motive power, especially in the case of small tradesmen, throughout the country is undoubtedly the want of capital to purchase the necessary motor; but where the power to purchase exists, the buyer will probably have little or no experience or knowledge of electrical matters to guide him in his purchase; if his means are at all limited he will be tempted to venture on a cheap line, and become the dupe of those who simply make to sell. The solution of these difficulties is that the owners of electricity supply undertakings, whether a public company, municipality or other local authority, should themselves purchase good, reliable motors, and let them out on hire. Antecedently this scheme may appear a sort of parental régime, but it is suited to present circumstances at any rate, and experience proves it to work well. Unfortunately, all local authorities have not got powers to borrow money for this purpose, although it appears from the Electric Lighting and Public Health Acts that borrowing powers may be granted by the Local Government Board for works of a permanent nature. Electric motors do not yet come within that category, although gas-stoves do, a legal decision having been given in their case. All future municipal Parliamentary bills should therefore contain clauses which would confer such powers and secure freedom of action in this respect. In Bradford a rental charge of 10 per cent. upon the initial cost of each motor has been found to be amply sufficient. This is made up of 3 per cent. for interest, 3 per cent. for sinking fund and 4 per cent. for depreciation and contingent expenses. The Bradford Corporation inaugurated their scheme of hiring (in which also arc lamps are included on similar terms) in November, 1896, and it was found that the increase in electricity supplied for motive power in 1896, in which year the hire system had been in operation for two months only, was 19,053 units; in 1897 the increased sale over 1896 was 52,204 units; and in the present year the increase is likely to be 62,834—or a sale of 180,000 units, or 53 per cent. over 1897.

Hitherto the supply has been confined to small power uses—such as cranes, hoists, fans, pumping, aerated water making, electric advertisement signs and similar purposes. During the last month, however, so popular has the electric motor become that applications have been received from a large spinning and weaving firm, two foundries for blower purposes, an engineering shop requiring 50 horse-power and a saw mill requiring about 20 horse-power. I referred a moment or two ago to the want of confidence of the small power user in the electric motor; that confidence, however, is soon gained. It is gratifying to be able to state that several consumers in Bradford who originally applied on the hire system, and at the time with much trepidation and many inquiries, have since decided to purchase the motors outright.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

19345. Frederick Warren, for "Improvements in or relating to chimney cowls and the like."

19457. Alfred John Loftus, for "An improved cement for securing wall-facing tiles and for like purposes."

19465. Valdemar Kjeldsen, for "A furnace or kiln for calcining cement materials."

19523. Reinhold Brunk, for "Process for manufacturing bricks, tiles, &c., from the refuse of alkali works."

19577. Jos. Guthlein, for "Improvements in scaffolding."

19592. Hermann Appel, for "Improvement in soot-traps for chimney flues."

19633. Gustave Collantier, for "An improved coating material for decorating and building purposes."

19749. Robert Thomson, for "Improvements in columns and beams for structural purposes."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

ELECTRIC LIGHT WIRING.

THE
NATIONAL SYSTEM
IS THE
Safest, Cheapest & Most Durable.

NO WOOD CASING OR OTHER PERISHABLE MATERIALS USED.

The System possesses all the advantages of Concentric, Iron Barrel, or Conduit, at half the price, without their disadvantages.

Installed at the
LIVERPOOL NEW HEAD POST OFFICE,
DERBY TECHNICAL COLLEGE,
WEST HAM TECHNICAL INSTITUTE,
WALLASEY PUBLIC BUILDINGS and FERRIES,
METROPOLITAN FIRE BRIGADE HEADQUARTERS,
Numerous Churches, Hospitals, and Mansions.

INSTALLATION WORK CARRIED OUT FOR THE TRADE.

ESTIMATES AND PARTICULARS FROM
THE NATIONAL ELECTRIC FREE WIRING CO., LTD.,
FARADAY HOUSE, CHARING CROSS ROAD, W.C.

Clarendon Road, South Shore, Blackpool.
45 Copenhagen Street, Worcester.

FRANCIS HOOPER, Architect.

The Architect.

THE WEEK.

On Wednesday the Duke of Westminster laid the foundation-stone and in that way inaugurated the restoration on a large scale of the parish church of Macclesfield. The old church was founded by the Queen of Edward I. in the year 1278, when Macclesfield was within the diocese of Lichfield and Coventry. There have, of course, been alterations and restorations since that time, but the consecration mark—a cross cut in stone—may still be seen near the entrance to the Legh chapel, where part of the original south porch is preserved. The church has seen troublous times. During the Reformation "it was despoiled of its costly ornaments, and the splendid gold and silver plate and other valuables with which it was enriched were given over to Henry VIII." Then, again, when Macclesfield was besieged by the Parliamentarians during the Civil War, the spire of the church was battered by the cannon of the besiegers under the command of Sir William Brereton. The oldest portions of the church are the tower and the Legh and Savage chapels, so named after two ancient Macclesfield families. The tower (the cost of the restoration of which is being borne by Mr. J. Kershaw, of Macclesfield), will retain its characteristic features and will simply be refaced with new stone. The two chapels alluded to are both eventually to be restored, the former to be furnished as a baptistery, and the latter to be formed into a morning chapel. The remainder of the church is to be practically rebuilt, the cost of the work, which is to be carried out under the direction of Sir Arthur Blomfield, A.R.A., being estimated at something like 17,000*l.*

The first stage in the competition for the proposed Californian or Phœbe Hearst University is now passed. Out of the hundred plans submitted in competition, eleven were selected this week by the judges at Antwerp, and the authors will take part in a second struggle. In addition a sum of 1,200 dols. will be paid to each of them. New York has the lion's share of the success, for its representatives are Mr. J. H. Friedlander, Messrs. Howard & Cauldwell, Messrs. Howells, Stokes & Hornbostel, Messrs. Lord, Hewlett & Hull, and Mr. Whitney Warren, architects. Messrs. Despradelles & Codman hail from Boston. Three of the five successful European competitors belong to Paris, viz. MM. Barbaud & Banhain, M. E. Besnard and MM. Heraud & Eichmuller. M. Blunschli belongs to Zurich and M. Rudolf Dick to Vienna. The judges were M. J. L. Pascal, president, Dr. Paul Wallot, Mr. R. Norman Shaw, R.A., Mr. Walter Cook and Mr. J. B. Reinstein. It is expected some additional designs will be acquired. The adjudication in the second competition will be undertaken next June.

Henceforth architects in Quebec will have to be registered, as by an Act for the purpose the former conditions ceased to be legal in September. Upwards of 100 applications it is understood have been received from persons desiring to be registered and thereby be authorised to use the title "Architect." The Council of the Province of Quebec Association of Architects have been busily engaged of late with these and other matters relating to the operation of the new law. The annual meeting will be held towards the close of this month, when the Council will be able to explain the prospects of the profession under the new conditions.

The people of Southsea must expect to see the common presenting a less open appearance before long. Although it is supposed to be public, or rather borough, property, it belongs to the War Office. The Portsmouth Corporation, as the representatives of the town, have a sort of tenancy of the common, but subject to eviction whenever the exigencies of defence become pressing. An indication of what may have to be done hereafter on a more extensive scale was given this week. On Monday the roads and works committee of the Corporation received a notice from the military authorities announcing their intention to erect a building on the common. It was understood that an engine-house was contemplated, which rarely is a kind of building that would improve the appearance of a common. Something is to be done to mask the engine-house by means of mounds, and the planting of trees will probably be allowed. But Portsmouth holds too important a position as an aid to national defence to admit of a sacrifice of security to picturesqueness. The War Office should, however, endeavour to avoid making their engine-house an unsightly object.

The groynes which were lately constructed at Worthing appear to have done their work effectually. The watering-place was plagued with accumulations of weed which were not only costly to remove but were offensive to the majority of visitors. The shore is so flat, the tides were powerless against the nuisance. It was decided to construct long timber groynes rather light in character, but just sufficiently strong to withstand the waves. After seven months' experience of Mr. Case's system it is found there is a great diminution of the quantity of seaweed. What is done can only be considered as experimental. Mr. Case accordingly advises that the groynes should be extended at least another 400 feet, making them not less than 600 feet each. A depth of 5 feet of sand will then, in course of time, accumulate, burying the existing work. The groynes if carried well seaward can be spaced further apart. The sand would in course of time form a gentle slope which would make it more easy for seaweed to be carried by receding tides. The system proposed is economical, and it is said the long groynes do not cause any inconvenience to boats on such a coast.

From his position as a teacher in the Architectural Association Mr. F. R. Farrow is acquainted with the capabilities as well as with the needs of students of architecture. His "Specifications for Building Works" (D. Fourdrinier) is not like Donaldson's and other big volumes, made up of copies of specifications for particular works, but a succinct description of the items which should never be overlooked in the preparation of such documents. It does not aim at supplying model forms, which can be applied by a copying clerk's aid to particular works; it more resembles a collection of formulæ containing the pith of the subject, although occupying no more than a limited space. The beginner should not be content with using it as a directory for occasional reference; he should read the manual repeatedly until he is familiar with the contents. Then using it as a basis he can modify it according to the circumstances of practice. Mr. Farrow has obtained the aid of some specialists. This suggests that he does not profess to be omniscient, and in several places he reminds students to avoid all assumption of that quality. For instance, he says:—"Although the student might specify a certain wood as, say, Riga wainscot, he can hardly be expected to be able to determine by inspection alone whether what he specifies is being supplied." Again, it is said of ironmongery:—"It is of little use to specify the best quality or to attempt to define the quality, as this varies, by almost imperceptible gradations, from a very high standard to a very low one." Advice of this kind is not the least valuable part of the book, for it may induce the student to avoid the poising which is too common among practitioners. For many reasons the manual is, therefore, worthy of recommendation, and every architect who takes pupils should insist that they obtain copies.

The number of visitors to Chantilly, the Duc d'Aumale's gift to France, on the Thursdays and Sundays when it was open free during the past few months was 80,000. That was a large number for a first season. It is also supposed that the whole of the collections would not be visible. Next year an increased number may be anticipated. Many of the visitors were foreigners. There was also of late an increased number of visitors on those days when payment for admission was required. The château will be closed during the winter, but the beautiful park can be used by pedestrians on Thursdays and Sundays.

UNREST IN ARCHITECTURE.

A PERPETUAL subject for discussion at Church Congresses is found in the shortcomings of the age. Every year there is a revelation of human weaknesses, but a century hence we suppose speakers and listeners will find the varieties are not exhausted. This year our deficiencies, whether as clergy or as laymen, were ascribed to restlessness. According to Canon Bonney, "We had become more impulsive, emotional, at times almost hysterical; we swung from extreme to extreme; we were losing that sense of proportion, that sobriety of judgment and fixity of purpose which once distinguished us. Personal whims took the place of great principles, and the faddist and the fanatic were far more than ever before a power in the land. In a word, the Celtic element in our character was more dominant than it was half a century ago. We despised the path of inconspicuous duty, and extolled those who played to the gallery; we were impatient of any continuous thought or process of reasoning, and our mental stomach had now become so weak that its food must be minced up into paragraphs and seasoned with stimulating head-lines. Unrest, then, was to a large extent a disease of the nerves, fostered by the conditions under which many of us were compelled to pass our lives. It was a neurotic condition, which, though it could not be entirely cured, could be alleviated and improved if we had the courage to recognise facts, and to set ourselves to make the best of them."

But if we are restless we cannot claim to have introduced the weakness. There is nothing new under the sun, not even the neurotic condition. It is a phenomenon which has appeared from time to time, and as we look back it appears more like a harbinger of a better state of things than a disease. The Rev. Professor Gwatkin said that "One saw it in the age of Isaiah, when the Assyrian was breaking up the primæval kingdoms of Asia; and again in the times of Pericles, when the old beliefs of Athens were unsettled. One saw it on a great scale in our Lord's time, when the ancient world of nations was melting down into the Roman Empire; and not less clearly 400 years later, when the empire itself was dissolving into a new world of nations. The sixteenth century was profoundly stirred by the restoration of learning, the discovery of America, and the reformation of religion; and that again was an age of unrest. There was deep unrest in every age of change."

We suppose many people who heard the papers read at Bradford accepted them as if they resembled those read a week or two before at Bristol, and were descriptive of genuine discoveries. The reverend authors would not, we are sure, make any claim for originality. Anyone who attentively studied the buildings erected in England of late years would be enabled from them alone to conclude that the age was one of unrest. Architecture, like the drama, holds the mirror up to nature. It is impossible to force a particular style or manner of treatment into popularity unless the public are prepared for its reception. If Walter Scott had not acted as a pioneer we might still be placidly building churches and houses of an unromantic type, and be content with the belief that interminable rows of unvarying dulness were the necessary developments of Greek and Roman buildings under the influence of the mysterious law of evolution. A number of causes combined to bring the eighteenth century into favour, and what was more natural than to take up the style which was then the vogue in England? Modern Gothic could express restlessness to a marvellous extent, and was undoubtedly largely employed for that purpose, but as an exponent of a neurotic condition it could not approach the productions of Holland and Flanders. Therefore we patronise imitations, more or less exaggerated, of the buildings which once sheltered English exiles, and the Spielhäusen in which Matthew Prior and his companions were accustomed to pass the Sundays. Romance revived Gothic and "Queen Anne," and we must assume it will have its influence on whatever style is awaiting the Hour and the Man.

It will, however, be difficult to discover or devise a style which will be so well adapted to meet the needs of a restless age as the one which is now in its glory with us. Classic and Italian have been so often systematised, it is no wonder they are disliked by many because they are supposed to be capable of an almost mechanical reproduction by any one who is content to follow certain rules and proportions. On the other hand, there are critics who believe that fidelity to precedents is a sure means to attain perfection. "If Vanbrugh had borrowed from Vitruvius as happily as from Daucour," said Horace Walpole, "then Inigo Jones would not be the first architect of Britain." But although they may not be respected like doctrinal truths, the existence of canons of art is some check on license. On that account if more attention were given to Italian examples the Free Classic of Britain would possess less of that independence which is supposed to have made it picturesque, and brought it into relationship with Gothic. But as the Dutchmen cared more for the exercise of liberty than for systematising it, their architecture can be transformed without the risk of an allegation of offence against any written or printed law to be found in the archives of their academies.

It must be owned that we have shown more courage than was seen in Holland when treating forms that once were Italian. The buildings in that country appear sober to the modern spirit of restlessness. That cannot be said of the newest English efforts at adaptation. In the latter we seem to see the designer's intentions varying from minute to minute. His lines appear to be made up of the revolution of a point that he cannot without difficulty guide in one direction. If by custom a line or a plane is expected to indicate the shortest distance between the beginning and the termination, we are sure to find a roundabout course is adopted. Curved lines are substituted for those which commonly were straight and *vice versâ*. The unexpected is sure to be turning up a great many times in a modern building. The novelties are not always graceful or logical, but at least they save us from monotony. The process of varying which is supposed to have succeeded with the importations from Holland is being applied with no less zeal to old-fashioned English buildings. The builders who lived a couple of centuries ago did not know of the word "picturesque," and they made no frenzied attempts to display the qualities for which the word stands. They did not break up a roof into a great many smaller roofs for the sake of producing an effect on some of the passers-by. The expense of repairs was to them an obstacle to freakishness in dealing with the upper part of a building. There was no fear among old-fashioned builders of a wall on one plane. If projecting storeys were needed they took care to make the means plain by which they were combined with the lower storeys. The tendency is now growing to suggest that the various parts have each a sort of independence. This peculiarity is attained by the avoidance of the same colours. The tiles not only will differ in redness from the bricks, but the bricks on one part vary from those elsewhere in the building, as if a resemblance to patchwork were sought after. But the more marked the diversity the greater is the satisfaction which is felt by the public.

The wise men at Bradford who discoursed upon restlessness were unable to announce any specific for the malady. Even the so-called "quiet days" were declared by the Bishop of Manchester to bring no cure. His lordship went so far as to recommend absolute solitude among the moors and uncultivated regions as worth a trial, in the hope that a retreat there might have the same effect as a periodical refuge in the desert produced on the ancient Fathers. Who can say whether on return to the conditions of ordinary life the restless spirit would not be found to assert itself with more strength?

While men are disposed by their nature, for the time eing at least, to demand continuous novelties, it would be a dangerous undertaking for architects to try the experiment of converting them into an admiration for that repose which should always be a marked quality of a building. To many it seems incomprehensible that clients and others could have enjoyed the quietness which at one time prevailed in London. Certainly the monotony of long, unlovely streets like those of Pimlico is enough to compel people to adopt variety at any cost. But extremes of all kinds are detestable. It is possible to have quaintness, novelty, picturesqueness and what not without producing fantastic combinations that suggest an overthrow of the mind's balance. The taste of the public is now, however, in a state that only enjoys discordant melodies, and as such weaknesses grow it is difficult to say what is to come next.

It is certain, however, that the Church Congress, with the best intentions, cannot show how that quietude is to be attained which should display itself in buildings as well as in minor works. All that can be done apparently is to wait in hope for the reaction which is inevitable.

THE CRADLE OF A GREAT COLLEGE.

By John A. Randolph.

TWO miles from Rethel, which is an hour's rail from Rheims, lies the village of Sorbon, most picturesquely situated. The road goes through Rethel straight from the station, and as an intentional clue to strangers in quest of the village is, near the outskirts, called Rue Robert Sorbon. The road is bare, glaring and uphill for awhile, with a fine expanse of tolerably wooded spire and hamlet-dotted country to the left. At the top of the hill a pleasant change occurs, the road becoming a trifle shadier and downhill, bearing slightly to the left, and a fertile valley on both sides of the road. From the summit of the hill Sorbon can be seen nestling among the trees on the slopes in the offing, but the road from Rethel does not go direct to Sorbon. At a few yards from the bottom of the hill there are some good trees clustered together alongside the brooklet, close to where the bare road to Sorbon—an uphill walk thence of just over a mile—branches off to the right. Reaching the summit of this last uninteresting mile of shadeless road an exquisite landscape rewards the tired pedestrian.

Only a few steps away—barely 50 yards—the village lies practically hidden from the winding road by a miniature wood of noble trees, which shelter a small valley watered by the same stream mentioned above. Between the trees peeps of timber-framed dwellings, which would, in this country, be classed as unfit for human habitation, so picturesque and tumble-down are they, can be obtained. Two or three minutes walk, and the road to the church branches to the right, emerging from the wood on to a bit of rising ground.

Here is the church, with picturesque churchyard, guarded at the western entrance by a couple of magnificent elms rising at but few feet from the fourteenth-century west front of the sacred edifice, which is in good preservation. The window and the west door are the only traces, however, of Gothic in the church, though the quaint little spire, with its four-corner spirelets, is more Gothic in appearance than inspection of detail would seem to convey the impression of, as the spire lights are round-headed and the whole is slated. The north porch is the original wooden one, simple and picturesque, and very early in date. The church has Renaissance fittings, with mahogany wainscot in the choir. The south transept contains the font at which the pious founder of the Sorbonne was baptized in October 1201. On the south side of the nave—there are no aisles—a commemorative monument to Robert de Sorbon was inaugurated with great ceremony in 1888. It represents, above the inscriptioned pedestal, the features of Robert, now a bronzed bust in plaster, but later on to be a real bronze one, under a canopy surmounted by a miniature reproduction of the Sorbonne dome. The picture over the high altar is the Transfiguration, but the light is unfavourable for proper inspection. In the diminutive steeple are three bells, with inscriptions. Their tone is pleasing, though they are of comparatively modern date. The ceiling of the church hides the original "open" roof, which is elaborately beamed, considering the small size of the edifice. The windows have very tolerable stained-glass and are all round-headed, excepting the west one which, as we have already stated, is Gothic. There is no east window, the choir having been restored in recent years in the Renaissance style, with a three-sided apse, the eastern side of which is "blind." A much-worn inscription of early in this century is to be found outside the choir on the south side, but to whom or to what it refers it is impossible to say.

Leaving the church and going west the branch road is again reached, and bearing to the right, the house and farm of the late mayor are conspicuous. A few steps further bring us to a tumble-down courtyard between two houses, which is pointed out as the site of Robert de Sorbon's birthplace.

The village of sixty-two "fires" and 340 souls is built over a vast network of vaulted passages of Roman times, where the inhabitants took refuge during the wars. We say "wars," for there were no less than three before the great Franco-German struggle—the Civil war, that of Turenne and that of the Fronde, at which the whole village was practically destroyed and the inhabitants ruined. Even the church was badly damaged then, but left standing.

New houses are now erected and inhabited, facing and west of the church, where the interesting site alluded to is located. The road leads to the village on the other side of the hill, where Gerson, another Sorbonist of renown, was born; and Arnicourt, which was the château of the lords of the domain in which the village of Sorbon was situated, is not far off.

Rethel, the post town of Sorbon, has a fine "twin church" with grand porch, standing on the top of a hill near the extremity of the town, and, to our surprise, the electric light is used in even some of the tiny shops at the end of the town Sorbonwards, and here and there about the better part of the town. This incongruous commodity is supplied from the machinery of a manufactory in the outskirts, and ceases at nine or ten o'clock at night.

WINDOWLESS BUILDINGS.

IT is stated in the *Canadian Architect* that Mr. Howard Constable, who a few years ago was a successful competitor for the position of supervising architect of the United States, is the author of a scheme for the erection of windowless tall buildings on expensive sites. It is proposed to furnish such buildings with entirely artificial light instead of a combination of natural with artificial light, as at present. Ventilation would be provided by a system whereby fresh air would be brought in from the roof in pipes and conducted in proper quantities to the various rooms thoughout the building, while the impure air would also be expelled through pipes, which might be charged with chemicals so as to destroy disease germs with which it might be impregnated. The advantages claimed for this style of building are that the space now required in such buildings for a central court for lighting purposes would be available for use and would add considerably to the revenue; that the absence of window openings in the outer walls would greatly lessen the fire hazard; that all rooms in such a building would be equally desirable; that smoke and foul air which now enter through windows would be excluded, and that if the architect were relieved from the necessity of figuring out the problem of how to successfully light so many scores of rooms, he could make his façade much more beautiful. The author of this ingenious if somewhat impractical theory of construction admits that the public is not likely to immediately fall in with his ideas, but proposes that his theory should at once be put in practice by reducing the number and size of window openings in buildings of this class to be erected in the future, and by glazing them with wire mesh glass, which would resist the action of fire.

FIREPROOF MATERIALS.

THE much-felt requirement for thoroughly independent tests with fire-resisting materials and systems is to be met by a testing station organised under the auspices of the British fire-prevention committee, where in lieu of the generally very one-sided exhibitions given by makers and inventors, the investigations will be carried out reliably in an essentially practical manner and on scientific lines.

The committee's testing station will be near Regent's Park, within easy reach of the West End, and the necessary arrangements are already being made to inaugurate the first series of tests. Systematic research work in the question of fire-resistance has as yet only been commenced in the States, and the testing station in question will be the first of its kind in Europe. The preliminary arrangements have been in the hands of Mr. Edwin O. Sachs, acting for the executive, and Mr. Frederick R. Farrow, acting for the commercial section.

The tests in each case will be undertaken by the executive, in conjunction with representatives of the Council and the general body of members, and the reports will take the form of statements of facts, supplemented by diagrams and photographs, duly attested.

The first test will be with ceilings, and the first makers to have ceilings tested will be the Asbestos and Asbestic Company and the Expanded Metal Company.

SOUTHWELL CATHEDRAL.

THERE could hardly be a more marked contrast between varieties of architectural ornament than is presented in the south-transept door and the chapter-house door of Southwell Cathedral. The entrance to the south transept is so liberally endowed with the zigzag or chevron that the moulding becomes a constructive rather than a decorative feature. It assumes the character of arching and jambs as well as of a continuous string-course. The door, instead of offering a welcome to strangers, appears as if intended to deter them from entering. The composition might have been inspired by the devouring mouth of one of the mythical sea-monsters which are so often introduced in he northern sagas. Looking at this doorway and at those of Iffley and Clymping, we can understand why the old Icelandic code obliged shipmasters when nearing the island to remove the figure-heads from their vessels, in order that the good genii and fairies should not be scared by the gaping jaws of the carven monsters. The doorways in churches of a later period, which compelled people to bend low before entering, could hardly be more symbolic of the necessity of a humble spirit than the grim portal of Southwell. The man who designed it must have had a gloomy mind, and we suppose he rarely entered a church with joy. If we remember that the transepts were erected between 1110 and 1114, there would be many things occurring at that period which would make men serious.

There was a different spirit prevailing when the chapter-

South Transept Door, Southwell Cathedral.

house was erected at the close of the thirteenth century. Men were able to rejoice in the beauty of nature. The sculptors who carved the exquisite plants were not imitating workshop patterns. They had evidently recourse to natural forms, and the spirit of the work reveals that leaves and berries were studied by them with an affectionate appreciation of the beauty of vegetation and admiration of the living force they express. In some places the subjects are arranged to correspond with accepted laws of decoration; but it is manifest the sculptors were happiest when they escaped trammels and suggested the liberty which their models enjoyed. In all cases they took care to avoid an arrangement of the forms which might suggest that leaves or stalks or the birds which appeared among them were of any constructional use. It cannot be said that any weight comes on the vegetation, for the mouldings and other parts of the masonry which do the work are only partially concealed by the ornament.

Carving on Chapter-House Door, Southwell Cathedral.

The difference between Southwell Cathedral as it now appears, and its former condition before the restoration was undertaken, will be suggested by the following correspondence between the Society for the Protection of Ancient Buildings and the Ecclesiastical Commissioners. It supplements the letters already published:—

The Society for the Protection of Ancient Buildings,
26 Queen Square, Bloomsbury: April 17, 1878.

To the Ecclesiastical Commissioners for England and Wales.

My Lords and Gentlemen,—On behalf of the Society for the Protection of Ancient Buildings, a Society whose objects are explained by the circular enclosed herewith, I beg most respectfully to address you with regard to the works proposed to be done to the Collegiate Church of Southwell Minster.

The Society recognises with satisfaction that since the building has been under the control of the Commissioners the security of the fabric has been considered and its condition as regards stability improved, but at the same time many alterations have been made which in the view of the Society have been destructive of its artistic and historical character.

The removal of the modern fittings of the choir, which were in themselves of no great value, but inasmuch as the removal also involved the destruction of the very interesting side screens, was a step which the Society greatly regrets should have been taken, and the rearrangement of the pewing of the choir appears to them to have been an entirely unnecessary alteration, as though the design of the pewing was modern and poor in quality, it was quite adequate to the requirements of cathedral service.

It is understood that the Commissioners have sanctioned a scheme for removing the present low-pitched roofs and the flat ceilings and substituting high-pitched roofs, open internally, throughout the church.

Against this proposal the Society desires to enter its energetic protest, and respectfully asks the Commissioners to reconsider their decision for the following reasons, which the Society trust that the Commissioners, as guardians of one of the most important public monuments in the kingdom, will not consider unworthy of their consideration.

The proposed alteration, if carried out, will necessarily involve the destruction of the present wooden ceilings of the nave and transepts. These ceilings were laid shortly after the fire of 1711, and are in all probability rude but still not unsatisfactory copies of those which were destroyed by the fire. They have an excellent effect, are broad and simple in design, and are much more in accordance with the architecture of the church than an open roof.

The ceilings are of oak and are apparently perfectly sound, no flaw being perceptible from the floor of the church. The outer roofs do, it is true, admit water in places after heavy rains or continued snow, but as they are covered with slate this is no more than what would occur in the roof of any other building of a similar size.

The Norman nave was in all probability covered originally

with a flat roof similar to Gloucester and St. Albans. This was replaced in the Middle Ages by a pitched roof; but we have no evidence to show that the alteration was an improvement, but, on the contrary, the subsequent removal of this roof and the substitution of a flat roof tends to show that its effect was not found satisfactory.

Although the present roof dates backs no further than the beginning of the last century, it is indisputable that the lowering of the roofs took place at least a century earlier, as Hollar's engraving of the cathedral (which was made in 1672) seems to show them in their present condition.

All trace has been lost of the design of the Mediæval roofs, so that any restoration must be entirely conjectural, and therefore unsatisfactory, when regarded from an antiquarian and architectural point of view.

A matter of even greater importance arising out of the contemplated raising of the roofs is the obliteration of the wooden lantern between the western towers, which would be swept away if any other roof is substituted for the present.

In all probability the destruction of this lantern was not present in the mind of the Commissioners when the question of the alteration of the roofs was under consideration, and the Society earnestly hopes that now that the entire effect of the proposed raising is brought to their notice that the Commissioners will hesitate before they give their sanction to a proposal which will inflict an irreparable injury upon the church, and deprive it of one of its most interesting and characteristic features.

The lantern is perhaps unique of its kind, and though exceedingly simple in design, it is so dignified in expression and adds so much to the charm of the church that its removal would be a source of the deepest regret to all who are truly interested in what is most native in one of our first and best preserved national monuments.

The Society trusts that the Commissioners will, for these reasons, refrain from carrying out an alteration which is perfectly unnecessary and uncalled for, which will in no sense add to the safety or beauty of the church, and that they will devote the funds at their disposal to the preservation in its present state of the interesting building committed to their charge.

It would be a lasting disgrace to the century if it should happen that through injudicious interference the Collegiate Church of Southwell, after having escaped the rapacity of Henry VIII. and the followers of Edward VI., and has come down to us almost unimpaired in its essential features from very nearly the earliest historical times, should in these days have its identity destroyed, and its value as a national record placed in jeopardy by a mistaken zeal for restoration.—I have the honour to remain, my lords and gentlemen, your very obedient servant,

(Signed) WILLIAM MORRIS, Hon. Secretary.

Ecclesiastical Commission, 10 Whitehall Place,
London, S.W.: July 3, 1878.

Sir,—The Ecclesiastical Commissioners for England have had before them the communication dated April 17 last, which, on behalf of "The Society for the Protection of Ancient Buildings," you addressed to this Board with reference to Southwell Minster; and I am now directed to transmit to you the accompanying copy of a report which the Commissioners have received from their architect, Mr. Ewan Christian, upon the above-named communication, and to state that the Board concur in the views expressed in that report.—I am, Sir, your obedient servant, GEORGE PRINGLE.

William Morris, Esq., 26 Queen Square,
Bloomsbury, W.C.

SOUTHWELL COLLEGIATE CHURCH—FABRIC REPAIRS.

8A Whitehall Place: June 18, 1878.

Dear Sir,—In reply to the memorial of "The Society for the Protection of Ancient Buildings," addressed to you by Mr. Morris in April last, I beg to observe:—

1st. That as regards the fabric since the work of repair has been under my hands no alterations whatever have been made "destructive" either "of artistic or historical character," but the works executed have been strictly those of careful restoration. The removal of certain windows inserted in the eleventh century in the aisles of the nave, and the substitution of other copies of the ancient Norman window in the north aisle, was carried out under the late Archdeacon Wilkins, and the process was immediately stopped when the work of repair was put under my direction.

2nd. That as regards the fittings of the choir, which the Society admits "were of no great value," and "modern and poor in quality," I cannot allow that they were either "adequate to the requirements of cathedral service," or in any respect worthy to remain in a structure like Southwell Minster. They were, in fact, the thinnest kind of common pew framing, and, excepting the outside fronts, wholly of deal.

The Society would, I presume, have also advocated the retention of the galleries in the aisles erected at the same time as this pewing, the removal of which has alone enabled the beautiful aisles to be seen.

As regards the side screens, which the Society considers to have been "very interesting," I can only say that they were not removed without most careful consideration, and after Mr. Street's opinion had been taken by the Bishop. They were copies in cement of the stone screen across the choir, very well modelled, it is true, executed by Bernasconi in the early part of this century, but put together in a most flimsy manner; and I cannot agree with the Society in regretting their loss.

3rd. As regards the roof of the nave, I differ entirely with the Society. Mr. Morris correctly states that the present roofs of the nave and transept were erected after the fire of 1711, and further says that "the Norman nave was in all probability covered originally with a flat roof, similar to Gloucester and St. Albans; this was replaced in the Middle Ages by a pitched roof, but we have no evidence to show that the alteration was an improvement, but on the contrary, the subsequent removal of this roof and the substitution of a flat roof tends to show that its effect was not found satisfactory."

If Mr. Morris would take the trouble to examine the central tower he would at once see that the original Norman roof of the nave at Southwell could never have been flat, and he would further see that the ancient roof was exactly of the pitch of that which it is proposed to restore, and that there is no evidence whatever of any intermediate roof having ever existed. Hollar's engraving is not sufficiently accurate to stand against the evidence afforded on this point by the building itself.

I disagree also with the Society as to the value of the existing flat ceilings, which dwarf the church and have no intrinsic beauty of their own to recommend them. Mr. Morris says that the restoration of the Mediæval roofs must be entirely conjectural, which in one sense is true, but the openings in the tower show clearly what was the level of the collar beams, and there can be very little doubt as to what was the form of the ancient framing, excellent examples of which still remain. My own view, and that of other persons interested in the church, so far as I can gather, is that the substitution of open roofs of massive timbers covered with lead, such as I propose, would be an enormous improvement to the interior, and would in no way lessen, but rather improve, the external outline of the church. The flattening of the roofs after the fire was much more probably owing to economical reasons than to any considerations as to satisfactory effect. They were simply made of the cheapest and rudest form consistent with strength and the exclusion of water.

It is no part of my design to remove the raised portion of the roof at the western end, which Mr. Morris calls the lantern; this is not necessary, but I cannot understand why, if the Society which Mr. Morris represents so strenuously advocates the retention of this raised roof, they should object so strongly to the removal of the flat ceiling to the eastward of it.

The roof at this end was really raised for no other reason than to clear it of the great west window, the tracery of which the low modern roof would have cut right across.

In conclusion I would say that no alteration contemplated by the Commissioners' instructions will in any respect tend to the "destruction of the identity of the Collegiate Church," for the value of which "as a national record" they probably have quite as high a regard as any member of the Society; and so long as it is entrusted to my care I shall, as I have always done, jealously guard it from injudicious change.—I am, dear sir, yours faithfully, EWAN CHRISTIAN.

The Secretary, Ecclesiastical Commission.

The Society for the Protection of Ancient Buildings,
26 Queen Square, Bloomsbury: July, 1878.

Dear Sir,—The Society for the Protection of Ancient Buildings has had under consideration your architect's observations in reply to the letter addressed to you in April last.

The Society is glad to find that the building is in charge of an architect so careful and conservative as Mr. Christian, though it disagrees with the opinions expressed in his letter. Bearing in mind the objects of the Society, this letter is neither satisfactory nor reassuring. Believing that your architect concurs in its estimation of the responsibility which attaches to the custodians of a national record such as Southwell Minster, and of their obligation to preserve it from change, the Society brings the following further remarks to the notice of your Board.

As regards the fittings of the choir the Society still remains of opinion that, poor though they were, they fulfilled the requirements of the service of the church by providing seats for clergy, singers and people. If stalls and benches of oak and tiled floors be requisites of cathedral service, the Society must acknowledge these were lacking.

As to the removal of the galleries, the Society thinks it was unnecessary. It is true that the galleries which existed in the

choir aisles hid some of the architecture, but in a church like Southwell, which was never intended to be seen from base to apex in the naked way modern restorers seem to think becoming, they concealed nothing that is not sufficiently expressed elsewhere. The galleries, screens, tombs and such like obstructions impart a fitted look to a big building—they help to give a homely and inhabited appearance to the edifice, and it is their removal and destruction that has made so many of our large churches so cheerless.

The loss of the side screens is a more serious one, and the Society again expresses its regret at their removal. Your architect admits they were well modelled, he does not allege they were in bad repair, but says they were only removed after most careful consideration, and after Mr. Street's opinion had been taken by the Bishop, and that they were put together in a most flimsy manner. The Society urges that this is no justification for their demolition. It understands Mr. Street also advised the removal of the fourteenth-century screen, and it regrets that the same influence was not used to save the side screens that prevailed against Mr. Street's opinion in the other case.

As regards the roof of the nave, the Society does not dispute that the marks on the central tower and the moulded arched openings below, of which it was aware when its letter was written, indicate the former existence of a high-pitched roof, but the timbers of this were in all probability concealed internally by boarding. It does dispute the existence of an open roof, meaning thereby a roof the timbers of which were visible from the nave of the church.

No adequate reason is given in your architect's letter for the necessity for new roofs. He disagrees with the Society as to the value of the flat ceilings, which he considers dwarf the church; says that the roofs were made of the cheapest and rudest form consistent with strength, and that his view and that of most persons interested in the church is that the substitution of open roofs would be an enormous improvement to the interior. Here is no justification for the removal of the present roofs and flat ceilings, the latter of which, in the Society's view (the Society numbering many persons also interested in the church), have an excellent effect, are broad and simple in design, and, though in later style, agree with the architecture of the church. The Society hopes your Board will give further consideration to this matter, and not needlessly remove the existing roofs for the sake of what is a very problematic improvement.

The Society's opinion that the restoration of the Mediæval roofs must be entirely conjectural is not disputed by your architect, who, by means of the indication of the level of the collar beams, the lines showing the old pitch on the central tower, and examples of ancient framing, proposes to substitute open roofs for the existing ones, thus destroying a ceiling 167 years old, which is probably unique, to add one more to the many imitations of ancient roofs which have of late years been so freely produced.

Your architect cannot understand why the Society should advocate the retention both of the flat ceiling and of the "lantern" at the western end, which he says it is no part of his design to remove. It does so because it wishes to save both the "lantern" and the flat ceilings. No doubt the roof was raised over the western bay for the reason your architect states. The builders took advantage of the peculiar conditions to do something striking and characteristic. A roof of higher pitch than the present one would cover over the "lantern" and enclose the great west window, thus doing away with the necessity that originated the "lantern," which without the flat ceiling would be both useless and meaningless.

May the Society suggest that if the present roof timbers and their covering be unsound, or if the pitch of the roof be insufficient for slates (though your architect in his reply does not say so) they might be repaired or renewed, or the exterior covered with lead, without the demolition of the flat ceilings? More urgent reasons than are given for the removal of the old roofs and ceilings are necessary to satisfy the Society that it is not possible to preserve them.

The Society thanks your Board for giving it the opportunity of explaining its views at greater length.—Believe me, yours faithfully, (Signed) WM. MORRIS, Hon. Sec.

The Secretary, Ecclesiastical Commission.

Ecclesiastical Commission, 10 Whitehall Place,
London, S.W.: April 4, 1879.

Sir,—With reference to your letter of the 29th ultimo, I am directed by the Ecclesiastical Commissioners for England to inform you that the previous communication received on July 30, 1878, from the Society for the Protection of Ancient Buildings, was laid before the Commissioners on August 1 last, but that they did not feel it necessary to consult their architect further upon the subject, and they regret that they must decline to continue the correspondence.—I am, sir, your very obedient servant, GEORGE PRINGLE.

T. Newman Marks, Esq., 9 Buckingham Street, Strand.

THE USHER HALL, EDINBURGH.

A REPORT has been prepared by the town clerk and city architect of Edinburgh regarding the proposed sites for the Usher Hall. These sites were:—(1) High Street and St. Giles Street; (2) Chambers Street and Lindsay Place; (3) George Street and Castle Street; (4) Melville Street and Stafford Street; (5) Atholl Crescent and Canning Street. Of the five sites only two—viz. those at High Street and Atholl Crescent—would be suitable for an elliptical form of hall. In the case of the High Street, the hall itself might be elliptical, while the exterior might be rectangular, so as to give more accommodation around it. The report says the High Street and St. Giles Street site has a frontage to the High Street of 250 feet, and to St. Giles Street of 212 feet. Its extent is about 6,000 square yards. Valuation, 118,268*l.*; rate per square yard, 19*l.* 14*s.* 2*d.* This site contains properties already belonging to the city, and partly occupied by city departments. Accommodation might be found for offices in parts not required by the hall. The new buildings on this site could be connected with the present City Chamber, Chambers Street, and Lindsay Place site has a frontage to Chambers Street of 156 feet, and to Lindsay Place of 192 feet, and if limited to the area north of Bristo Port Lane covers 3,858 square yards. It would be desirable if, by arrangement with the museum authorities, a street or passage could be left between the proposed building and the museum building from Chambers Street to Bristo Port Lane. There would thus be streets on all four sides of the hall building. The buildings at present on this site project beyond the general lines both of George IV. Bridge and Bristo Place. After giving off ground to straighten these lines of streets, there would still remain sufficient space for a hall to accommodate an audience of 3,500 or 4,000 persons, but with considerably less space for adjuncts than on the other sites. Regarding the George Street and Castle Street site, it is stated that there would be sufficient space for a hall, with two galleries, to afford accommodation for from 3,500 to 4,000, with the requisite adjuncts. The extent and other general conditions of Melville Street and Stafford Street site are not greatly different from the George Street site. Atholl Crescent and Canning Street site would afford space for a building either of elliptical or rectangular form on an ample scale. If the elliptical form were adopted, two of the houses in Atholl Crescent frontage might be retained with some modification of their background, and a considerable saving on the cost of the site thus effected; while the main body of the building being to some extent screened from view externally, a less costly style of treatment might suffice than where more fully exposed to view. The following abstract appended to the report shows exactly at what price the reporters estimate the sites:—

	Extent.	Valuation.*
1. High Street and St. Giles Street	6,000 sq. yards	£118,268
2. Chambers Street and Lindsay Place	3,858 sq. yards or 6,438 sq. yards	41,642
3. George Street and Castle Street	4,489 sq. yards	75,252
4. Melville Street and Stafford Street	4,478 sq. yards	78,427
5. Atholl Crescent and Canning Street	7,230 sq. yards	58,113
		59,161

* Valuation includes capitalised feu-duty or ground annual, and business compensation.

PLAYING-CARD DESIGNS.

THE Court of the Worshipful Company of Makers of Playing Cards on Monday adjudicated upon the 236 designs sent into the recent competition instituted by the company for the best designs for the backs of playing cards to be issued by them during the coming year. Three prizes were awarded, the first, the H. D. Phillips prize, being given to Mrs. J. E. Cook, Highfield, Wantage; the second to Mr. John Vinycombe, of Holywood, county Down, Ireland; and the third to Miss S. Ruth Canton, 6 Beaumont Street, W. The design of Mrs. Cook will be reproduced for presentation by the company to their guests at the Master's and Wardens' inauguration banquet in December. The Court highly commended the designs sent in by the following competitors:—Miss M. W. Thompson, Park Gate, Guisley, Leeds; Mr. R. W. Higham, Tytherton Road, Tufnell Park, N.; Mr. R. Quiller-Lane, 73 Hammersmith Road, W.; Mr. N. Van-der-Lyn, 16 Colherne Mansions, Bolton Gardens, W.; Miss Elsie Hall, Melton Lodge, Havelock Road, Croydon; Miss Hunter, 62 Cleveland Square, Bayswater; Miss Ellen C. Griffith, Whyteleafe, Surrey; Miss M. A. Ramsay, Balmam, Goodrich Road, Dulwich; Mr. F. W. Herrington, 61 Grafton Street, Fitzroy Square, W.

Mr. Holman Hunt and Mr. Alfred Gilbert, R.A., have been elected honorary members of the Royal Society of British Artists. At a general assembly of the Society held on Monday last, Mr. Wilfrid Ball, Mr. Archibald Christie, Mr. Tom Browne and Mr. Georges were elected members.

NOTES AND COMMENTS.

Although the National Gallery in Sydney only dates from 1876, the estimated value of the collection is already considerably above 100,000*l.* The water-colour drawings are considered to be the finest out of England. Study in the gallery is permitted under certain conditions. The number of students registered is 266, of whom 18 were admitted in 1897. Interchanges of pictures on loan between the National Galleries of Sydney, Melbourne, Adelaide and Brisbane were initiated in 1894. This movement was carried on continuously up to July 1897, when the resources of the Adelaide and Brisbane galleries became exhausted. At the instance of the New South Wales Minister of Public Instruction, the trustees selected and despatched in 1895-96 for exhibition at the technological schools of Newcastle, Bathurst and Goulburn, three collections, containing in all 44 pictures, which were supplemented by valuable contributions of examples of Australian art, and lent under the auspices of the Art Society of New South Wales. The pictures are interchangeable between the three centres named.

The University of Cambridge continues to be enriched by gifts for scholarships and prizes. Quite lately a bequest of 10,000*l.* has been received under the will of the late A. W. G. Allen for the establishment of a scholarship or prize in memory of the Right Rev. Joseph Allen, D.D., formerly Bishop of Ely, and grandfather of the donor. That is only one among several examples. But as Vice-Chancellor Hill, the master of Downing, pointed out on Saturday, there is at the present time a greater need for the provision of buildings for university purposes than for the encouragement and stimulation of students. The admirable and central sites which have been purchased by the University during the last three years are still entirely unoccupied, although many departments of the University are either overcrowded or most inadequately housed. The necessity of accommodation has become so urgent, the authorities of the schools of law and medicine, feeling that it is impossible to wait until the general resources of the University allow of the provision of new buildings, have opened subscription lists on their own account. A sum of 6,000*l.* has been gathered, of which a large part was subscribed by professors and other residents in the University. It would almost appear as if the influence of tradition was an obstacle to an interest in buildings. The old colleges were erected by individuals, and it may still be imagined it is the duty of individuals to supply the buildings which are needed for the realisation of modern aims.

We are amazed at the indifference of those who are responsible for the conservation of Mangotsfield Church to the charges which were made in the Shipway case. We have nothing to do with the parties concerned or with the issue of the inquiry. All we wish to point out is, the tombs and graves and sculpture, and in fact whatever was supposed to facilitate the scheme of one of the parties, were allowed to be tampered with without any restriction. It is true that the visitor who is charged with taking the principal share in the work stated that he possessed authority from the Home Secretary to make any investigation which he considered necessary. Apparently, however, no one connected with the church demanded to see so important a document. It is sometimes necessary that researches should be allowed in church registers and inscriptions copied from tombs, for in that way important evidence may be obtained, but to move tombs, to change their contents and to alter the position of figures should not be tolerated, or if such transformations are indispensable then faculties should be obtained, and the operations conducted under proper superintendence.

The church of St. Louis, at Poissy, near St. Germain, in itself is a most interesting Norman and early thirteenth-century structure, with late fourteenth or early fifteenth-century north aisle. It still possesses the interesting fragments, much worn, of the font at which St. Louis, King of France, was baptized. They are now enclosed within a small wrought-iron grille, bearing a diminutive brass plate with an inscription commemorative of the fact. The church itself is fairly lofty and very bold, with no transepts, but with chapels round the choir; but perhaps the most striking features of the great church are the two towers. At the west end a gigantic six-storeyed Norman tower is surmounted by about 20 feet of a square stone spire, whence rises an octagonal stone lantern, in turn crowned by a stone spire. The other Norman tower rises from the end of the nave, and is octagonal, the big nave roof rising on the western side to within a few feet of the top of the tower and the base of its lofty spire *en charpente*. There is also a fine, but dilapidated projecting south porch, open on three sides, close to the west end, of the fifteenth century. The choir roof is several feet lower than that of the nave, and flying buttresses with pinnacles connect the south wall of the nave with the porch just mentioned. Poissy is only three-quarters of an hour by train from the St. Lazare Station of Paris, and is on one of the lines to Mantes. It is also on the Grande Ceinture line and close to St. Germain, with which it is in constant communication by steam tram. The town itself is irregular, badly paved, and, excepting the church, utterly devoid of interest.

To all bibliophiles "Book Prices Current" (Elliot Stock) is one of the most welcome of volumes. This year they will be pleased at receiving it at the beginning of October instead of waiting until next January. The change has been rendered necessary because the auction year of which it is the record closes in September, and subscribers cannot wait a day longer than is necessary. Although fewer libraries were sold during the last season, yet between December 1897 and July 1898 the amount realised in auction rooms was 92,857*l.* So large a sum was in some measure owing to the second and final portions of the Ashburnham Library. The average per lot was 2*l.* 15*s.* against 2*l.* 13*s.* 9*d.*, last year's average. Architectural books brought fairly good prices. Fergusson's "History," in four volumes, was sold for 4*l.*; Mr. Street's "Gothic Architecture in Spain," 3*l.* 3*s.*, and his "Brick and Marble in the Middle Ages," 1*l.* 18*s.*; Viollet le Duc's "Dictionnaire Raisonné de l'Architecture," 7*l.* 12*s.* 6*d.*, and his "Mobilier Français," 6*l.* 17*s.* 6*d.*; Turner's "Domestic Architecture," 2*l.* 10*s.*; Parker's "Glossary," 2*l.*; Kent's "Designs by Inigo Jones," 2*l.* 19*s.*; Darly's "Compleat Body of Architecture," 2*l.*; Walter Geddes's "Booke of Sundry Draughtes," 14*l.*; Létarouilly's "Edifices de Rome," 8*l.* 2*s.* 6*d.*; Pricke's "Ornaments of Architecture," 6*l.* 12*s.* 6*d.*; Serlio's "First Booke of Architecture," 7*l.* The volumes of archæological societies were also well appreciated. Like the preceding volumes, the latest is admirably arranged and indexed, and does credit to Mr. J. H. Slater's care and to the publisher's good taste.

The Canadians are showing loyalty by seeking professors of architecture and engineering in this country. The latest appointment is that of Mr. E. G. Coker as assistant professor of civil engineering in McGill University, Montreal. Mr. Coker is not only a graduate in engineering of Edinburgh University, but he has had an unusually extensive training in experimental engineering in the laboratories of the Universities of Cambridge and Edinburgh; Owens College, Manchester; University College, London; King's College, London; Finsbury Technical College, and the Heriot Watt College, Edinburgh. In 1896 he was offered the senior professorship of mechanical engineering in the Worcester Polytechnic Institute, but declined the appointment in order to pursue further studies at Cambridge. In Montreal Mr. Coker has plenty of scope to exercise his abilities.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

Introduction.

THE subject of church architecture in France—closely allied as it is with that of our own country in certain districts—is one exhaustible in its extent and interest. Grand as it is, and in not a few respects worthy of imitation among ourselves, French architecture must not be indiscriminately admired or regarded, as too many do, with a blind faith; for while the cathedrals and churches of France are, generally speaking, conceived on a more gigantic scale than our own, they present fewer varieties and blendings of style, besides being less interesting historically, and I may also add, less truthful and lovable.

It was not until the thirteenth century that France was compacted out of a number of States or divisions, each distinguished by peculiarities, which were retained long after these provinces were welded together under St. Louis and Philip Auguste into a kingdom, which then, as now, had for its centre the Ile de France, *i.e.* the country immediately surrounding Paris. Even when this was accomplished these provinces retained much that was peculiar, even to their architecture, so that in this respect at the present day each affords a distinct field for the pursuit of ecclesiology, as much difference existing between the Romanesque of Provence and Normandy, between the First Pointed of Anjou and Burgundy, as between the Early English of Wells Cathedral and the Yorkshire abbeys, and the Perpendicular of Somerset and that of the Eastern Counties.

The Société des Monuments Historiques has published an architectural map of France, showing it to have been the home of no fewer than thirteen provincial styles. Most important among these are the style of the Ile de France or Domaine Royale; the style of Normandy; those of Burgundy and Auvergne; that of Provence; of Languedoc, Poitou and Saintonge, all included in Aquitania; the Angevine style, marking a small district on both sides the Loire between Aquitaine and Normandy; and, lastly, though not a very important one, that of the extreme north-east bordering on the Rhine and Belgium. Gradually blending tints in lieu of sharp lines explain the boundaries of these styles, which in some instances overlap each other, for the influence of each province was felt by its neighbours, and this most forcibly in frontier regions.

Beginning with the South of France, it may be observed hat the long continuance of Roman civilisation there, and, as a natural consequence, the large number of buildings erected in imitation of Roman remains, besides the early existence of a colony of Greeks who left numerous churches, Byzantine in plan and construction, are sufficient reasons for our finding the greater part of its cathedrals and churches Romanesque in style. But it would be tedious to point out the various niceties and distinctions existing between the Romanesque of Provence and the Auvergnat, and the Transition of Aquitaine and Anjou; briefly, therefore, the architectural peculiarities of these provinces must be pointed out, leaving the reader to glean more detailed information from Fergusson's "Ancient and Mediæval Architecture," one of those fascinating books which can only be laid aside with reluctance when once in hand, or from Petit's "Architectural Studies in France." The especial value of the latter was that it opened to the architect and ecclesiologist several new and unusually rich fields of study, such as the Touraine and the Auvergnat, with the advantage of an intelligent practical commentary on the examples adduced. The larger number of illustrations were engraved on wood from the drawings of Delamotte, and these with respect to scientific accuracy and artistic beauty leave nothing to be desired. Other plates are anastatic reproductions of the author's own sketches—too roughly and hastily executed to be useful in matters of detail, but so admirable in their representation of broad outlines and general picturesque effects as to render the subjects recognisable in a moment. A view across the nave of the cathedral at Autun, St. Basile at Etampes, St. Sernin at Toulouse, and the church at Langrune, near Caen, being a few among the subjects that engaged Petit's fertile pencil.

The Romanesque architects of the southern French divisions—Provence, for example, centring at Arles, Avignon and Fontefroide—were quite content with their style, giving themselves up to the endeavour to refine and adorn it, unlike those of Normandy and the Ile de France, districts showing, like our own, a constant striving after further development.

In a word, the Pointed styles, although they attained to a certain point in these southern regions, either stood still or became imported, never being carried to that perfection so observable in the north. This southern character of Romanesque and Transitional, with its imitation of Classical detail, its domical roofs, barrel vaults and generally speluncar character, may be said to extend considerably above that generally acknowledged architectural boundary line—the Loire—as far as Le Mans, where we see it in the church of Notre-Dame de la Couture, and in the opposite direction as far as Langres. Within the limits of Provence, which occupies the whole valley of the Rhone as far as Lyons and along the coast between the hills and the sea towards the Pyrenees, there is barely one church that can be called Gothic. Some are so purely Romanesque that, although they date but from the age of Charlemagne, they rival some of the finest buildings of imperial Rome in classical purity of detail. Others show a more Gothic tendency, as, for instance, St. Trophimus at Arles with its noble porch and its cloisters, which, as well as those at Fontefroide, are lovely specimens of Romanesque work in which their architects revelled in freedom from restraint, and where parsimony of care and pains is imperceptible. The churches of Alat, Aix, Cuxa, St. Gilles and Tarascon are remarkable chiefly for their porches, while a lovely doorway in the fortress-like church of Magnelone has quite a Saracenic air.

In Aquitania, the richest field for the study of the Romanesque of that province is the department of Charente, with Angoulême for its centre. What an architectural feast is here spread forth by such churches as Châtres, Monthiers, St. Amande de Boix, Roulet, Trois Palis, Plassac and Le Palud, gloomingly grand structures upon whose western façades their architects lavished so much skill.

Still further south we find the great five-aisled church of St. Sernin at Toulouse, Périgeux, Roulet and Souillac. Round arches and tunnel vaults, pointed arches and domical roofs are features peculiar to the churches of this province—more remarkable, perhaps, for grandeur of conception than for the success attendant upon their achievement.

Proceeding northwards, we find in Poitou, Anjou and Touraine, with their capitals, Poitiers, Angers and Tours, a much more delicate handling of both Romanesque and Pointed forms than in Aquitaine. Absence of aisles is a striking feature of many Romanesque and Transitional Angevine churches, a peculiarity depriving them of that mystery derivable from the interminable perspective of the piers and arcades of the more advanced Pointed examples. The cathedral of Angers, St. Martin and La Trinité in the same city; Blois, Loches and Fontevrault are noble types of Angevine First Pointed.

The Auvergnat Romanesque—a school with as distinct and marked a tradition of its own as that of the Rhine, Lombardy and Normandy—is extremely beautiful. The western narthex, with or without a gallery, and the apsidal east end with one pair of chapels to the north-east, another to the south-east, and an apse to each transept on its eastern face, are characteristic features of churches in the Auvergne.

They are, however, unlike Noyon or Tournai, rarely or never transverse triapsidal. Issoire, Notre-Dame du Port at Clermont-Ferrand, the cathedral of Le Puy and St. Etienne at Nevers—the last somewhat distant, but partaking of all the peculiarities of the Auvergnat style of Romanesque—are specimens most worthy of citation. Another feature in the churches of the Auvergnat is the use in their construction of different coloured materials for external ornamentation, such as tiles inlaid in stone in the face of the wall, patterns formed of white stones and black lava from the neighbouring volcanic region—a system of natural polychromy very grateful and refreshing to the eye.

It cannot be doubted that the magnificent Roman monuments preserved in Arles, Nismes and Orange gave something of a classical character to the church architecture in their own neighbourhood—a peculiarity to be found in such churches of the dioceses suffragan to Lyons as Autun, Langres, Saint-

Claude and Grenoble. In the naves of Autun and Langres cathedrals the pointed arches separating them from the aisles spring from fluted pilasters with Corinthian capitals. Ionic columns appear in the apse of the cathedral at Lyons, and Corinthian ones, fluted, support pointed arches in the apse at Beaune, between Dijon and Autun. At the angles of the octagon of Avignon and in the tower of the abbey at Tournus Corinthian pilasters occur; indeed, the Auvergnat and Burgundian churches present manifold examples of Classicism, which, by the way, must not be confused with the vandalisms committed during the eighteenth century in the apses of Bayeux, Fecamp, Lisieux, Chartres, and in other northern cathedrals.

Burgundy is a most interesting province architecturally; indeed, its Early Pointed style, as exemplified in the abbey churches of Pontigny and Vézelay, the choir of St. Etienne at Auxerre, and the churches of Semur and Notre-Dame at Dijon, is quite *sui generis*. In the last-named city the original cathedral of St. Benigne was one of the oldest in Burgundy, and doubtless afforded an excellent example of the Romanesque of that province; but its total destruction at the Revolution, and the insufficiency of plates illustrating it, published by Dom Plancher, preclude our gaining any satisfactory idea of it. Open western porches of great height, with or without storeys above them, as at Autun, Beaune and Notre-Dame, Dijon; great ante-churches or narthexes, as at Vézelay; absence of aisles to the apse, but the employment of smaller apses on the eastern sides of transepts; closed triforia; and the cylindrical column, with its caps foliaged in a bold, papyrus-like style, are among the most prominent peculiarities of Burgundian Gothic.

The abbeys of Citeaux and Cluny, Pontigny, Charité-sur-Loire, Tournus and Vézelay attest the fact that, for some unexplained cause, Burgundy early became the favourite resort of hermits and holy men, who founded here these great monastic establishments which spread their influence, not only over France, but over the whole of Europe, controlling to a most extraordinary extent all the relations of Mediæval European society.

Some of these great establishments have almost entirely disappeared; for example, Citeaux and Cluny. The church of the latter was the grandest in Europe, being, within a few feet, as large as St. Peter's at Rome, and possessing five aisles, double transepts and seven towers.

Pontigny, Souvigny (near Moulins-sur-Allier, and although not actually in Burgundy—belonging to the Bourbonnois—sufficiently near to be included in this great group), Tournus and Vézelay still retain their enormously long churches, but the busy courts which whilom surrounded them now lie desolate.

In other provinces neighbouring to Burgundy—*i.e.* Berri, the Nivernois, the Bourbonnois, Touraine, Maine, and the Orleannois—provincialisms must not be looked for in such great cathedrals of those divisions as Bourges, Nevers, Tours, Le Mans and Chartres, belonging as they do to the great church-rebuilding ages, the twelfth and thirteenth centuries, but among the churches of the smaller towns and villages.

Those of Blois, Loches and Meungs in the Touraine present specimens of First Pointed detail hardly surpassed for elegance of effect and delicacy of execution. Both here and in the contiguous Orleannois we meet with the square Eastern termination, as in St. Julian and Notre-Dame de la Riche at Tours, and in three of those fine churches which render Etampes so delightful a place for a brief sojourn. Churches in the Orleannois, especially in that district of it known as La Beauce, cluster almost as thickly as in Leicestershire. Travelling from Orleans to Etampes—whose churches, by the way, seem to form a sort of frontier line between the architecture of northern and southern France—the almost universal saddleback steeples of its village churches form the only relief to this *pays ennuyeux*, as La Fontaine termed this, the granary of France.

(*To be continued.*)

An Ornamental Footbridge over the river Wye, connecting Hereford Castle Green with the meadows opposite, in honour of the Diamond Jubilee of the Queen's reign, was opened on the 29th ult. The reason of the delay in the work was the engineers' strike. The cost of the bridge was 1,200*l.*

THE SANITARY INSTITUTE.

IN the Section of Engineering and Architecture at the Birmingham meeting of the Sanitary Institute Mr. William Henman presided. In his address he described the important part taken by architects in the question of sanitation. Engineers and architects were, he said, the active agents by whom sanitary science was practically applied in permanent works for the benefit of mankind. The function of architects was not alone to produce artistic designs and decorations, but by a careful application of sanitary science, a knowledge of natural laws, of the nature and properties of building materials, of the earth's surface on which they built and of the air they all breathed, so to design and construct the edifices they erected that, without being devoid of suitable artistic expression, they might be convenient in arrangement, safe in construction, free from sanitary defects or such as might cause bodily hurt, mental trouble or untimely death. That the public had not always, and did not even now in every case demand this, must be evident. Too often, through ignorance, or on grounds of false economy and favouritism, was the 'prentice or inexperienced hand employed. Consequently, as individuals either could or would not take care that safe and healthy buildings were erected for their use, the Legislature had stepped in, and by various Acts of Parliament, local by-laws and various officials endeavoured to safeguard individuals and communities. The effect of this system was perhaps as good as could be expected, but it appeared to him unduly to relieve many of personal responsibility which it would be better they should bear; but the greatest evil was the lack of impartiality in administration apparent in some localities, so that, instead of inspection and regulation, there was too often dictation and interference at the caprice of authorities or their officials, who might consider they had a right to interpret by-laws as they pleased, whether or not safety or health was in question. Moreover, in matters of sanitation there was much yet to be learnt, and there was reason to doubt the wisdom of many regulations which had from time to time been laid down in connection therewith. There seemed to be a law of evolution in sanitation as in many another subject. Probably the greatest obstacles to the advance of sanitary science were popular prejudice and the unreasoning adoption of materials, means and methods which might be good under certain circumstances or conditions, but the cause of evils when wrongly applied or employed. Mr. Henman said he believed that the day would come when all "interceptors" and "traps" would be abolished, and with them the sewer-gas which they retained about dwellings. With good ventilation of house drains, air inlets to sewers, ample flushing, impervious and well-laid drains and sewers, all entrapped and free from obstruction, that gas might become a thing of the past. Engineers had sinned deeply in the construction of sewers. Apart from their general design, the method of construction and gradients adopted, the work had too often been defective in execution, so that, instead of aiding the quick removal of solids by water carriage, they had acted as filters or separators, permitting the fluids to escape and soak into the ground, or to run off and leave the solids to fester and become offensive. A new era in sewage disposal might be at hand if the "septic tank" fulfilled the promise of its rapid advance in public estimation. If what was claimed for that tank held good, a dual arrangement of sewers and storm-water drains would not be necessary. With regard to building materials the use of glazed materials was often advocated for the exteriors as well as the interiors of buildings. Many architects, however, preferred materials of permeable construction. Ventilation was another subject glibly talked of and much misunderstood. Failures in applying mechanical means for sewering ventilation in large buildings was in his opinion traceable to three causes:—(1) Too low an estimate of the volume of air required; (2) want of efficient mechanical appliances; (3) want of constant and intelligent management. So long as architects and the public shut their eyes to the ascertained fact that a change of air from seven to ten times per hour was essential for health and comfort, failure must inevitably result. Good health could not be secured in defective dwellings. Among the labouring classes the home was often defective. The reason was to be found in the system of existing ground-rents. The excessive value put on land for building purposes, particularly that required for the houses of the working classes, was a leading cause of bad building.

House Drains.

A paper by Professor A. Bostock Hill on the construction and ventilation of house drains was next read. He held that as to the size of drains, the smallest that would convey the necessary quantity of liquid was certainly best for purposes of cleanliness. The use of too large pipes was attended with grave disadvantages, such as the collection of putrefiable matter and the difficulty of flushing. The traps which, under the law, were commonly put at each junction of the sub-drain held a

considerable quantity of liquid and solid matter, and for the time being became a small depositing tank where solids in suspension precipitated themselves. The ventilation of sewers up private houses Dr. Bostock Hill regarded as a danger to health, and he protested against the method as utterly wrong in principle. He likewise protested against some of the systems of public sewering, which, instead of preventing the formation of noxious gases, tended to bottle them up and discharge them some few feet above the roofs of private houses.

Mr. Joseph Priestley discussed in a paper the subject of combined drainage. In practice he would restrict the number of houses allowed in a combined drain to six or less, and have the combined drain itself intercepted and ventilated separately. But with more than six houses the main drain became a sewer, and each house drain separately intercepted therefrom and ventilated. Where the system of drainage was simplified and the drains kept outside by means of a combined system, it ought to be allowed, instead of a separate drain being insisted upon. When six or fewer houses were combined, the combined drains were to be intercepted and ventilated separately as a whole; but where more than six houses joined the main drain had better be treated as a sewer, and each house separately intercepted therefrom and ventilated. The pros of combined drainage were many and the cons few.

In the discussion which followed on the last two papers, Mr. Henman expressed pleasure that the evils arising from the multiplication of taps and the interception of sewage and drains were being more clearly recognised. They were a result of the "model" by-laws of the Local Government Board. These by-laws were certainly not the best, but a very long way from it, and he hoped that a very strong feeling would be raised at that congress to show the Local Government Board that those regulations ought to be put into the waste-paper basket and fresh reasonable ones adopted in their place.

Mr. Close contended that outside traps should be abolished, but inside traps were necessary. Fresh-air inlets should be abolished, and ventilating pipes should be put in on the sewer side of the ventilating tap.

Mr. A. S. Campkin did not agree with the objections that had been made against the dispersion of sewage-gas about the roofs of houses.

Mr. Lewis Angell stated that in West Ham they had succeeded in throwing the cost of combined drains on private owners.

Mr. Sydney R. Lowcock admitted that many of the Local Government Board by-laws were obsolete, but he did not agree with the entire abolition of them.

Mr. Ernest Day advocated a system of exhaust shafts for sewers, passing the gases through destroyers.

The President thought they had to direct attention to the fact that it was possible to prevent the formation of sewer-gas. Fresh sewage did not give off gas, but in the traps, one to every house, were many gallons of putrefying matter, which at every flush was thrown into the sewer and produced gas. If there were a continuous flow through the sewers of Birmingham, and no places where matter could rest, the sewage would be discharged at Saltley before it had begun to give off gas.

Dr. Bostock Hill said he was opposed to the adoption of the exhaust system. With the hundreds of miles of sewers there were in Birmingham it was impossible to get the necessary draught; the sewers were not air-tight, and the expense would be prohibitory. Moreover, the principle was wrong. They must prevent the formation of the gas, and the rearrangement of the sewers for that purpose was one of the greatest problems which Birmingham and other large cities had to face in the future.

The concluding paper, read by Mr. A. Bertram Nichols (Birmingham), dealt with "Sewage Disposal in Connection with Tidal Waters," and led to considerable discussion by the representatives of a number of seaside towns.

The Prevention and Pollution of Streams and Rivers.

Dr. Christopher Childs, London, gave a lecture on "The Prevention of Pollution of our Streams and Rivers." The president (Sir Joseph Fayrer) presided. The lecturer said that in 1876 the Legislature passed the Rivers Pollution Act, for the purpose of putting a stop to the pollution of the rivers and streams, but it was generally admitted that the Act had failed in accomplishing the object for which it was designed, and that pollution had continued unchecked in defiance of the law and of the many efforts to reduce it. The chief difficulties in the way of reform were the ignorance and indifference of the people, the great cost of sewage purification and the uncertainty with regard to the best means to be employed, and also the defects in the law and the impotence of the measures provided for its administration. Ignorance and indifference might be dispelled by education and researches, and practical results obtained by scientists plainly demonstrated that the great difficulty, uncertainty and cost of purification, which had blocked the way for so many years, had been in a large measure due to our misconception of the true principles by which we should be guided in dealing with domestic sewage. The chief object of the purification of sewage and refuse was to secure that the effluent from any sewage manufacturing process or filth accumulation to any stream should be purified in such a way that it should not cause the water of the stream to be poisonous or dangerous to the health of those who drank it, nor be detrimental to the manufactures for which it might be used, offensive to the sight or smell, destructive to fish nor obstructive to the flow of the stream. Of those conditions, that which made the water poisonous or dangerous to the health of those who drank it was the most important for consideration. It was generally accepted that water polluted by sewage was always dangerous to health, and frequently the actual cause of outbreaks of cholera and typhoid fever. But it did not follow that the quantity or quality of organic matter which was dissolved in the water determined those outbreaks. In fact, water strongly contaminated with sewage might be drunk for an indefinite time without causing cholera or typhoid fever. The real factor which determined the danger or safety of water for drinking purposes was the presence or absence of living germs of disease, and the first step for the prevention of infection of our water supplies with fever poison was not the purification of sewage, but the destruction of the fever germs before they escaped from the sick-room of the patient into the soil, the sewers, or the drinking water. If complete disinfection were carried out in all cases of typhoid fever that disease would rapidly disappear and the dangers resulting from sewage pollution of our water supplies would be greatly reduced. It was imperative that water supplied from any river or other source which had been polluted in the least degree by sewage or organic matter, after adequate storage and sedimentation, should be subjected to complete and carefully managed sand filtration before it was distributed into the water mains. Where a community was able to obtain a water supply free from the possibility of any contamination, instead of one liable to such contamination, that community was bound, for the sake of the safety and the welfare of its citizens, to procure the supply which was above suspicion; and in cases where there was no alternative but to use the water of some adjoining river or other source liable to pollution, no measures should be neglected whereby poisonous and noxious elements might be prevented from finding entrance into the water, and whereby the last traces of such poisonous elements, if they had found entrance, might with certainty be removed through the best means available. He pointed out many defects in the existing Act of Parliament, and alluded to the difficulties which beset local authorities in dealing with the prevention of pollution. He instanced various reforms that were necessary, and, in conclusion, expressed a hope that all concerned in the health and welfare of the nation would urge upon Parliament the necessity of passing the Rivers Pollution Prevention Bill, by which the defective Act of 1876 would be amended and through which we might hope eventually for the total abolition of the pollution of our streams and rivers.

Birmingham Water Scheme.

A paper was read by Mr. James Mansergh on the "Birmingham Water Scheme." The area supplied by the water committee amounted, he said, to 130 square miles, which was 10 per cent. in excess of the county of London. The development of the area made an increased supply absolutely necessary, and in addition the committee had to face the possibility of increasing pollution of existing sources. The remedy seemed to be the acquiring of a distant water supply, and the prospects of abundant water and convenience of gravitation made them hit upon the Elan Valley. When they had so decided there was a necessity for prompt action, for the metropolitan authorities were searching for gathering-grounds for London. For this reason they found opposition to their scheme when it came before Parliament. There was national opposition too, for the Welshmen said that this was Welsh water, which should be reserved for Welshmen. Lord Swansea and Mr. Tom Ellis, M.P., fired off patriotic speeches, and there was an attempt to show that, by reason of elevation and the fall of the watershed, the Elan Valley was the natural ground for the supply of Glamorganshire; but he produced a little model of the locality, and "in ten minutes the Glamorganshire opposition had collapsed." As a nation, therefore, the Welshmen failed, but the individual members of it whose land was required for the works had had their revenge. Radnorshire had spoiled Birmingham to the tune of scores of thousands, and during the last few years a ditty of his childhood had recurred to his memory. It began, "Taffy was a Welshman, Taffy was a thief." They found another difficult class to deal with—the sporting fisherman, who demanded that they should release a tremendous quantity of water into the river. Ultimately it was agreed to release twenty-seven million gallons. Since then the river at the point at which this would be discharged had been

measured, and the flow found to be about four and a half millions, so that the quantity of water passing down would be increased six-fold. The area of the gathering ground to be acquired was fixed after carefully marking the watershed boundaries. The observations of the rainfall on this area satisfied him that they might calculate on obtaining seventy-five million gallons per day for the supply of Birmingham, in addition to the twenty-seven million gallons required for compensation. Mr. Mansergh described the work of damming up the watercourses so as to transform the valley into lakes. These storage reservoirs, he said, would hold sufficient water to provide for a drought of 180 days, or practically half a year. From the reservoirs at Elan to the receptive reservoir at Frankley, a distance of 74 miles, the water will be conveyed by tunnelling, the extent of which exceeds 30 miles, cut and cover, and iron pipes, and the water will be forty-four hours in completing the journey. Mr. Mansergh described the formation of a navvies' village in a situation which gives the water officials complete controlof it. There were stringent regulations which surrounded the admission of strangers and tradesmen to the village, the latter being required to give an undertaking that they would not introduce intoxicating drinks, while Sunday quiet was secured by the prohibition of the sale of any article except milk. The school, which gave accommodation for 168 scholars, had achieved such progress in bringing the navvy's children under discipline and regular instruction that the highest Government grant had been assured. The difficulty of the drink question had been solved by the establishment of a municipal public-house under the direction of a salaried manager, the regulation of the quantity of drink supplied and the persons to whom it was supplied. The profits from this took the place of a school-board rate, maintained the public hall, library, gymnasium, reading-room and recreation grounds, paid the deficit on the bath-house and provided occasional contributions to charitable institutions. As to the social results, while they could not say that they had created a Utopia, they had reduced the evil results of drinking to a minimum, taking into consideration the fact that on the opposite side of the river, within half a mile, there was another public-house on the usual lines.

Sir Joseph Fayrer moved a vote of thanks to Mr. Mansergh for his surpassingly-interesting lecture. It was, he said, one which was not only interesting to the observer of nature and to the scientific person, but to the inhabitants of Birmingham. It was a matter for congratulation to the Congress that the designer and director of those works, which would be a great success, had read the paper before it. He was also particularly struck with the social aspect of the work. So far as he knew, no better arrangement had ever been tried.

VENTILATION AND WARMING.

(*Continued from last week.*)

Alternatives for the System of Cross Ventilation.

I HAVE not attempted to calculate how the necessary amount of heat could be supplied by open fires in ordinary grates. The working of an open fire is seen to the greatest disadvantage in a dormitory where the beds are more or less uniformly distributed over the whole floor space. The distribution of heat from an open fire proceeds wholly by radiation, and only those who can see the fire get any direct advantage from it, though the indirect advantage of warmed walls, floor and ceiling are doubtless considerable. What is still more objectionable is that the inlets being all cold the association of open fires in ordinary grates with ventilation by open windows, results in draughts of the direst description. I do not therefore see any advantage in attempting to cure the coldness of cross ventilation by fires in ordinary grates.

If open fires are employed for warming comparatively large rooms it would be better to use grates supplied by fresh air in some manner more or less similar to that introduced into barracks by Sir D. Galton, to shut up the windows and use only the chimneys as extraction shafts, and pass all the air supply round the grates. We may consider how such a system would work out. We will take 21,000 cubic feet per hour as the air taken by a good-sized chimney, if there are proper inlet openings ; on that understanding one chimney will ventilate seven beds. The fire being a large one will burn, say, 4 lbs. of coal per hour, will produce 56,000 units of heat ; its duty, for a fresh-air grate, according to Morin, is ·35, and therefore ·35 of 56,000, or 19,600 units of heat will be given to the room per hour. This will warm the 21,000 cubic feet of ventilation air through 45 deg. Fahr., making no allowance for loss by conduction through walls and windows. As the air need only be warmed through 18 deg. Fahr., the heat supply is larger than is necessary, and the calculation exhibits a characteristic difficulty incidental to combined ventilation and warming by open fires, namely, that when the ventilation is sufficient there is too much heat. In practice, no doubt, there would have to be a compromise between the ventilation and the warming ; it would be impracticable to adjust matters by opening windows and so trying to supplement the open fire system by means of a cross ventilation system in cold weather, because the secondary head caused by the fires would determine an inward flow through all the openings, and the only course would be to reduce the heating by diminishing the fires, thereby reducing the ventilation. The number of fires for ventilating a dormitory of 100 boys on this system would be fourteen, the amount of coal consumed 56 lbs. per hour, so that it would be extravagant as compared with the hot-water pipe system ; moreover, the labour of attending to so many fires makes it inappropriate. It would have the very great advantage of making the ventilation practically independent of the wind, but a more advantageous arrangement, with the same result, would be obtained by a redistribution and consolidation of the work on some such plan as the following :—The fourteen chimneys to be replaced by one large chimney stack, such as is used for factories, the suction to be distributed by means of trunks carried along walls or ceilings, the fires to be concentrated in a furnace under a boiler, and the heat to be distributed by hot-water pipes placed in front of the fresh air inlets. Upon such a plan a very serviceable system of ventilation could be constructed.

Having been thus incidentally led to consider a substitute for the system of cross ventilation, it will be well that I should here mention the possibility of using mechanically driven blowing machines as a substitute. This would be practically equivalent to using a gas-engine or dynamo, driving a blower, to propel air into the dormitory instead of using the suction of the large chimney to extract the air. I hesitate to regard such an arrangement as suitable for dormitories. Whatever apparatus is adopted ought to run for eight hours or nine hours every night without attention. I confess that there are some circumstances about the Poor Law schools which make mechanical ventilation peculiarly appropriate to them. Except for the times when the children are out of doors there is always the same number of children requiring air ; they are simply redistributed at different periods of the day or night. For a school of 500 children a central fan delivering 150,000 cubic feet of air could be kept running day and night, and with a suitable arrangement of channels the air could be easily made to follow the children from the dormitory to the breakfast hall, from the hall to the schools, and so on. The arrangement would need and could have constant attention, and I have no doubt that in a new building it could be satisfactorily arranged. To introduce such a system into an existing building is a much more difficult matter. I do not regard its piecemeal introduction to individual dormitory wards as being the easiest or most satisfactory solution of the general problem with which this inquiry deals.

Summary.

I have now completed the examination of the system of cross ventilation upon which all the Poor Law schools practically rely. I have shown that it is not properly applicable to very wide dormitories; that in the narrower dormitories, where it gives as a rule satisfactory results as regards quantity of air, the system fails as regards the temperature of the air supplied in cold weather, and it fails also as regards quantity of air in calm weather. I have computed the heat supply which should be furnished to provide for the coldest ordinary weather, and I have indicated some alternatives that might be adopted. I will call the alternatives the open-fire system, the factory-chimney system and the mechanical system. It remains to be considered whether the system of cross ventilation can be so modified in the buildings as they stand as to make it reasonably satisfactory as regards warmth as well as ventilation, or whether, if adequate ventilation is to be insisted upon, the system should be abandoned in favour of the open-fire system, the factory-chimney system or the system of mechanical ventilation. I am of opinion that the system of cross ventilation should be retained for the narrower dormitories, and that it should be supplemented by hot-water radiators under the windows. Provision should be made for the windows being opened some 8 inches at the top, the opening having in front of it a perforated zinc screen, the perforations being a quarter of an inch in diameter, and the screen being fixed so that it can easily be cleaned on both sides. This would distribute the incoming air over about twice the area that an uninterrupted stream of the same volume would occupy, and therefore would facilitate its mixing with the column of warm air rising from the radiator. The opening may be obtained either by drawing down a window-sash, in which case a frame containing the perforated zinc should be close to the window frames. Or the top of the window may be a hopper light, and opening inwards fall against the frame of the perforated zinc when fully opened. The second arrangement affords better protection against the weather.

In order to provide for ventilation in calm weather special provision is necessary. For this purpose some arrangement for differentiating the windows into inlets and outlets is required, but the arrangement must not interfere with the use of any window in either capacity when the wind supplies the necessary motive power. I would propose to make the provision by dividing the windows into upcast and downcast ventilators. For that purpose I would suggest doubling the glazing of all the windows on one side. If the windows face north and south those on the south side should be doubled, if they face east and west those on the west side. The second frame should be set on side brackets, leaving a free space between the bottom of the frame and the window-sill, so far from the wall that the hot-water coil or radiator is vertically under the opening between the frame and the sill. The lower half of the inner window should be a sliding sash. The upper half should have a hopper light falling into the space between the windows and leaving an 8-inch vertical opening protected by perforated zinc.

I contemplate the hot-water pipes being used on comparatively few days in the year, and used to their full power on very few days indeed.

These arrangements may be applied to dormitories of less than 25 feet in width. I am of opinion that, with the present regulations as regards cubic space, the rooms will then be suitably warmed and ventilated practically the whole year round, provided that the apparatus be used with judgment. I believe the introduction of the double glazing on the sunny sides will be found very materially to reduce the heating effect of the sun and promote ventilation in summer.

For dormitories beyond 24 feet in width the same arrangements may be adopted with a larger window opening, viz. 1 foot instead of 8 inches; but I am of opinion that in their case the necessary allowance of cubic space per bed should be increased. My observations are not sufficiently extended to warrant any final conclusion as to the proper amount of cubic space to be allowed. The third row of beds might have one and a half times the space of the first two rows, the fourth row twice as much space, the fifth, sixth and seventh rows three times as much.

This would give a rule of allowance of cubic space, adjusted to the width of dormitories, approximately as follows:—

For every 100 cubic feet of space allowed to each bed in a dormitory not exceeding 24 feet wide,

110 cubic feet per bed should be assigned in a dormitory between	24 feet and 30 feet wide
130 cubic feet per bed should be assigned in a dormitory between	30 „ „ 36 „ „
140 cubic feet per bed should be assigned in a dormitory between	36 „ „ 45 „ „
160 cubic feet per bed should be assigned in a dormitory between	45 „ „ 54 „ „

A dormitory which is not adapted for cross ventilation, and which is not otherwise adequately provided, should, for the purpose of computing the allowance of cubic space, be treated as on the same footing as a dormitory of three times its own width, that is to say, a dormitory with windows on one side only and 18 feet wide should have the same allowance of cubic space per bed as a dormitory 54 feet wide, viz. 160 cubic feet for every 100 allowed in a narrow dormitory with provision for cross ventilation.

With the modifications suggested the ventilation, and more particularly the warming, would need intelligent management. It is almost universal for powerful heating apparatus to be abused by being employed when it is not wanted. I would propose to meet the difficulty by the issue of a card of instructions as regards warming and ventilation to be hung up in the room.*

I have endeavoured to keep in view the existing allowance of cubic space in the narrower dormitories, and to suggest arrangements that shall provide efficient ventilation without extending the allowance. Whether it be advisable to maintain the existing rules ought to depend upon the manner in which the system of cross ventilation works out in practice, when it is modified so as to provide for the adequate warming of the rooms. One point, however, ought to be mentioned. The coils or radiators ought to extend the whole width of the windows, and they will occupy in consequence a good deal of wall space. It is desirable that these coils should be as freely exposed to the room as possible, and easily accessible for cleaning. To set a bed immediately in front of and close to each one would not be a good arrangement. It is therefore desirable to make such allowance of cubic space as to make it possible to leave free space in front of the radiators.

*Possibly the organisation of a "ventilation drill" for some of the elder children might be an effective means of obtaining the best results from the use of the apparatus.

Wide Dormitories.

For dormitories more than 30 feet in width it would be desirable to have some other way of ventilating that might be adopted as an alternative to diminishing the certified accommodation. The precise plan to be recommended would depend upon many circumstances. For Edmonton, which would have to deal with the large boys' dormitory, to warm the girls' and the infants' dormitory, and to arrange for the two dormitories in the old house, which are not adapted for cross ventilation, a wide factory chimney would, in my opinion, afford the best solution. The chimney might not inconveniently be placed on the land between the buildings and the stream, and trunks led into it from the boys' dormitories; it would serve as a boiler flue for the hot-water pipe system, but the chimney should be much wider than is required merely for that purpose, and should be carried some 30 feet above the roof. There should be provision for supplying heat to the chimney when the boiler fire is not required. The distribution of rooms at Edmonton would also lend itself easily to ventilation and warming on the mechanical system.

Infants' Dormitories and Nurseries.

The considerations as to temperature, brought forward in the foregoing pages, have had reference to dormitories intended for the older children. For infants and babies the minimum temperature assigned would be much too low. For these a normal temperature of 58 deg. to 60 deg. is appropriate, and a minimum temperature of 50 deg. may be assigned, and the additional 10 deg. must be furnished by additional length of coil, or, as the heating available when employed at full power is more than sufficient for ordinarily cold weather, the existing open fires may be used in the coldest weather to supplement the heating of the rooms supplied with the normal amount of hot-water pipe.

Artificial Lighting.

In arranging for ventilation allowance ought to be made for the air required on account of artificial lighting. In the schools which I have visited the universal illuminant is gas. In dealing with dormitories I have made no allowance on that account, because at most there appears to be a single jet burning for each thirty occupants. It is better to have the gas fumes led away directly from the room by a suitable flue, and this is done already in many cases. The small amount of gas employed without special extraction need not affect the general considerations here put forward.

Existing Air Inlets and Extraction Flues.

The system which I have sketched out for ventilating and warming the dormitories is intended to enable the rooms to be adequately ventilated even in the coldest weather. On such occasions the active circulation of air caused by the hot-water coils will, I believe, dispense with the necessity for special openings near the floor for the purpose of ventilating the lower part of the room, and such as are provided may then be temporarily closed when they are found to cause cold draughts. For this purpose suitable covers may be provided, which can be opened or closed as may be found desirable. The best plan that I am acquainted with for securing this is to provide a wooden or iron sliding drawer to fit the opening. The drawer need have neither back nor top nor bottom, only a front and two sides, held together by a narrow bar passing from side to side. A plug may be secured in the top or bottom of the opening, which will prevent the drawer being entirely withdrawn. For an opening 6 inches wide it will be sufficient if the drawer pulls out so as to leave 3 inches clear at top and bottom. Suitable drawers of wood could readily be made in the carpenters' shops of the several schools. With an arrangement of this kind it is quite easy to see whether the ventilators are open or shut, and to shut them while cleaning is going on in the room, so as to prevent the dust accumulating in them. It is also easy to get at the openings behind them.

It is not desirable to close permanently the openings already existing, for in the summer openings at different levels are of great value, and for the warmer nights of spring and autumn they would be serviceable.

Recommendations as to Dormitories.

In accordance with the views set forth in the foregoing pages I beg leave to make the following recommendations with regard to dormitories:—

A.—1. That all air ducts, perforated skirting, extraction flues, radiators and other appliances for the supply or extraction of air (including air-bricks behind existing steam pipes), or for warming, be cleaned, and provision be made for facilitating their cleaning in future.

2. That provision be made for suspending in each dormitory a card enumerating the appliances for ventilation and for warming with which the dormitory is supplied, and giving

directions for their use and for the periodical cleaning of all air ducts.

3. That in case there are latrines or closets adjoining the dormitories, provision be made for a flue leading from near the ceiling of each closet up to and above the roof, and for a gas jet so arranged that the heated air from it passes directly into the flue, but not so that the gas jet is contained within the flue itself, nor so that all the air passing into the flue goes past the gas flame.

A lantern with a chimney, narrower than the flue, ending just at the commencement of the flue, would be satisfactory.

B. For Dormitories adapted for the System of Cross Ventilation.—1. That provision be made for supplying the dormitories with hot-water coils or steam coils (preferably the former) to the extent of from 5 to 10 feet of 2-inch pipe for each bed, arranged as radiators under each window. The radiators to extend the whole width of the window. The connecting pipes between the radiators to be protected to prevent them supplying heat to the room.

2. That provision be made for double glazing the windows on the south side or west side of the dormitories after the manner (generally speaking) indicated in the drawings.

3. That for dormitories more than 24 feet in width and for narrower dormitories not adequately provided with means for cross ventilation, the allowance of cubic space be increased.

4. That suitable covers be provided for floor ventilators and for other ventilators which give direct communication with the outside air through the walls of the dormitory.

C. For Dormitories which cannot be adequately Ventilated by Cross Ventilation.—That provision be made for ventilation by the "factory chimney" method or by "mechanical ventilation."

ARCHITECTURE AT KING'S COLLEGE.

THE following is the report of Professor Banister Fletcher, which was read at the distribution of prizes to the students of the architectural, building construction, studio and wood-carving classes of King's College on Friday last :—I have to report that the competition for the free scholarships, the gift of the Worshipful Company of Carpenters, took place in this college on Monday last. There were ten candidates, of whom eight sat for examination.

The result of the examination was as follows :—A. J. Wade was first with 104 marks out of a possible of 120, and G. H. Briggs was second with 103 marks. The work of the remaining students was good, in fact, four obtained more than two-thirds.

It has become so much the rule upon such a meeting as this to lay before you some figures showing the growth or decrease of the classes that, at the risk of tiring you, I am compelled to follow the custom and give you briefly the results.

Number of Students entered attending the Classes.

Session 1892-93	28
,, 1893-94	42
,, 1894-95	75
,, 1895-96	120
,, 1897-98	145

The individual students making these 145 entries number 84.

In the wood-carving classes the following are the figures :—In the day classes the instructor reports :—"I have much pleasure in reporting this year an extension of my list of pupils as compared with the previous year. During the year 1896-67 I had a total of 59 pupils, or an average per term of 19⅔, while during the year just concluded my pupils numbered in the aggregate 63, giving an average per term of 21." In the evening classes the instructor reports :—"A slight increase in members; there are now 60 students." The judges report that at the examination of the work submitted in both the day and evening classes there was a marked advancement in the craftsmanship.

The attendance at the several classes has been good and regular, notwithstanding the many inducements for pleasure that now exist; the reduction of the vacations between the terms has, I believe, been of great assistance in obtaining this improvement in attendance. We are this evening dealing with prizes and certificates won upon the college examinations, but I think it only right that mention should be made of the results obtained by such of our students who have sat for outside examinations, the proportion of failures being but 15 per cent.

Government appointments, surveyors—3 sat, all passed. Surveyors' Institute—1 sat, 1 passed. Institute of British Architects—4 have become probationers, 3 have passed the intermediate, and others are preparing for the November examination for the R.I.B.A. degree. City and Guilds—5 sat, 4 passed. Science and Art examinations—4 sat, 3 passed.

Architectural History Class.—We have had the full number to which I limit this class.

The following are the prize-winners :—F. G. Pain, gold medal; C. J. T. Dadd, silver medal and 3*l.* in books; W. Marchment, bronze medal and 2*l.* in books; W. G. Trew, certificate of distinction and 1*l.* in books. The reason a gold medal is given is that the student obtained first place in the examination for three consecutive years.

Architectural History Drawing Class.

The number of drawings prepared in this class is fifty. The prize-winners are :—C. J. T. Dadd, certificate and 2*l.* in books; W. G. Trew, certificate and 1*l.* in books. I can hardly speak too highly of the attention and earnestness of all the students.

A pleasing feature in our classes is the fact that very many of our students are not satisfied with one course, but are to be found again a second year working with renewed vigour in some special class or classes. That our classes are conducted with a view to embrace such teaching as will be most useful under all the various circumstances one has but to take at random any class and notice the several trades and professions of the students.

As an example we have one in the following :—One fellow of the Surveyors' Institute, one associate of the Surveyors' Institute, one associate of the Institute of British Architects, two School Board teachers, six architectural assistants, two plumbers, four carpenters, two masons, one telegraphic clerk, three clerks.

As to the far-reaching influence of our classes, I would also mention that among our students some come from Windsor, Guildford, Addlestone, Bromley, Gravesend, Stevenage and all parts of the postal district of London. The establishment of these evening classes in the session of 1892-93 was really a pioneer of the great educational movement that has resulted in the formation of the numerous huge polytechnics. In the face of this growing and keen competition, the fact that we are enabled this evening to place before you such a record is, I think you will agree, most encouraging, more so as upon looking over the list of teachers in kindred subjects held at the several polytechnics, we find therein men who have been through our classes here, and who must accordingly be strong competitors.

With regard to the architectural studio, which is open every day and evening, it has continued to be of great use to the students. It has been attended by eighteen students, and much good work has been done, as you will see by the exhibited work. One point has been in the satisfactory increase of the day students. Many of the students are preparing their testimonies of study for the R.I.B.A. examinations, while others simply come and improve their powers of design and drawing, and make practical working drawings of buildings to be erected. Many friendships are formed, too, which remain through life, and the encouragement which the students give to each other is of great value. Many of the students have obtained important posts after leaving the college, both at home and abroad, and I can confidently recommend all students to take the studio course. The possession of such a unique collection of models, drawings, diagrams and photographs (the number added this year is 829) as we possess, including the magnificent Scott collection, must always be an incentive to good work, and I am somewhat confident that you will agree upon examining the students' work to-night there is reason to be pleased with the result. We are ever anxious to still increase our numbers and classes, and trust with your assistance to come before you next year with another increase.

The classes reassemble as follows :—

October 3.—Studio, 6 P.M.; building construction lectures, 7 P.M.; constructional drawing, 8 P.M.

October 5.—Architectural history lecture, 7 P.M.; architectural sketching class, 8 P.M.

October 7.—Quantity class, 6.30 P.M.

It is usual to give to intending students a few words of advice. Last week some of you may have seen that the Poet Laureate, in unveiling a monument to the father of English poetry (Cædmon), said he had the great advantage of being "wholly unencumbered with the lumber of learning," and, it may be, some have thought in other walks of life learning may be dispensed with. Without deciding the difficult question of the poet, whom we have heard is so different from the rest of mankind, I cannot too forcibly remind you that it is impossible to get on in life without the lumber—and a very great quantity thereof—nor is it possible to acquire such lumber save only in early youth; that the man who neglects that period can only acquire knowledge with very much greater difficulty, if at all. With one more remark let me conclude. I have referred to it before, but not, probably, in such emphatic language as Dr. Garnett did recently in a paper he read before the London Chamber of Commerce. He said the German looks upon his business career as his life; the English boy merely regards it as a means of getting money to enable him to live. This is the reason of the great success of the former. Rest assured that only those can hope to attain great success who love learning for its own sake and the pleasure that it gives.

A NATIONAL PHYSICAL LABORATORY.

THE report of the committee appointed by the Treasury to consider the desirability of establishing a national physical laboratory has appeared. The committee consisted of Lord Rayleigh (chairman), Sir Courtenay Boyle, Sir Andrew Noble, Sir John Wolfe Barry and Messrs. W. C. Roberts-Austen, Robert Chalmers, A. W. Rücker, Alexander Siemens and T. E. Thorpe. After briefly reviewing the origin and scope of the work of the Board of Trade laboratories, the report says :—

In general the committee are of opinion that the appliances and facilities of the Standards Office and of the Electrical Standardising Laboratory are fairly adequate for the performance of their statutory duties. They understand, however, that on account of the want of means for the chemical analysis of the materials used in the construction of standards, those offices would find some difficulty, without extraneous assistance, with regard to any new standards that might be required.

They further desire to point out that many physical constants and data and numerical expressions are necessarily used in connection with standards and the standardising of instruments. Some of the data now in use at the Standards Office are known to require correction, and in the case of others further investigations appear to be desirable. There is, however, no legal obligation on the Board of Trade to establish new data and numerical expressions, and in consequence of the smallness of the staff of the office the work of the department is limited to that which is strictly enjoined by the Acts of Parliament. The department is at the present time chiefly dependent for more exact knowledge on such investigations as may be undertaken at the Bureau International des Poids et Mesures at Paris, or by foreign institutions similar to that contemplated in this country.

There is much evidence that further facilities are needed by the public for the standardising and verifying of instruments, both for scientific and commercial use ; and also that it would be of great benefit to trade if means were provided for the public testing of the quality of certain classes of materials. In particular the committee desire to draw attention to the evidence which has been laid before them as to the difficulties arising in certain Government departments in their dealings with contractors and others which might be overcome by the establishment of an independent testing authority. It would neither be necessary nor desirable to compete with or interfere with the testing of materials of various kinds as now carried out in private or other laboratories ; but there are many special and important tests and investigations into the strength and behaviour of materials which might be conducted with great advantage at a laboratory such as is contemplated in the reference. As illustrations we may mention investigations into the behaviour of metals and other substances under continuous or alternating stresses, which investigations are not, so far as we know, conducted at the present time at any testing institution in this country, and which could only be undertaken with satisfactory and authoritative results at a public laboratory.

After consideration of the evidence the committee have come to the conclusion that an institution should be established for standardising and verifying instruments, for testing materials, and for the determination of physical constants. Work useful both to science and industry could therein be performed for which no adequate provision is at present made, either in this country or at the Bureau International des Poids et Mesures. Such work could not, or, at all events, in all probability would not, be undertaken by individual workers, or by institutions primarily devoted to education. In the opinion of the committee the proposed institution should be established at the national expense on lines similar to, though not at present on the scale of, the Physikalisch-technische Reichsanstalt. The possibility of future extension should, however, be kept in view from the first.

To secure the efficient performance of the work, the committee are of opinion that the director of the institution should be a man of high scientific attainments, and should act under a governing body containing representatives of both science and industry. The director should not be called upon or allowed to undertake work not connected with the institution except with the consent of the governing body. He would require the support of an adequate staff. As regards locality, while it is desirable that the institution should be near London, it is necessary that the site be free from mechanical and electrical disturbance.

Among the most important questions considered by the committee was whether the proposed institution should be founded independently or should be a development of an existing institution. The duties of the Board of Trade, as custodian of certain standards, are defined by statute, and the committee consider that it is undesirable to alter existing arrangements in this respect. They are of opinion that the proposed laboratory, if established, should be managed by a governing body constituted and appointed as hereinafter described, and should not be under the direct control of a Government department. They recommend that the Board of Trade, as custodian of the standards, should be placed in close connection with the said governing body.

The character of the work done at the Kew Observatory suggests that all that is really necessary might be attained by the development of that institution.

The report concludes with the following recommendations :—

1. That a public institution should be founded for standardising and verifying instruments, for testing materials and for the determination of physical constants.

2. That the institution should be established by extending the Kew Observatory in the Old Deer Park, Richmond, and that the scheme should include the improvement of the existing buildings and the erection of new buildings at some distance from the present observatory.

3. That the Royal Society should be invited to control the proposed institution, and to nominate a governing body, on which commercial interests should be represented, the choice of the members of such body not being confined to Fellows of the Society.

4. That the permanent secretary of the Board of Trade should be an *ex officio* member of the governing body ; and that such body should be consulted by the Standards Office and the Electrical Standardising Department of the Board of Trade upon difficult questions that may arise from time to time, or as to proposed modifications or developments.

TESSERÆ.

Early Engraving.

EVELYN says the art of engraving and working off from plates of copper did not appear till about the year 1490. That is, it was not brought to perfection from the hints gathered from typography ; yet it is certain that in 1460, Maso Finiguerra, a goldsmith of Florence, by an accident that might have given birth to the rolling-press, without the antecedent discovery of printing, did actually light upon the method of taking off stamps from an engraved plate. Casting a piece of such plate into melted brimstone, he observed that the exact impression of the engraving was left upon the surface of the cold brimstone, marked by lines of black. He repeated the experiment on moistened paper, rolling it gently with a roller. It succeeded. He communicated the discovery to Baccio Baldini, of his own profession and city. The latter pursued the invention with success and engraved several plates from drawings of Sandro Botticelli, which being seen by Andrea Mantegna, he not only assisted Baldini with designs, but cultivated the new art himself. It had not long been in vogue before Hugo da Carpi tried the same experiment with wood, and even added a variety of tints by using different stamps for the gradations of lights and shades. From Italy engraving soon travelled into Flanders, where it was first practised by Martin, of Antwerp. He was followed by Albert Dürer, who carried the art to a great height, considering how bad the taste was of the age and country in which he lived. His fidelity to what he saw was at once his fame and misfortune ; he was happy in copying nature, but it was nature disguised and hid under ungraceful forms. With neither choice of subjects nor beauty, his industry gave merit even to ugliness and absurdity. Confining his labours almost wholly to religious and legendary histories, he turned the Testament into the history of a Flemish village ; the habits of Herod, Pilate, Joseph, &c., their dwellings, their utensils and their customs were all Gothic and European. Lucas, of Leyden, imitated him in all his faults, and was still more burlesque in his representations. It was not till Raphael had formed Marc Antonio that engraving placed itself with dignity by the side of painting.

Land-bocs.

Our ancestors before the Norman Conquest pursued no system of public registration, though there are numerous charters of the Anglo-Saxon kings and deeds between private individuals still existing, and historical events are found chronicled in monastic chartularies. The Anglo-Saxons, whose judicial proceedings were conducted orally, had no records except the "land-bocs" or charters. The transactions of the folk-moots were not registered or recorded, and in the administration of justice no reference was made to written precedents. In such a state of society, though the actual possession of land constituted one of the best titles to real property, still the "land-boc" furnished evidence of it also. And so important were these "land-bocs" considered, that when the monks of Ely purchased seven hides and a half of land, they gave three hides besides thirty "aurei" to recover the charter or "cyrograph" of the title. Duplicates and triplicates of these "land-bocs" were made, and one part was delivered into the custody of the burthegn, or chamberlain, to be preserved in the "horde," or royal treasury. When a written account is made of any act, it is clear that it is made

not for the exclusive benefit of one party only. In the Domesday book of the Norman Conqueror we see evidence that his power was far from absolute. The financial registrations (Rotuli Pipæ) of Henry I., in whose reign the earliest example is found—the records of the judicial proceedings of the "Curia Regis," which begin with Richard I.—and the special acts of the monarch himself enrolled on the "close," "patent" and "charter" rolls commencing in the reign of John—are all so many irresistible proofs how gradually larger interests were trenching on the will of the king, who formally recognised no other power than his own in the government of the kingdom. The judicial records of the King's Bench and Common Pleas, and the Parliamentary records beginning with Edward I., are further evidence of the increasing influence of the nobles and commonalty of the realm.

Harmony of Colours.

All the modes of harmony, or of producing that effect of colours which is required in a picture, may be reduced to three, two of which belong to the grand style and the other to the ornamental. The first may be called the Roman manner, where the colours are of a full and strong body, such as are found in the *Transfiguration*; the next is that harmony which is produced by what the ancients called the corruption of the colours, by mixing and breaking them till there is a general union in the whole without anything that shall bring to remembrance the painter's palette or the original colours; this may be called the Bolognian style, and it is this hue and effect of colours which Lodovico Carracci seems to have endeavoured to produce, though he did not carry it to that perfection which we have seen since his time in the small works of the Dutch school, particularly Jan Steen—where art is completely concealed and the painter, like a great orator, never draws the attention from the subject on himself. The last manner belongs properly to the ornamental style which we call the Venetian, being first practised at Venice, but is perhaps better learned from Rubens; here the brightest colours possible are admitted with the two extremes of warm and cold, and those reconciled by being dispersed over the picture till the whole appears like a bunch of flowers. From the Dutch school the art of breaking colour may be learned. Attention should also be given to the works of Watteau for excellence in this florid style of painting. To all these different manners there are some general rules that must never be neglected. First, that the same colour which makes the largest mass be diffused and appear to revive in different parts of the picture, for a single colour will make a spot or blot. Even the dispersed flesh colour which the faces and hands make requires a principal mass which is best produced by a naked figure; but where the subject will not allow of this a drapery approaching to flesh-colour will answer the purpose, as in the *Transfiguration* where a woman is clothed in drapery of this colour, which makes a principal to all the heads and hands of the picture, and for the sake of harmony the colours, however distinguished in their light, should be nearly the same in their shadows. And to give the utmost force, strength and solidity to the work some part of the picture should be as light and some as dark as possible; these two extremes are then to be harmonised and reconciled to each other. Instances where both of them are used may be observed in two pictures of Rubens, which are equally eminent for the force and brilliancy of their effect; one is in the cabinet of the Duke of Rutland, and the other in the chapel of Rubens at Antwerp, which serves as his monument. In both these pictures he has introduced a female figure dressed in black satin, the shadows of which are as dark as pure black, opposed to the contrary extreme of brightness, can make them. If to these different manners we add one more, that in which a silver grey or pearly tint is predominant, every kind of harmony that can be produced by colours will be comprehended.

Inigo Jones's Disinterestedness.

Webb declares that Jones was neither arrogant nor ambitious, nor exulted in his knowledge and his learning; on grounds which are at least equally sure he claims for him a nature generous and noble. Of this he gave a strong proof soon after his appointment. "The office of His Majesty's works," says his son-in-law, "of which he was supreme head, having through extraordinary occasions, in the time of his predecessor contracted a great debt, amounting to several thousand pounds, he was sent for to the lords of the Privy Council, to give them his opinion what course might be taken to ease His Majesty of it, the exchequer being empty and the workmen clamorous. When he of his own accord voluntarily offered not to receive one penny of his own entertainment, in what kind soever due, until the debt was fully discharged. And this was not only performed by him himself, but upon his persuasion the comptroller and paymaster did the like also, whereby the whole area was discharged." This Roman disinterestedness, as Walpole calls it, proves that the architect had other means of subsistence than his salary as surveyor; but he was never rich, and though he is upbraided by Philip, Lord Pembroke, with having sixteen thousand a year for keeping the palaces in repair, there is no proof that the bargain was profitable or that he gained more than the bare Government pay of 8*s.* 4*d.* per day, with an allowance of 46*l.* a year for house rent, besides a clerk and incidental expenses. "What greater rewards he had are not upon record," observes Walpole; "considering the havoc made in offices and repositories during the great civil war, we are glad at recovering the most trivial notices." His savings could not be large from his salary, and he was too generous to profit by the liberal spirit of his master, who was the poorest king of the richest nation in Europe. Of his modesty respecting the perquisites of his place there is a proof which no one will doubt, to wit, a written testimony by King James in the British Museum. "Whereas," says this document, "there is due unto Inigo Jones, esquire, surveyor of His Majesty's works, the sum of 38*l.* 7*s.* 6*d.* for three years arrears of his levy out of the Wardrobe, as appeareth by three several debentures; these are therefore to will and require you to make payment unto the said Inigo Jones or his assignees, and for so doing this shall be your warrant." For three years the king was unable to pay the annual price of his surveyor's livery, and the latter had the modesty and the forbearance to wait till accident or the tardy liberality of the Commons replenished the exchequer with the sum of 38*l.* 7*s.* 6*d.*

Fitness and Proportion.

Every form which is susceptible of proportion may be considered in either one or other of the following lights. First, in the light of its whole or general relation to the end designed, or when it is considered as a whole, without any distinction of parts; or, secondly, in the light of the relation of its several parts to this end. Thus, in the case of a machine, we may sometimes consider it in the light of its general utility for the end it is destined to serve, and sometimes in the light of the propriety of the different parts for the attainment of this end. When we consider it in the first light it is its fitness which we properly consider. When we consider it in the second light it is its proportion we consider. Fitness may therefore be supposed to express the general relation of propriety between means and an end, and proportion a peculiar or subordinate relation of this kind, viz. the proper relation of parts to an end. Both agree in expressing the relation of propriety between means and their ends. Fitness expresses the proper relation of the whole of the means to the end. Proportion, the proper relation of a part or of parts to their end. Where we have no acquaintance with the fitness of any form we have no sense of its peculiar proportions. No man, for instance, ever presumes to speak of the proportions of a machine of the use or purpose of which he is ignorant. When a new machine is shown us we may pronounce with regard to the simplicity or the complexness of its construction, but we never venture to pronounce with regard to the propriety or impropriety of its proportions. When our acquaintance is greater with the uses or purposes of any particular class of forms than the generality of people, we are sensible of a greater number of pleasing proportions in such objects than the rest of the world, and the same parts which others look upon with indifference we perceive as beautiful from our knowledge of the propriety of their construction for the end designed.

Early Stained-Glass.

In the earlier glass paintings, both Early English and Decorated, the material of which is very unevenly blown, it would seem that the artists were content with the sparkling effect thus naturally produced, and abstained from the use of diaper patterns; this is particularly the case with shields of arms: but that in proportion as the material became more refined in its manufacture, they multiplied ornaments of every kind in their works. The ruby glass was generally left untouched, out of consideration probably for its streaky appearance, which rendered any further enrichment unnecessary.

GENERAL.

Mr. W. Goldstraw, building surveyor to the Liverpool Corporation, is to be presented with the sum of twenty-five guineas in appreciation of the excellent manner in which he has carried out the erection and completion of the labourers' dwellings in Gildart's Gardens, Purcell Place and Kearney Place, in accordance with the scheme prepared by the former city engineer.

The New Reredos at St. Barnabas Church, Clapham Common, has been opened by the Bishop of Rochester. It is constructed of Caen stone, inlaid with polished alabaster. The sculptured group represents "The Last Supper," with richly carved canopies, and is of the Early Decorated style.

The Reopening and rededication of St. Mary's Chapel, Aberdeen, the lower church of the ancient parish church of St. Nicholas (which was consecrated by Bishop Elphinstone just 400 years ago), took place on Saturday afternoon. The work of restoring the crypt cost 654*l.*

The Liverpool Council Chamber is to be altered at an estimated expense of 8,000*l.*

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

NEW ISSUE.

The prospectus has been issued this week of The (New) N.A.P. Window Company, Limited. The share capital is fixed at 200,000*l.*, divided into 80,000 Six per Cent. Cumulative Preference Shares of 1*l.* each, and 120,000 Ordinary Shares of 1*l.* each; 50,000 shares of the capital of the company are reserved for working capital, of which 30,000*l.* is already guaranteed. The vendors have agreed to accept, if required, the whole of the Ordinary shares in part payment of the purchase consideration, and stipulate that at least 40,000 Ordinary shares shall be allotted to them, this number being the largest proportion allowed by the Stock Exchange authorities. 160,000 shares are now offered for subscription, 80,000 of which are Six per Cent. Cumulative Preference Shares of 1*l.* each and 80,000 are Ordinary shares of 1*l.* each. The directorate is an eminently practical one, consisting of the following gentlemen:—Major-General G. F. Blake (deputy chairman, Britannia Works, Lim.), chairman; Messrs. J. Starkie Gardner (director, London Southern Tramways Company), Art Metal Works, Albert Embankment, S.E.; Robert B. Maltby (director, New Carbrook Steel Works, Limited), The Hall, Swinton, Yorkshire; Sidney Marler (director, Waring & Gillow, Limited), 176 Sloane Street, S.W.; Thomas F. Rider, C.C. (president (1897) Nat. Assoc. of Master Builders of Great Britain), 181 Union Street, Southwark, S.E.; the Right Hon. the Earl of Westmorland (director, New Peterborough Brick Co. Lim.), Apethorpe Hall, Wansford Northamptonshire; and Mr. W. Youlten (managing director to the vendor company), 159 Victoria Street, Westminster S.W. (whose services have been secured as managing director to this company for a period of five years). The solicitors are Messrs. Ashurst, Morris, Crisp & Co. (for the company), 17 Throgmorton Avenue, E.C. With such sponsors, and in view of the excellence of the N.A.P. window, and the rapidly increasing appreciation of and demand for it which exists, it is very safe to predict a successful *début* and career for the new company.
